With her savings, Leola bought a bedroom suit and rug for one room. She made curtains, put a rod in the closet for hanging clothes and repainted and refinished several pieces of furniture. She took pictures from the wall that were too large and hung smaller ones at the correct height on the wall. She grouped them over pieces of furniture in the room.

Another project that Leola worked on last year was a garden. Out of the garden, 300 cans of vegetables were stored for winter use. She filled 500 cans with fruits, vegetables and meats. Leola is assistant secretary of the Graham Community 4-H Club.

Small Feed Mills Considered Wise Farm Investments; Easy to Operate

By Kenneth B. McPherson

The economy or grinding feed for livestock is generally recognized in this part of the country. If a farmer does not own a feed grinder, he either takes his grain to a customs mill or pays the operator of a portable mill to come to his farm and grind his feed. In either case, considerable time and cash are both expended.

A great many of the mills now located on farms are large in size and require considerable power for operation. Most of them are run by the farm tractor, or a large gasoline power unit with horsepower ratings ranging from 15 to 30.

Several inquiries are received each month during the fall and winter grinding season relative to operating feed mills with electric motors. A majority of these questions come from farmers who own one of the large mills.

Nearly all of the rural electric distribution lines are single phase lines on which only single phase motors can be used. This limits the size of farm motors to seven and one-half horsepower maximum. In almost every case even a seven and one-half horsepower motor is too small to drive a large hammer mill with any degree of satisfaction.

There are, however, several manufacturers who make feed grinders that are specifically designed for small electric motor drive. Mills of both the hammer and knife type are on the market which are successfully operated by motors ranging in size from one to seven and one-half horsepower.

Several lively discussions have been heard between dairymen on the subject of the large versus the small feed grinder. The large grinder man likes to finish the job in a hurry and grind large and bulky quantities at one time for future feeding. He generally admits that his machine investment is high and that it takes a lot of time on a cold winter morning to fill the tractor with water.

The small mill man likes the low cash investment, the convenience of grinding small amounts as he needs it, thus having fresh feed all the time. The electric mill is ever ready at the push of the button.

No one will deny that ear corn with the shuck on is hard to crush but many farmers are doing it with small mills. Anyone can expect to grind around 600 pounds of ear corn per hour, using a one-half inch screen and a three horsepower motor. A high speed mill and a five horsepower motor will consistently deliver 1,300 pounds of ear corn per hour and a seven and one-half horsepower motor can be counted on for a ton. This is through a one-half inch screen which is probably smaller than necessary.

In some sections there is a decided swing to small hammer mills powered with motors under seven and one-half horsepower for all kinds of grinding. The, reasons are: low cost of mills, lower cost of motors, less expensive wiring required, lower cost of power, freshly ground feeds, no waiting when feed is needed, and less spoilage. There has been a vast improvement in small mills in the past few years.

These small mills are farm mills. They will grind hay and corn stalks at moderate rates of speed. They are excellent for shelled corn and all small grains and are real labor savers when properly connected through spouts to overhead bins.

Any farmer who uses ground feed should consider a small mill with an open mind. He might be surprised at how well it fits into his operation.

"What's the idea of the Greens' having French lessons?"

"They've adopted a French baby, and they want to understand what it says when it begins to talk."

"Why did you tip that girl so much when she gave you your coat?"

"Look at the coat she gave me!"

Soybean Oil Yields Abundant Vitamin E

NEW YORK —(AP)— A simple process of separating vegetable and animal oils has opened a rich source of vitamin E, heretofore on the scarce list, Dr. Herbert Passino, associate research director of M. W. Kellogg & Co., said in an interview yesterday.

The process is known as the Solexol System and uses propane gas the (kind you cook with) as a solvent to break oils into fractions or component parts.

When applied to soybean oil, one pound of vitamin E concentrate per 100 pounds of soybean oil is obtained, Dr. Passino said.

Oil Previously Lost

Previously all vitamin E in the country's annual yield of 1,200,000,000 pounds of soybean oil has been lost.

(Note: Vitamin E has wide theraputic value, particularly in the field of bostetrics, and is given to prevent miscarriages).

"The new process not only salvages vital vitamins but saves sterols, essential in the synthesis of hormones," Passino pointed out.

It also will contribute immense savings and higher quality concentrate in vitamins A and D.

"We prepared a concentrate of vitamins A and D from shark oil recently and sent it to a New York hospital for evaluation. The tests were so remarkable the hospital asked for nine billion units immediately. We didn't have it, of course; we were in an experimental stage," Dr. Passino declared.

Scope of Savings

The scope of savings by the new non-chemical process is illustrated by this fact: In 1944 California produced 17 million gallons of sardine oil. The solexol method would have saved $3,500,000 in vitamins, leaving 12 million gallons of high grade, quick drying oils for paints.

Every 100 gallons of menhaden (Atlantic sardine) oil processed with propane will yield 35 gallons of drying oil and 53 gallons of other oil equal to costly linseed oil, not counting vitamin concentrates, fats for soaps, and other materials of theraputic value.

Under the old system by which soybean oil is broken by chemicals, these strictly steps are necessary:

1. The oil must be washed free of lecithin and filtered at a loss in oil of about one per cent.

Freed of Fatty Acids

2. The residual oil then is freed of fatty acids and rewashed, at a loss of about four per cent.

3. Next it is bleached with clay to decolorize it, at 1-2 per cent loss.

4. Deodorized by steam under a vacuum.

Dr. Passino said the new propane process handles the first three steps in a single operation lasting less than an hour.

In vegetable oils he said the process achieved total elimination of soap, an elimination essential for edible oils.

A breakdown in losses through processing by the oil alkali system and by the new solexol method showed these results:

Soybean oil—Old style process 4 to 6 per cent loss. New process two to 2 1-2 per cent loss.

4 to 8 Per Cent Loss

Cottonseed oil—Four to eight per cent loss compared to two to 2 1-2 per cent loss.

Corn oil—Three to five per cent as against 1 1-2 to two per cent loss.

"One cottenseed oil plant is now saving $4,000 daily through redeemed edible oil that formerly went into soap," Passino said.

Oils are being extracted not only from fish liver but from the body of the fish, he declared, thus widening the field for vitamin recovery.

A. M. W. Kellogg & Co., spokesman said a number of new plants were being construeted abroad and that five large plants are being built in the United States to use the new process. Names of companies ordering the new plants were not disclosed.

"Benny," said his mother, (helping him with his home work), "tell me how many is seven and four." "Twelve," replied Benny. "Not bad for a little shaver," volunteered papa. "He only missed it by two."

4-H Boy Makes Projects Pay

Five years ago O'Neal Wilhite, a 10-year old boy in the Kimo Community, Lawrence County, started out to do a job of 4-H club work. He wanted to become a good farmer and his father decided to give him a chance to do a good job.

O'Neal's first projects were a small patch of corn and a pig that he bought from his father. He paid for the pig with money he received from doing small jobs. This gilt brought a litter of pigs and feed for them was furnished from his corn project and from permanent pasture. When his hogs were sold, O'Neal used the money to start a cotton project.

He started with one-half acre of cotton from which he harvested one-half bale. He also grew corn, poultry and hogs. During the third year he planted and cultivated two acres of cotton and raised one sow and three calves. From these projects his income had reached the point that everybody in his community could see that 4-H club work was the ideal thing for boys and girls in every community.

Today, at the age of 15, O'Neal is almost as good a farmer as his father, who is a result demonstrator, in the Kimo Community. O'Neal is feeding a Hereford calf which he bought with money from other projects. He grew most of his calf's feed at home. He is also proud of his other livestock—one horse, three hogs, fifty chickens and six head of cattle.

Plentiful Foods

Potatoes will continue to be plentiful on markets throughout the country generally next month, marketing specialists of the U. S. Department of Agriculture announce. Also plentiful will be citrus fruits—oranges, and grapefruit, as well as canned grapefruit segments and canned citrus juices— orange, grapefruit, and blended juices. On the abundant list also are dried peaches and dried small-size prunes, eggs, peanut butter, and heavy tom turkeys.

The Dollar Has Changed

The farmer's best buy for a dollar today is payment on a debt, say A P I extension economists. Back in 1932 it took 303 bushels of corn to pay off $100 in debts. From 1935 to 1939 it took 145 bushels to pay that amount. In July, 1946, it took 52 bushels of corn to pay $100 in debts.

Morgan Women Study Clothing

In November the home demonstration agent taught adult and junior club members of Morgan County how to select and buy underwear. An exhibit of slips was used for the demonstration. Slips of different materials, styles and sizes were shown in each community.

Each garment was studied as to the way it was made, how long it would last, the quality of the material used, how suitable it is and its cost. Each slip was carefully examined by club members.

Farmers Get More Than After War 1

Farmers are now getting more actual cash from a family market basket of farm food products than they did back in 1920, at the peak of the post World War 1 inflation. Farmers' share of consumers' food dollar in February, 1946, was 55 cents, contrasted with 43 cents in 1920 and 53 cents a year ago.

More Fruit Trees Are Needed in State

New plantings of fruit trees and plants are needed to increase the home supply of fruit throughout the State. Alabama farmers can produce a large part of their fruit supply which will mean a saving in the family budget, says W. A. Ruffin, API extension horticulturist.

Burley Marts In Tennessee Overloaded

By Roy H. Milton

(UT Extension Tobacco Specialist)

Today the burley tobacco markets open over the nation; today there is the worst glut on the markets of Tennessee that the state has ever seen.

In talking with a friend from Knoxville last Wednesday he asked "Have you been around the loose leaf floors in Knoxville this week?"

I answered, "No, why?"

"You never saw such a sight in your life. Trucks, autos and wagons are lined up for a mile waiting to get unloaded. It looks like some growers will have to sit in that line until Christmas. The question in my mind is, 'When can they get unloaded?" Think of the misery of waiting."

My friend, not being any too familiar with the marketing of burley, then invited, "Why all this rush anyhow? Why are all the growers trying to get their tobacco onto the opening sale? I don't understand."

Any man who is in a position to turn back the pages of tobacco marketing history—particularly the pages of one year ago—knows the answer. At that time, we saw the market open up with a bang. Burley had never made such a high average. Buyers on all markets could be seen running over the auctioneer, yelling and squalling and tearing their hair, trying to get at the ceiling . price the baskets of golden weed, lined up ahead of them. Then suddenly, to the astonishment of the world, it was whispered about that the farmers had grown too much burley. Immediately, down, down, down went the price like a kite caught in a downward air current. Many brades, after a hot two weeks' selling period, went below the floor price, and had to be taken over by the Tennessee Burley Growers Association, at that time still in its infancy.

Now, a friend down in Lawrence County, near the Alabama state line, asks, "What do you mean by the floor? Please explain. We haven't heard anything about floors during the past few years. It has been ceilings, ceilings and ceilings. I attended the opening sale at Mt. Pleasant last year and overheard a buyer talking to a group of farmers. Here are the buyers exact words, "Men, if the government would only take the damn ceiling off this tobacco, you'd see prices soar higher than you ever saw them. We need tobacco.' Two weeks came and went; then . . . I read what happened. Now growers everywhere are talking about a floor, a floor. We must have a floor. Please explain it."

Today, in Tennessee there is being perfected a tobacco marketing organization known as the Burley Tobacco Marketing Association. It is being sponsored by the Tennessee State Farm Bureau. This association is or will be farmer-owned and farmer-controlled. It is being manager by H. S. Duncan, a native of Trousdale County and a 12 man board of directors. This association has gone onto the money market—the Bank of Co-operatives —— and it has obtained money with which to buy and pay for member growers' tobacco at the time of delivery. Payment will be made by the warehousemen, who will later be refunded by the association.

"But," says my friend, "you have not answered my question, 'what is the floor'?"

After reviewing stocks of burley in storage houses and getting a careful estimate of that grown in 1946, a group of experienced tobacco men, appointed by the Burley Association and the USDA Office of Production and Marketing, assembled and reviewed the burley situation and possible trend; then they placed a market value on each grade — a price at which they thought the grade could eventually be sold.

The Association grade price, reprents the floor. It is the floor.

Today, the slump, of December, 1945, stares every grower in the face, Naturally he is expecting history to repeat itself. This fall has been warm; rains have fallen, and stripping seasons have come with them. In fact, burley has been in stripping condition almost every morning this fall. So farmers have neglected other farm duties and have stripped tobacco. Now, it is being rushed to market in a manner unheard of before. All markets are glutted.

Today and tomorrow, your tobacco specialist is longing to see all grades of tobacco have the same market value on March 31 as they have on, say, December 7. The price of a package of cigarets does not flustrate in that period of time. To me, there is no legitimate excuse for much fluctuation during a season. Tobacco should be a fitin, farm management crop. The grower should have all winter in which to strip and market his crop. And when a plan is perfected for holding the price through December, January, February and March, gluts, as we have them today will have been overcome. The Burley Market Association can, they must and they will have a voice in marketing their products.

Outta' Soap? Well— Make Your Own

We don't have any either, but there's a way to get some. Make your own.

The public library of Cincinnati, running short of books pertaining to soap making, has issued a mimeographed recipe to customers on how to "roll their own."

The equipment: two enameled pans (one two-quart and one six-quart). One wooden spoon or paddle. One pint measure. A thermometer. A measuring cup. Shallow pasteboard boxes for molds lined with waxed paper. The ingredients: six pounds fat, two and one-half pints cold water and one can high-test lye.

The temperatures are important! Follow this chart:

Kind of Fat	Temp. of fat	Temp. of lye solution
Sweet lard or others soft fat	80-85	70-75
Lard and tallow (half and half	100-110	80-85
All tallow	120-130	90-95
Soft rancid fat	97-100	70-80

Melt fat to a clear liquid and allow to cool to proper temperature. Add lye to the water and stir and bring to proper temperature. Pour the lye solution in a thin stream into fat while stirring steadily in one direction. Continue for 10 or 20 minutes until spoon leaves a decided track in mixture. Then it is ready to pour.

If you like a floating soap, gently fold in air before it sets.

When soap is thick, pour into molds and cover to retain heat. Allow to set for 24 to 48 hours until it has hardened. Cut into small bars with a heavy string or fine wire and stack in log cabin fashion to allow complete hardening.

AN ASSET TO THE TOWN

We take the American merchandising system for granted—as we do most of the institutions that serve this country. And so we tend to lose sight of the fact that no other nation has a system of distribution remotely comparable to it.

In normal times, we expect the merchant to offer an extremely wide selection of goods of known quality at reasonable prices—and that is precisely what he does. In abnormal times, we expect him to redouble his efforts to give us what we want in the face of shortages, and to equitably distribute scarce items among his customers —and he does that too. At all times, we expect him to take an aggressive interest in the affairs of the community—and that expectation is fully realized.

This is true of all kinds of merchants—the independent, the manager for chain the dealer in low-priced goods, the dealer in luxury items, and the rest. They compete vigorously among each other for our trade—and they hold in common the same general principles of service to the public and to the community in which they live and work.

A hungry cow is never profitable. Give her plenty of good feed.

THE FORUM

The Modern Farmer

Published monthly by the Modern Farmer at Nashville 3, Tennessee.
Giles A. Hubert,---------- Contributing Editor
Sadie Wilson ---------- Secretary
Henry Allen Boyd.---- Publisher
Office, 403 Charlotte Avenue.

Devoted to the interests of the Farmer, Truck Gardner, Livestock and Poultry, Breeder, the Home and the People.

Entered as Second Class Matter, April 10, 1929, at the Post Office at Nashville, Tenn., under act of March 3, 1879.

All contributions for publication in the Modern Farmer, should be addressed to The Modern Farmer, 403 Charlotte Avenue, Nashville 3, Tenn.

No libelous matter will be published. Unsigned articles or letters, and those written on both sides of the paper will not be used.

Subscription price $1.00 per year, 75c for six months, payable in advance. Personal checks must be certified. Make all checks or money orders payable to The Modern Farmer.

Advertising rates and sworn circulation figures presented upon application.

Demonstration Clubs Make Useful Gifts

Homemakers of Madison County Demonstration Clubs made and exchanged beautiful and useful gifts in December.

At the club meetings in November members talked about many serviceable gifts that could be made from inexpensive materials around the house. Plans were made for the exchange of gifts and most of the clubs decided to give a club party.

At each party there was a Christmas tree loaded with gifts. Carols were sung and interesting quiet games were played. Prizes were given to the winner of each game. Then the tree was unloaded.

As packages were unwrapped, members found cup towels, pillow cases, pot holders, table runners, guest towels and rugs made from feed sacks; salt and pepper shakers made from peanut butter glasses and mayonnaise jars with serving trays to match from old lard can tops which had pretty designs painted on them; fruit bowls made from phonograph records; and painted vases made from mayonnaise and pickle jars. Canned fruit, vegetables and jam wrapped in Christmas paper were also given along with some pies, cakes, sauce pans, double boilers and roasters.

Refreshments closed the final chapter of each holiday party. Members, guests and home agents at each gathering were served a tasty repast.

Hens Are Producing More Eggs Now

Hens are laying more eggs now than they did a few years ago, according to John Ivey, API extension poultryman.

Twelve years ago the average per hen was 96 eggs a year; in 1944 the average was 118. During 1945 layers fell back a couple of eggs. but Ivey expects American hens to reach even a higher rate of laying in the years ahead.

Reasons include (1) shift from farm hatching to commercial hatching; (2) the National Poultry Improvement Plan; and (3) a trend toward all-pullet flocks.

Liberty County's H. D. Council Plans Fashion Parade

McIntosh, Ga., Apr. 11, 1947.—Highlighting the Spring season was the Home Demonstration Council's Spring Fashion Show that took place on April 25, at 8:30 o'clock p. m., at the Colored USO building in Hinesville, Georgia.

Such event is designed to be very educational as well as interesting to all family members. It is aiming to suggest many new ideas for each homemaker to aid her in planning the family's clothing budget, and saving the family's income by making any needed new garments and remodeling or renovating the old garments.

This colorful event will feature the officers of the H. D. Council, officers of the community clubs, and several active club members as the models. The council officers are as follows: Mrs. L. R. Frasier, president; Mrs. Maggie Williams, vice president; Mrs. Sylvania Smith, secretary; Mrs. Ida C. Williams, treasurer; Mrs. C. Mullice, historian; Mrs. Clarence Holmes, reporter; Miss Mildred A. Turner, Jeanes Supervisor.

Other interesting features of the program will include:

1. A Clothing Exhibit showing the work done by the high school home economics girls under the guidance of Mrs. Josie Scott.

2. A Health Exhibit showing the work done in the food classes by the home economics girls under the guidance of Mrs. Pansy Brown.

Two very good movie films will be shown of interest to all children and adults, by Mr. C. L. Rawls, High School Principal.

"IF YOU WANT TO SEE AND BE SEEN YOU MUST BE ON TIME" Says Mattie Mathis, Home Demonstration Agent.

MATTIE MATHIS.

Lawrence County Homemaker Grows An All-Year Garden

"The great need for food for our people and people of other countries makes a garden absolutely necessary, especially when many people are starving," says Mrs. Alice Warren, homemaker of Moulton Community. Lawrence County.

Since canned fruits and vegetables are scarce, it is very important that the homemakers of Lawrence County, who have small plots of land make an all-out effort produce enough food, she adds.

Mrs. Warren started planting her fall and winter garden last August She still has carrots, lettuce, onions collards cabbage, turnips, mustards, beets and Irish potatoes. She has enough vegetables in her garden now to last her family the rest of the winter. Mrs. Warren canned some of the vegetables from her garden for use later in the year.

Perry County Club Boy Has Two Good Projects

James Harris Anderson. Perryville Community, Perry County, carried two projects for the year 1946. He had one acre of corn and one acre of cotton.

This 4-H'er has been a club boy for three years and has done a very successful job throughout the entire time. He did most of the work on his projects this year and helped his grandfather farm.

From his cotton James received $65 after paying the expenses of land rent, seed and fertilizer. He produced around 30 bushels of corn which he is using for food and feed. He is going to the city school this year, but says that he will stick to some type of project to keep a cash income.

Economic Highlights

Happenings that Affect the Dinner Pails, Dividend Checks and Tax Bills of Every Individual National and International Problems Inseparable from Local Welfare

One of the remarkable anomalies of the time is that while most business is operating at extremely high production levels, a great many industrial leaders are seriously worried about the not-so-distant future. They see pitfalls ahead. This attitude is the result of the obvious fact that a great many consumers—and especially those in the middle-income brackets who used to absorb most of the output of our smoking factories—are being priced out of the market.

The signs are growing plainer for anyone who takes the trouble to look. That ol' debbil, high prices, is a dark cloud on the economic horizon. In some strictly luxury fields, such as the night club business, conditions are worsening fast. Many a club has been forced to rid itself of expensive floor shows and to engage cheaper bands. Liquor sales have declined. Sales of costly fur coats, jewelry and cosmetics have fallen sharply. The great war time spree, when you could sell practically anything at any price, is but a diminishing shadow of its former lusty self.

The price cloud likewise hangs over basic lines of goods—the kind of goods whose mass production keeps the American economy in motion. The most obvious example here is automobiles. Dealers everywhere report cancellations of orders as disappointed people take a look at the price tags. Some motor manufacturers have frankly forecast that by the end of the year salesmen will be out looking for purchasers. This more cautious attitude on the part of the consumers is reflected in many fields, and one result of it is that large retail buyers are placing their orders with great care.

What it all adds up to is that millions of people now have more money—but less buying power. Prices and living costs have outrun increases in salaries and income. An article in a recent issue of the New Republic, by Bernard Posner, entitled "What'll We Use for Dough?" deals vividly with this sad fact. Mr. Posner, describes himself as a typical $5,000-a-year man with a wife and baby. Families in this income bracket—which is, of course, well above the average—are supposed to be steady and dependable buyers of new cars, expensive radio-phonograph combinations, fine clothes, super-de-luxe kitchen equipment, and so forth. Mr. Posner's article goes into complete detail as to what happens to his money. Out of his $416.67 monthly paycheck, $48.67 is retained for withholding taxes. Rent takes $65, and food about $95. An ancient car costs $25 to operate at best, and laundry, cleaning and diaper service run to $22. Clothes call for $20, and such things as insurance, telephone, and monthly Savings Bond total around $40. Recreation and charity cost $25, and $5 is spent for newspapers and other reading matter. His lunches consume $20, and house-cleaning equipment, bathroom necessities, furniture, and odds and ends demand close to $30 more. So it goes, with the money budgeted carefully, until at the end of the month nothing is left. These costs are typical of a vast number of families in and about the $5,000 income level. Nothing remains for that shiny new car or that amazing refrigerator with the built-in deep-freeze unit.

If the $5000-a-year family is in this position, what about those with substantially lesser incomes? A survey made by the National Housing Agency last summer contained a section on the earnings of war veterans. It found that only 4 out of each 100 made $80 a week or more. The average weekly income of married vets was $49. These incomes may be somewhat higher now, but they are still far below the level that will permit buying on the scale needed to keep the industrial machine functioning once the shortages are made up.

It is hard to find a reputable economist who believes that more and more wage increases are the real answer to the cost of living problem. The reason for that is that significant wage increases are almost inevitably followed by price increases which more than offset the gains. Industry, obviously, can meet its bills only by pricing its wares in accordance with operating costs. This wage-price spiral, if allowed to go on unchecked, always winds up with unbridled inflation of the kind that plagues Europe and China. Money can be measured only in terms of what it will buy. And inflation always hits hardest the white-collar class which has been the backbone of the economy.

Tax reduction will help, but not as much as some people seem to think. For instance, if the new tax bill, in the form approved by the House, becomes law, a four-member family with $25000 net income would save only 50 cents a week—and the same family at $5000 net level would save only $2.00 a week. These savings would hardly permit "luxurious" living.

A good many experts are convinced that prices are due to come down—but there is much disagreement as to just how far down they can possibly go. Consumer resistance is a factor in this, but the fact remains that no one can long sell goods without a profit. And some very convincing surveys have been made which indicate that business, by and large, is pricing products about as low as today's running costs will permit.

The prophets are being extremely cautious in predicting what will happen. But most of them feel sure that there are difficulties ahead.

Hale County Farmers Plant Blue Lupine

Thirty acres of blue lupine was planted by Hale County farmers last fall. This was the first time that this legume has been planted by Negro farmers of the county.

The 30 acres are set up in 15 result demonstrations of two acres each. The demonstrators followed recommended practices in fertilizing, preparing soil and seeding. All demonstrators succeeded in getting a stand good enough to make a satisfactory cover.

The demonstration showing the most growth is that of Nebris Burroughs, Baysprings Community. The plants average twelve inches in height and completely cover the ground. This gives a promising outlook for restoring the nitrogen in the soil when it is turned under next spring.

This new legume is being observed by a number of farmers in each community. With the success of the demonstrations now in process, more acres of blue lupine will be seeded by farmers next fall.

Water Control Work Increases

Water control work carried out by Alabama farmers last year will pay off in higher crop production and increased value of land.

More acres were terraced and drained and more farm ponds were built than in 1945, states J. B. Wilson, API extension agricultural engineer. Comparative figures for the two years are (1946 given first): acres terraced, 620,000 and 278,000; acres drained, 52,818 and 46,000; number of farm ponds, 951 and 424.

Veteran Farmer Retires From Morgan County Farm

J. C. Sharpley, veteran farmer, Danville Community, Morgan County, retired from active farming at the end of last year's harvest. He is 70 years old and is unable to carry on the farm business due to partial blindness.

From the beginning of extension work in the county, J. C. Sharpley has been an active cooperator and demonstrator. He has served both as community and county president of farm clubs. He was the first to plant, develop, and keep an orchard for marketing fruit; the first to win and operate a lamp brooder; and the first to grow lespedeza sericea in Morgan County.

About 30 years ago, Mr. Sharpley bought the 51-acre farm on which he now lives. At that time the land would not yield more than 150 pounds of lint cotton per acre. Some years ago, he began a soil building program by using summer and winter legumes, compost, manure and by terracing his land. For the last ten years he has produced more than 500 pounds of lint cotton per acre.

Sanford H. Lee, Agriculturist

Graduate of Tuskegee Institute County Agent, Georgia Agricultural Extension Service

The worn-out soil around Sugar Hill in Georgia was yielding less cotton each year. Fat meat was getting scarcer. Poverty gripped the community, and no new idea had penetrated it since the Civil War.

When Sanford Lee, the new County Agent, fresh from Tuskegee and full of book learning, arrived there nearly thirty years ago, he was regarded with suspicion. When he asked for an opportunity to come to church on a Sunday morning and preach his gospel of less cotton, more feedstuffs and better livestock, he was deemed a dangerous heretic by pastor and flock alike.

Young Lee persisted, however, first gaining the confidence of his white nieghbors. Gradually he got the Negro farmers to plant wheat, soy beans and velvet beans. He encouraged them to enrich their depleted soil with winter peas. He showed them how to plant tall bush clover, which provides excellent grazing throughout the spring and later can be cut three times for hay.

As time went on, Mr. Lee introduced pedigreed hogs. The blood of these Poland Chinas has built up the droves of five counties. In recent years, Mr. Lee's proteges have been raising grand champion Hereford steers which are graded "U. S. Choice" and regularly take top prizes at fairs and cattle shows.

Today Sugar Hill is a progressive agricultural community. Sanford Lee's patient efforts have brought ambition, prosperity and better living to hundreds of people, both Negro and white. Truly he is a Negro college graduate who **teaches hope to all.**

Cotton Crop Losses Are Now Being Paid

Alabama farmers, at the rate of about 100 daily, are getting checks to cover their 1946 cotton crop loss claims, State officials of the Federal Crop Insurance Corporation announced this week.

Of the 13,000 Alabama farmers who carried cotton crop insurance last year, 7,000 have filed claims for losses. These claims are being handled as rapidly as possible and farmers will be informed of action taken by FCIC, officials stated.

The Action Program of the President's Famine Emergency Committee

Chester C. Davis

Chairman of the Famine Emergency Committee

The greatest concern of the Famine Emergency Committee at this time is . . . to make sure that enough food is produced and saved to meet our goals for foreign relief and to exceed them if possible. In our efforts to save people from starvation in other parts of the world, we do not wish to invite the danger of widespread hunger in this country next winter. Considering the food outlook in general terms it is not likely that we shall fare any worse in the year ahead than we have fared in the last two or three years.

But there will be some shortages. Besides the shortage of wheat there will be a shortage of fats and oils . . . There may be shortages of canned foods next fall and winter . . . And as long as consumer demand continues to take about everything the market offers, it is possible that other shortages may develop . . .

Gardens Protect Against Shortage

This year we shall need millions of gardens—millions of backyard food producers. Gardens in 1946 will help us conserve wheat by giving our families extra vegetables to make up for less bread and cereal . . . Potatoes, for example, can substitute for bread in many ways. Gardens will provide a cushion against shortages which may develop here and there in the critical months. Gardens will enable many more people to can and preserve foods, making it possible for them to donate more to collection campaigns for foreign relief. **Gardens, in short, will help us meet our goals for export and protect us against shortages at home . . .**

You may be interested in knowing that gardens all over the world will be grown with American seed this year. For every eight pounds of vegetable seed we plant, one pound is sent abroad. All told, the United States will ship about 30 million pounds of vegetable seeds to 37 different nations this year. On an average, a pound of seed abroad will produce about a thousand pounds of food . . .

We are assured, by reports reaching us from all over the world, that the people of the famine-stricken areas are doing everything in their power to get back into full-scale production. . . In Europe, farmers are partially overcoming the serious shortage of draft power and equipment by pooling and sharing and by using hand implements. City workers are helping on farms and taking their pay in food. All over Europe, collective gardens are in operation.

The More Gardens We Have—The More Lives We Can Save

I want you to see the National Garden Program this year as I see it, in relation to the general campaign against famine that is being fought on many fronts. Our pressing need is to get sufficient quantities of food into the regions of the world where it is needed to save lives—and to get it there in time. In order to do this we must first assure that there are ample supplies of such foods available for export. To assure these supplies we are taking drastic steps to conserve what we have on hand and to produce more in the months just ahead. Victory gardens will make it possible to conserve more food and to produce more food in 1947. The **more gardens we have and the better gardens they are, the more food we can send abroad—the more lives we can save.**

Corn Demonstrators Report High Yields

Yields of 40 to 100 bushels an acre are being reported to county agents by the 400 farmers who cooperated closely with the extension service in carrying out high fertilizer rate demonstrations with hybrid corn. These farmers followed their county agent's recommendations on varieties, planting dates, fertilizing, spacing and cultivating.

Your Home—And Its Horizon

Malcolm H. Dill

Chief, Planning and Design Cincinnati Planning Commission

A long-term treatment seems appropriate to a garden program because gardens cannot always be dealt with on an emergency basis as they have in the past.

Bombing Did Not Stop Town Planning in Great Britain

The fact that British town planners and city planners had gone ahead with their plans for the future while bombs were dropping all around them seems worthy of note. The wisdom of that procedure is now being exemplified in practical plans in such places as Plymouth, Coventry, and the city and country of London. They are now **ready to carry out their plans** without waiting until the emergency job is over.

As a single individual can mould the character of his own home, acting collectively those individuals can help to **determine the character of the whole community.** The way in which the land is used and distributed for residence, for industry, for central business and local shopping, for recreation, kinds and locations of routes for transportation on the ground, in the air, or on the water, **are the concern of city and town planning.**

Inspiration for City Planning

City planning had its inspiration in the Chicago World's Fair in 1893. The beauty and impressiveness of its buildings and grounds were in such contrast with prevalent urban surroundings of that period that most of the spectators looked on the imposing architecture as being the really significant aspect. The important thing seemed to be to beautify a town by covering up the ugly spots instead of designing a building or a portion of a city to fit its function. We are now entering an architectural era wherein everything is honestly designed to fit its particular purpose.

Inadequate Space and Haphazard Growth Should Not Be Permitted

In the past, most cities have just **kept on expanding without much guidance or control.** We became used to having people go out in the country close to a city or town and add a new street, selling lots of 50 feet or whatever they could get away with. The point will soon be reached where a definite, practical limit will be set for the expansion of cities and small towns. **From an economic standpoint,** haphazard growth of that kind **cannot be permitted.**

The big city has lost touch with its citizens, and vice versa. It has forfeited many of the advantages offered by smaller towns. Current planning is trying to correct that deficiency. Planners are seeking answers to questions of where are and where should be the general locations of places for living and working, for shopping, and for playing? The divisions of larger areas into natural communities into several neighborhoods is being recognized. Each is residential in character but each has its large community shopping center. Each community has its junior or senior high school, each neighborhood, its elementary school, which whenever possible is logically the center of educational, cultural and recreational activities. More and more boards of education are recognizing that education does not stop when school is let out for the day and that recreation, whether for the adult or for the child of any school age, is just as much a part of education as any other function of the school system. Many people are of the opinion that the school is the appropriate place for community gardening, providing a particular kind of recreation. Playfields and playgrounds are located in relation to the community and neighborhood pattern.

Buffer Areas Between Industry and Residential Neighborhoods

From the standpoint of convenience for public access and because of the **opportunity of sharing a mutual setting,** such community buildings as branch libraries, health centers, branch post offices, police and fire stations should be **arranged in groups** wherever possible. While there is no connection between a fire station and a branch library, such a grouping is in keeping with our tradition. We have got too far away from the **New England town common idea or town square.**

Separate belts should help to demarcate one community from another. In these separator belts should be located the major areas of production and distribution usually located along railroads, and also the main highway trunk lines. Institutions, cemeteries, golf courses, unusable steep hillsides and valleys should also be in those belts. The purpose of those separator belts is to serve as **buffers or transition areas** between industry and trunkline traffic and residential neighborhoods.

Good Planning May Restore Many Advantages Cities Have Lost

Direction of growth or redevelopment of cities in accordance with a community and neighborhood pattern should help to **gain many of the advantages of a smaller town** that most cities have lost. At the same time, these larger aggregations of communities will present opportunities for cultural, recreational, and medical advantages that can't be furnished by isolated smaller cities.

There are several specific ways in which an individual can promote this kind of local and broader environment for his home.

1. He can **join or help to organize a neighborhood council** or civic association. An important thing to avoid in such organizations is any tendency to let it become merely a pressure group for local improvements.

2. He can work through such a neighborhood organization or a school Parent-Teacher Association to **develop a well-rounded program** of neighborhood social and recreational activities.

3. Through such groups he can promote, if not already existent, **formation of a city or metropolitan planning commission.** The job of such an official agency is to fit together all the numerous elements involved in planning a city and its surroundings—from the broad scale treatment of a Master Plan, down to details of neighborhood planning, such as seeing to it that **individual lots will be big enough to permit having your own garden;** or if you live in apartments, that provision is made for joint garden areas.

Larger Lots in Future Subdivisions Are Desirable

More should be said about having **larger lots in future subdivisions,** both from the standpoint of desirability and from the standpoint of the type of community that should exist in the future. We should all plan to live underground because of the prospects of the atomic age. I feel a little bit as General Eisenhower had expressed himself in a recent movie short. When asked whether he thought we were approaching a third world war, he said, "No. If I did I would have jumped off the plane on the way across the ocean." It seems rather pointless to talk about building cities underground. Whether there is anything inherent in the atomic age from the standpoint of the advantages it can bring, as regards community planning, it is quite conceivable that the air transportation may have an advantage in **larger lots,** although I am not at all sure that every family will have a helicopter and a place for it to land. Since there is **so much room for expansion around our cities and towns,** we might just as well use as much as we would like to have. In saying that, I am not overlooking the economic angles and the money it costs to put in utilities and streets.

4. He can join or help to organize a **city-wide citizens' planning group,** to encourage and assist the official planning commission and to help to see that its **plans are carried into effect** in accordance with a well thought-out financial program for public improvements.

Cities and Towns Must Grow Better and Not Merely Bigger

For the greatest good for the greatest number, plans to **promote the best and most livable types** of new neighborhoods must continue to be made; existing good neighhoods must be protected so they will stay good; ways of renovating and modernizing neighborhoods that are on the verge of deteriorating must be found. and finally neighborhoods that are beyond hope of redemption in their present blighted form must be replanned and redeveloped by the use of proper legal tools.

The Future Belong to City that Plans for It.

The time is past for expecting most cities and towns to go on growing bigger, as far as population is concerned. **The time has come for them to grow better.** It requires a vast amount of the same kind of applied civic spirit that was so magnificently exemplified in war time. Whether it can be done without the inspiration of patriotic stimuli will be the **acid test for true citizenship.**

In conclusion I quote an eminent citizen of Cincinnati, one of America's great exponents of intelligent and far-sighted city planning, the late Alfred Bettman, who said, **"The future belongs to the city that plans for it."**

Benefits for the Coal Miners

Only a strong and competently managed industry can meet the demands of the worker for a higher standard of living. The soft coal industry, despite the difficulties it has had with an irresponsible union and an often-vacillating government policy, is an excellent case in point.

No one can deny that miners' present earnings—the highest, by a substantial margin, in any mass industry—came in large part from union aggressiveness. But it should not be forgotten that only a progressive industry could have paid the bills and remained in business.

The industry itself has been almost solely responsible for many improvements in working conditions. As an example, 50 per cent of all bituminous coal mined underground is mechanically loaded, and more than 90 per cent is mechanically cut— thus largely eliminating the back-breaking pick and shovel.

Occasional terrible disasters, such as that which recently occurred in an Eastern mine, should not blind the country to the very real achievements that the industry, aided by the fine work of the U. S. Bureau of Mines, has made in advancing safety. Mining coal is obviously a hazardous operation. But between 1924 and 1946 fatalities per million tons mined declined 62 per cent—almost two thirds.

Home ownership is one barometer of living standards. Today about two-thirds over 260,000—of the nations's soft coal miners either own their homes or rent from private landlords. Only one-third live in company-owned houses. The old time "company town" is dying and the industry is helping speed its demise.

The American coal miner makes more money and lives better than ever before—while the standard of living of his counterpart in other countries has generally declined. It does no disservice to the work of the unions and other agencies to point out that high-calibre mine owners and managers were largely responsible for these great gains.

Farm Income Vital to U. S., Brehm Says

If the farmers' purchasing power shrinks, the entire economy of the country will be affected, C. E. Brehm, acting president of University of Tennessee, told Exchange Club members yesterday.

"The fellow who produces isn't getting a fair share of the consumer's dollar and this is very important to a rural state like Tennessee," he added.

Sixty-five per cent of the business and economical structure of this nation depends on the farm. Brehm pointed out, and its entire social, economic, and religious structure depends on distribution of its food supply.

"The man who has three square meals a day is on the up and up but when he is hungry he becomes dangerous," according to the university president.

That is what is confronting the United States today in her dealings with Europe, he said. We are depending on shipments of food to help counteract the philosophy of the people in occupied countries.

"Here in Tennessee, the farmer gets only one half of the dollar you spend for food and if his purchasing power drys up, it is a danger signal." Brehm warned.

The Stream of Commerce

Most of us at some time have had occasion to pause for a night at an auto court or hotel a stone's throw from one of the nation's main arteries of transportation. For those who are not sound sleepers it is a soul-shaking experience. Hour after hour deisel vans and tankers roar through the night in endless procession. The interminable hum of heavy tires is broken by the occasional explosive hiss of an air-brake. During a momentary lull the would-be sleeper becomes conscious of a heavier rumble, seemingly from miles away. At first it is hard to identify, then the windows begin to rattle and a locomotive's screaming whistle splits the night. The sound of the highway is drowned by the tumult of a long fast freight. This incredible travel by rail and road continues every hour of every day, year in and year out. Let the stream be interrupted and hardship would strike the nation with terrifying suddenness. Food, clothing, medicine, machinery, all the necessities and luxuries would magically disappear from store counters.

Speaking of store counters, the wonder of the American distribution system does not stop with the mysteriously fascinating roar of trucks and trains in the night. Think of the tens of thousands of retail merchants who are responsible for keeping the stream in motion. They must have what people want, when and where it is needed, whether it be a needle or a tractor. They try hard to fill this need because their business life depends on keeping the goods moving at prices you and I can pay. It is no secret that many of them, in fact, most of them, operate on such narrow margins of unit profit that almost unbelievable sales volume must be maintained. A physical impression of that volume flowing to the far corners of the land can be gained by watching for a moment the great freight movement over a main transport route.

It is actually the minimum price merchandising philosophy of the modern retailer that keeps the freight rolling and makes possible the legendary American standard of living.

Free Enterprise At Its Best

Government statistics on the cost of electricity in relation to the cost of all commodities constitute one of the best answers to those who think that the power industry has fallen down on the job. In March, 1937, electricity stood at 99.6 on the index and "all items" were at 101.9 (100 equals the 1935-39 average). Since then, electricity has continually gone down—while other prices have continually risen, except for very brief downward flurries. Last December electricity was at an all-time low of 88.9—while "all items" were computed at 153.9.

The electric industry has been subjected to all the rising costs of the time—wages, taxes, materials and supplies, etc. Only a miraculous efficiency, combined with a great increase in consumption, has enabled it to reduce the cost to the consumer.

On top of that, the industry's development and expansion program is going ahead at accelerated speed. Special emphasis is now being placed on extending rural power lines to where they may be reached by practically every American farm. This, it is estimated, will cost about $300,000,000. It will be completed by the end of next year if sufficient materials are available. And electric industry spokesmen say that the drive will be consummated whether or not governmental agencies, such as the REA, remain in existence.

The American electric industry is a national asset of which the country may be proud. It represents free enterprise at its best.

Pig Care

Care given the sow just before and just after farrowing plays an important part in determining the percentage of pigs that will be raised to weaning age, advises W. H. Gregory, API extension livestock specialist.

Farm Talk, With Farm Folk

By Jesse Safley

April 1 was the day to which many have looked forward for a number of weeks—not because it was "April Fool's Day," but because on that date another sugar stamp became valid. This particular stamp was cherished because it allowed the holder to purchase twice as much sugar as previous coupons.

We wonder if we are gaining as much as we are led to believe. Five extra pounds of sugar at this time of year means a great deal to almost everyone because there is no canning to be done and that amount of sweetness might be used for pies, cakes, and other forms of dessert. The trouble will come later, however, when there is fruit to can, preserves to make, and there is no sugar available. The extra five pounds you buy tomorrow, or whenever you use that new stamp, is taking the place of the canning sugar you have gotten in previous years.

The information we have obtained on the sugar subject is that there will be no special canning sugar this year. The extra poundage permitted on the stamp becomes valid tomorrow—and another later in the year—will replace what has been known in the past as "canning sugar."

It's true there is a bill in Congress now that if made law would allow 35 pounds of sugar per person for the year. But it is only a proposal and may never become law. The wise thing for anyone to do is to go slow on the present supply and not be caught short ("out"—we should say) when canning time comes.

There have been many things we don't understand about sugar rationing. Last year during strawberry season we visited a number of quick freeze plants were berries were being processed. There was no shortage of sugar when it came to processing because the plants bought and processed all berries delivered to them. But the grower could not get enough sugar to preserve a few pounds for home use—yet since the close of the season frozen berries, "sweet enough to serve" have been available in the larger grocery stores. The farmer could buy back his berries with sugar added at three to four times the price for which he sold them.

Today in almost any section of Nashville frozen sweetened strawberries may be purchased. As the situation shows up, now farmers will experience the same conditions when they are ready to preserve fruit again this year.

If there is still a shortage of sugar, as we are led to believe, how will a bill approved by Congress increase that amount? Our opinion is that there are those who are profiting through sugar rationing, aside from those who sell back market sugar. When sugar is purchased for about 10 cents per pound and resold in processed foods at more than one dollar per pound, somebody is making a profit, and larger than that made by the black market operator.

The only thing that removed meat from control was public opinion. In spite of the fact we were told there would be a meat famine if controls were lifted public opinion became so strong they were removed. There hasn't been a shortage of meat yet and from all appearances there won't be. Do you suppose the same thing might happen in the case of sugar?

Spring pigs can be saved. At least that is what Ralph Sayler, manager of L. H. Haltom's farm near Chapel Hill, says. With 17 registered Poland China broodsows to care for, Sayler has kept losses at an average of less than one pig per litter. That represents an approximate 10 per cent loss while the state average loss of pigs farrowed is 35 per cent.

Farrowing pens with sloping floors or with one side elevated, electric pig brooder, and a little extra attention at the right time are the three factors responsible for saving a high percentage of pigs farrowed, according to Sayler.

It is human nature for people to be lax in the management of activities involving numbers. We all know that we spend money more freely when we have several dollars in our pockets. That same attitude is taken by many when it comes to caring for a litter of pigs. We feel that if two or three are lost out of a litter of seven or eight no one will be hit too hard—therefore no extra attention is given brood sows at farrowing time.

Nature has equipped the animal with the neans of making its own bed and that is what a majority of farmers allow, winter of summer, which results in many pigs being lost from freezing, drowning, smothering or mashing, yet there are usually a few left in each litter.

When it comes to cattle and sheep the story is somewhat different because we know if the calf or lamb is lost then all the profit from that animal is lost for the next year. Therefore we are more careful with those types of livestock than we are with swine

Though it would always be to the farmer's advantage to prevent the loss of pigs that fact is particularly true this season. No doubt hogs will demand a very desirable price for the next year and maybe longer. We don't believe the market for pork will remain as high as it has been for the past few weeks, nevertheless it will be a profitable business for those who have the hogs now.

He never had such a tough time in his life. First he got Angina Pectoris, followed by Arteriosclerosis. Just as he was recovering from these he got Pneumonia, followed by Pulmonary Phthisis and Tuberculosis. Somehow he got over them just in time to get Appendicitis, to say nothing of Pyorrhea. All in all, he never knew how he pulled through it. It was the hardest spelling test he'd ever been in.

The Cost of Food

The U. S. Department of Agriculture recently published some interesting information on the cost of food. In making its comparisons, the Department figures the cost of a "market basket" of typical foods purchased by the average family. On March 19th, the value of that market basket was still 7 per cent below the record level reached in 1920. And, of great significance, marketing charges in 1946 were 21 per cent lower than the 1920 high

This means, in short, that food retailers have greatly improved their operating efficiency and economy. And that fact is given further substantiation in other figures released by the Department. The farmers' share of the retail cost of the "market basket" averaged 40 per cent during the 1935-39 period—where in 1946 it had climbed to 53 per cent.

In all lines. merchandise as well as food, the overhead costs and unit profits of retailers have tended downward. The trend has been steadily in the direction of bigger volume at a smaller cost per transaction. This simply means that much of the savings resulting from greater retailer efficiency has been passed straight on to the consumer. It also means that there's no sense in blaming the retailer for today's high prices—he's not responsible for them. He is doing all he can to solve the tough cost-of-living problem.

Livestock Diet Should Be Changed Gradually

Sudden changes in livestock feeding should be avoided, thus helping to keep digestive troubles at a minimum, animal husbandmen of the U-T College of Agriculture, have announced. A gradual change from summer forage to a winter diet of hay and grain is advocated.

Because the symptoms of indigestion are often similar to those of other livestock diseases, farmers are advised to obtain a diagnosis as soon as an animal becomes ill, to determine the exact problem and the measures that should be used to correct the situation. Care is especially recommended in shifting to a diet largely composed of new grain. Feeding changes should be very gradual.

Salvation at Southern Christian

Training for Practical Rural Ministry
John Long

THE ONLY DIFFERENCE between "soil" and "soul" is "u" and "i."At Southern Christian Institute we have concluded that the first step in saving souls is to save the soil. It took no profound thinking to arrive at this conclusion. We had merely to look around us. We saw once strong rural churches become churches with half-time or quarter-time services and then die completely. Why? The people had moved away. Why? The top soil had moved away, too, and the land could no longer support the people.

What we saw nationally presents a sorry picture. Of the estimated average of nine inches of top soil which the early settlers found on our land when first they reached these shores we have caused five inches to erode away. Thirty-five million acres of our soil have been completely ruined by gully erosion. Ruined beyond repair. Another 125,000,000 acres have lost all their top soil; and still another 100,000,000 acres are well on the way to total loss. Three billion tons of soil are washed away every year. Our Mississippi River alone carries 428,000,000 tons of soil annually.

This is not only bad in and of itself but, after the productive top soil washes away from the unprotected hills, the sterile subsoil is then washed down to cover good bottom land and make it also unproductive, the rivers become filled with mud and serious floods endanger farms and cities for many miles.

This concerns the church because with the depletion of the soil the people can no longer support an active church program. Poor soil makes poor people. This is nowhere better illustrated than in the area served by the Southern Christian Institute.

We have in the South only 28.3 per cent of the nation's land, but sixty-one per cent of the nation's badly eroded land is here. The U. S. Census for 1940 showed that here in the South only 13.6 per cent of our houses mett an acceptable standard and that 56.6 per cent of them are so bad as to be nonrepairable. The rest of the nation had 52.5 per cent acceptable houses. The farm income of the South was only $380 per worker. This average included white and Negroes. The figure for Negroes alone might show only that low amount per family. The only thing that eroded soil produces is eroded souls. Actually to save itself the church needs to preach and practice soil conservation and rebuilding.

Saving Eroded Soil and Souls

FOR LONG YEARS the Southern Christian Institute has recognized this as its first responsibility. On its plantation of 1,265 acres it has pioneered in farm practices to conserve and rebuild the soil. While the school is not an agricultural college yet many people look to it for help and for example in better methods of farming and for improved livestock. The farm is managed by B. L. Jacobs and his assistant, H. S. Thomas. Mr. Jacobs is a graduate of the school and as a student or as manager has been connected with the school farm for thirty-five years. Mr. Thomas grew up on a good Illinois farm before graduate from Eureka College. Both are real agricultural missionaries whose influence is widely felt.

Another means of solving this rural problem is in the extension service offered by Southern Christian. A traveling library carries books and magazines to the schools and homes of the area. It is the only such library service for Negroes in the state.

Rural public school teachers attend special courses on the campus each Saturday and for a special six-week course when their schools are closed in the spring. Similar classes are held for the teachers in a neighboring county. Last year 114 teachers attended these special classes for rural teachers.

The school motion picture projector is in continual use in the schools and churches of the area where they have electricity. Large numbers of white and Negro people thus see excellent sound films on soil conservation, better farm practices, health and religion. We are hoping to be able to get a portable generator so that this valuable service can be extended to the many communities without electricity.

The Rural Minister

MORE RECENTLY THE School has set up an intensive program to attack this problem through the rural minister. In 1944 W. K. Fox was appointed our director of religious extension.

The key person in almost any Negro community is the Negro minister. He has always been a powerful influence, but not always for good. With the recent coming of better-trained teachers into the communities, many of these ministers have felt their power and position threatened and real conflict has resulted between the teacher and the preacher.

Our task is to help them see that essentially they are doing the same job. Both are interested in saving people: saving them from ignorance, saving them from disease; saving them from poverty; saving them from all other sin; and helping them to live abundantly.

Mr. Fox spends a good share of his time training ministers and helping them to plan a program which will include the total life of the people. He has held scores of conferences and institutes all over the state.

The first Pastors' School led by Mr. Fox was held on the campus in 1944. It lasted for one week. Thirty-one ministers from five denominations attended. Last year the time was extended to two weeks and this year to six. Besides these interdenominational schools we have had two institutes for ministers of our Christian churches.

The program for these schools includes courses in understanding and use of the Bible, counselling, pastoral work, evangelism, education, finance, general administration preparation and delivery of sermons, and the like; but the whole emphasis is on the rural ministry.

The afternoon and night programs are given over to field trips, demonstrations; to motion pictures on soil conservation and the improvement of rural living. They were conducted by county agricultural agents, regional and state soil conservation agents and representatives of state health and education departments.

The whole program was practical and down-to-earth. For example, the men painted a neighboring church and planted native shrubbery which they dug from the woods. In another church they made screens and hung curtains and made worship centers to show how with little cost a small one-room church could better provide for its Bible school classes.

Schools for Rural Women

THE PAST TWO SUMMERS we have had schools for rural women. Forty-nine women representing six denominations spent a week on the campus. They had many courses and demonstrations from the eight faculty members to help them improve their homes and communities.

This last summer our regular daily vacation Bible school was held during the week of the women's school. An accredited laboratory training school was conducted during the week so that the women might get training to help them become better church school leaders. One hundred four children attended the school.

The Results

THE RESULTS OF THESE efforts are quite apparent in the improvement of the land, the homes, the schools and the churches. Not a single rural church in our area is unpainted. Preachers, who two years ago were preaching that play is sinful, are now helping schools and churches get playgrounds and equipment and are actually playing ball with their children. More and more the churches are becoming concerned with all that concerns their people and are helping them to live more abundantly. And the most striking result of all is the conversion of some white people who long have opposed the education of Negroes.

Truly, there is salvation at Southern Christian Institute.

Make the Farms Hum

By Grace Armstrong Allen

Now is the time for all good beekeepers to come to the aid of the bees. Or anyhow, now is about the time, depending on weather conditions, for beekeepers to contract hive entrances for winter, Sometimes this should be done by mid-November; some Novembers are so mild in Middle Tennessee that the majority of beekeepers wait until December comes shivering up over the horizon.

The regular entrance contractors put out by the bee supply houses are cleats about 7-8 of an inch square, and 14 5-8 inches long (which is the width of the standard hive entrance. There are different sized spaces cut out on different sides of the cleat. This entrance contractor is to be inserted into the hive entrance in the position that will allow whichever sized opening the beekeeper prefers to give his bees in winter. We ourselves use the opening about two inches long and 3-8 of an inch high.

There are two reasons for these reduced winter entrances. One is rather obvious. It's the same reason why we ourselves in fall start closing doors and windows that have been open all summer. It's a simple matter of cold weather.

Yet the bees must have some opening, not only for air, but also to pass through on mild days. Winter days warm enough to permit bees to take a short flight come rather often in our climate. Beekeepers speak of "cleaning flights" in winter. Normally honeybees do not void their faces within the hive, even in winter when they may be confined for weeks. Only under some unusual and serious circumstances will they do so, as when poor stores or too long confinement may cause dysentery. So when bright warm days interrupt the cold of winter, we are all glad that the bees can take these occasional flights.

The second reason for reducing entrances in winter is to keep out field mice. Bees will never permit a mouse to enter, nor will mice often try to enter, while bees are active. But after cold weather has induced the relatively quiescent state of the winter cluster, the pestiferous field mouse may come slipping slyly in and set up housekeeping in the protection and comparative warmth of the hive. Many a set of combs has been ruined this way.

Some beekeepers who possess proper tools make their own contractors. Others, not so well equipped, just saw a thinner board, perhaps 1-4 inch thick more or less, to the desired size, say 14 5-8 by 1 1-2 inches. They cut out a small space for the entrance, put a short nail in each upper corner, and with one or two quick strokes of a hammer fasten this contracting board to the hive, across the entrance.

Although we recommend factory-made equipment, these home-made entrance contractors do very well. We have used them ourselves. But sometimes beginners have made the entrances high enough for mice to squeeze in, with disastrous results. To correct this, they have later tacked across this too inviting entrance a strip of hardware cloth—about three wires to the inch. This will let the bees pass in and out easily, but will keep out the unwelcome field mice. Hardware cloth used to be easy to buy, but in these queer Short 'Forties, who knows where who can buy what?

If you have half a dozen hives of bees and think that for some reason they should be moved 50 feet or a 100 yards, right now is a good time to do it, while the weather is cool but not cold. Move them after they have stopped flying some evening, and throw some brush or something similar across the entrances. Next morning they'll say (if you have a good imagination), "Goodness! where are we?" Then they'll mark their new location. But don't leave any hive at all in the old location, or some of them may go back.

Lauderdale County Farm Women Build Toward Better Kitchens

Farm women of Lauderdale County, Alabama, have decided to improve their kitchens this year. They have already started a campaign to improve lighting, walls, storage space, and make useful articles for the kitchen. Improved furniture arrangement will save time and energy.

To improve the lighting in their kitchens, homemakers are painting drab, dark walls and ceiling in light colors. More windows are being put in kitchens where there are one or two small ones.

Rearranging furniture in the kitchen according to work to be done will save Lauderdale farm women lots of time and energy. Work centers will cut down on the time needed to do the many jobs in a farm kitchen.

Lauderdale homemakers are making pretty curtains, towels, and pot holders from inexpensive materials such as sacks and yellow domestic.

Mrs. Lucy Anderson, Oakland Community has started already to make her kitchen more inviting. She has bought a new stove, and has built shelves for her kitchen utensils. Beautiful curtains, which she made from feed sacks, add much color to her kitchen windows. In order to have more space for her canned foods, she has built shelves in her pantry from scrap lumber.

This homemaker's greatest wish is to finish improving her kitchen before she begins work on the farm in the spring.

1946 Banner Year For Five 4-H'ers

Last year was a banner year in 4-H club work for Bonnie Jean Dunn, Ethel Mae Beal, Vera Mae Foster, Willie Albert Dunn and Joe Louis Foster, Mount Zion Community, Tuscaloosa County. With the help of their parents, leaders and agents, each member completed at least one successful project.

Bonnie Jean Dunn had two rows of tomatoes in her mother's garden. First, she planted her seeds in a hotbed in the early spring and then reset them in the garden. From her project she canned 36 pints of tomatoes, 15 quarts of soup mixture and had fresh tomatoes for the home.

Ethel Mae Beal grew six varieties of vegetables in her garden. She followed practices recommended by her county agents. From it, 25 quarts of vegetables were canned and plenty of fresh vegetables were used.

Early in the spring Vera Mae Foster bought 25 chicks. As a result of good management she raised all of them. Ten of the pullets were saved for layers and the others were used for the family.

From three rows of cane, Willie Albert Dunn made 22 gallons of syrup. He plans to sell the syrup at $2.50 per gallon and use the money to help with his school books, clothes and lunches.

Joe Louis Foster had two rows of cane. His yield was very high and he bedded all of the cane for his own use and for sale in the community.

Get Ready Now

Farmers who plan to sow a permanent pasture or set kudzu should see about getting fertilizers, pasture seeds, and kudzu crowns. Land preparation should be finished soon on areas where the danger of erosion is not great, say API extension agronomists.

The Department of Taxation received a typed income tax return from a bachelor who listed one dependent son. The examiner returned the blank with a pencilled notation: "This must be a stenographic error."

Presently the blank came back with the added pencil notation, "You're telling me!"

100-Page Negro Workshop Report Released by Extension Service

A 100-page report of the regional workshop for Negro supervisors of State agricultural extension work, which was held at Southern University last fall, has been released by extension Service of the U. S. Department of Agriculture.

The report contains summaries and outlines of lectures and addresses by experts in the field of agriculture and education; it also contains the findings of workshop committees, composed of supervisors and consultants, who studied various aspects of the problem of Extension supervision.

Although the report represents a professional approach to the problems of supervision, the ultimate consumer, the farmer, is not overlooked. The solution to every problem of supervision covered in the report points to ways and means by which state and district supervisors may improve their guidance of county agents to the end that farm people may be better served.

Among the special lectures and addresses summarized or outlined in the report are two on mechanized cotton production by H. H. Williamson, assistant director of Extension Service, and Charles A. Bennett of the Mississippi Delta Cotton Experiment Station. One on rural health by Dr. Roscoe C. Brown of the U. S. Public Health Service, and two on rural housing by S. P. Lyle and T. M. Campbell of Extension Service.

Also included in the report are summaries and outlines of talks and special lectures by Dr. Paul J. Kruse of Cornell University, Dr. Felton G. Clark, president of Southern University, Dr. Ambrose Caliver of the Office of Education, Charles A. Sheffield, John W. Mitchell, Cal Svinth, and C. W. Davis of Extension Service.

The purpose of the workshop, as well as that of the report is summed up in the foreword by H. W. Hochbaum, Chief of the Division of Field Coordination. Says he:

"This workshop on Extension supervision was an effort to provide opportunity for the state agents and district supervisors to study their job, involving program development, leadership, personnel, training, and evaluation to find what adjustments might well be made to better fit the work to the needs of the people."

Fifty-one State and district supervisors from 14 Southern States were in attendance at the workshop. The report is in large part the work of this group. Copies of the report have been made available to the libraries of all of the Land-Grant and agricultural colleges.

Cotton, Milk Income Compared by Teague

The sale of a gallon of milk a day will give about the same income as a bale of cotton each year, says C. E. Teague, API extension dairyman.

For a 20-year period, 1925 through 1944, the average yearly cash income from one 500-pound bale of cotton was $66.95 and from one gallon of milk per day on the wholesale market $64.21.

Farney Family Lives at Home

In 1946 the Farney family of ten Wylam Community, Jefferson County, worked together in producing enough food to last all during the year. They believe in living at home.

The Farneys had a year round garden and an orchard from which they canned 600 quarts of fruit, vegetables and preserves. They grew more than enough grain to feed two cows, one calf, a flock of 50 laying hens, 30 fryers and 20 broilers. They had a good supply of eggs, syrup, butter, potatoes and peanuts the year round.

This year the Farneys have started a turkey project beginning with fifteen poults. Heretofore, they have been raising turkeys for home us only, but now they plan to raise them for the market.

Test Demonstration Set Up in Limestone County Area

Another phosphate unit test demonstration area was organized in Limestone County last week in December. It is known as the Little Elk Demonstration Area and is located at the forks of the Elks and Tennessee Rivers. Little Elk is a community of about 20 Negro farmers. In fact, it is the first phosphate demonstration area to be set up in this county in a community where all demonstrators are Negroes.

The phosphate used by these demonstration farmers will be manufactured and supplied by the Tennessee Valley Authority through the Limestone County Soil Conservation Association. The Extension Service will assist in the supervision and direction of the program.

Under this program the material will be supplied to these farmers to be used under cover crops, pastures, etc., and farmers will keep records of the progress made over a period of years in building up and improving their farms through the use of phosphate, lime and cover crops.

The area has in it about 1500 acres of land. At a recent meeting, attended by 87 Negro farm men and women leaders of that community, final organization was completed. The committee elected by the group to represent the cooperating farmers include Hendy Jones, chairman, Nathan Smith, Ephrain Jones, Joe Weaver, Jr., and Crite Yarbrough.

At the meeting, H. L. Hood, assistant county agent, explained the proposed program to those present and T. G. Williamson, chairman of the association, Mack Maples, president of the county farm bureau, L. M. Baugher, director of the association, B. F. Hill, Negro county agent, and others made short talks.

A barbecue supper was served to those present by the county farm bureau and the soil conservation association jointly.

Winter Grazing Cuts Feed Bill

John Thomas Bulls, Lauderdale County farmer, boasts of 20 acres of best winter grazing in the county.

On October 20, 1946, Mr. Bulls turned 12 steers and 8 milk cows and heifers on a 20-acre field of crimson clover and ryegrass that had made good growth. They were still grazing on this field on the 25th of December. His feed bill has been cut to a minimum. "I haven't fed them a time since I turned them on grazing crops," says Mr. Bulls.

The steers have made heavy gains and the cows are producing high yields of milk and butter. Bulls and the county agent feel that the cost of two tons of phosphate, one ton of ammonium nitrate and 800 pounds of seeds, partially paid by the P. M. A., have solved his feed bill. He has enough pasture to take care of more cattle if he had them.

Home Canning Saves Money

Mrs. Nancy Hawthorne, Friendship Community, Randolph County, figures that the 465 quarts of vegetables and fruits she canned in 1946 will save her around $220. This homemaker says that the things she learned at her home demonstration club have helped her to save more food for her family.

Mrs. Hawthorne is one of the four pantry store demonstrators in the county. Even though this is her first year in club work she has made many improvements in food preservation and storage. She planned a good conservation budget to meet the needs of the family of three. During the early part of the winter a meat canning demonstration was given at her home. Since that time, she has canned chicken, rabbits, and pork for her family.

As chairman of the Women's Home Demonstration Club, Mrs Hawthorne is helping to improve her community and county.

Hybrid Seed Hikes Corn Yield

The application of commercial fertilizer increased the corn yields an average of 19.6 bushels at a cost of 42.6 cents per bushel for fertilizer materials in four demonstrations carried on in Lewis County, according to Assistant County Agent O. R. Holley.

The average corn yields in the test plots were boosted from 54.8 bushels to 74.4 bushels per acre, he said. The yield of the fertilizer plots ranged from 63.4 to 94.4 bushels per acre while the untreated check plots were from 38.7 to 86.1 bushels.

Thirty-four and one half more bushels were produced per acre on the farm of H. McCord where fertilizer was used than where none was applied. The yield was increased from 38.7 bushels per acre on the check plot to 73.2 bushels on the acreage fertilized. The cost for the boosted production was 26.7 cents per bushel.

While the increase on the farm of H. F. Lawson was not as great the yield was increased from 45.1 bushels to 63.4 at a cost per bushel increase of 50 cents. At a cost of 57 cents per bushel Luther Baxter hiked his production from 49.3 bushels per acre to 66.7 bushels.

Fertilizer applied on the land of B. F. Webb did not show as great an increase but the land is highly productive. The check plot made a yield of 86.1 while the fertilized plot yielded 94.4 bushels. The cost per bushel increase on this farm was 62 cents which in the light of the current price of grain is a very desirable net income. Holley pointed out.

There are 160 corn fertilizer demonstrations in 60 counties in the state this year, according to Bruce W. Hatcher, assistant agronomist at Nashville, who is in charge. The tests were conducted by the Tennessee Extension Service in cooperation with the Tennessee Fertilizer Council and the Tennessee Crop Improvement Association The row applications consisted of from none to 400 pounds of 4 12-4 complete fertilizer, depending on indicated need from soil tests, applied in the row at planting time, plus side dressing with 150 to 250 pounds of nitarte of soda before the corn was knee high.

At the time of harvesting, measured parts of each acre were made the corn was harvested weighed, and 80 pounds of husked ear corn was accounted to a bushel. However, moisture tests have been made on samples from each plot and adjustment upward was necessary in each case. The tests for moisture content indicated that the correct weights per bushel ran from 71 to 75 pounds.

Last spring each demonstrator was supplied with sufficient seed of Tennessee hybrid No. 10 to plant the acre. In all instances the corn was planted in close proximity to hybrid corns produced in neighboring states, and in all cases the farmers indicated the Tennessee hybrid compared very favorably in production with any of those from other states.

In one instance, a comparison was made by weighing the production from like areas. It was found that the hybrid from a neighboring state, after being fertilized with 250 pounds of 3 9 6 complete fertilizer, planted the same date, on similar soils, (abueting cultivation) the same, fell short of the Tennessee hybrid on the check plot which received no treatment.

The out-of state hybrid yield on fertilized area was 45.3 bushels per acre as comparing with 66.7 bushels for fertilized Tennessee No. 10. on similar soil and growing conditions. Another factor in favor of the Tennessee No. 10 is that the shucks cover the tips well thereby protecting them from injury by insects, birds and rain. Some of the out of state hybrids have been considered weak in this respect.

However, Tennessee No. 10 has a decided weakness and that is that the stalks are too weak to hold up the big crop produced and there is considerable lodging This factor was particularly noticeable in the heavy-producing plot of the Webb farm

Another observation about the tests is that there is a close correlation between the number of stalks and the yields. The plot which produced 94.4 bushels was estimated to have 7,000 stalks while some of the areas were calculated to have 4,950 and 5,100 plants, respectively.

As long as corn is fairly high, priced it appears the use of commercial fertilizers is justifiable. The growing of winter legumes and Austrian winter peas to which such as crimson clover, hairy vetch liberal application of superphosphate are given on fields which are to be planted to corn immediately following have been found to give increased corn production at very cheap costs. This is probably the method by which to increase corn production at lowest costs.

Applications of large quantities of barnyard manure will probably rank second in production costs, while the use of complete commercial fertilizers will follow in third place. However, all three methods are needed and should be used.

Winter Care of Water Systems Is Important Job on Farms

By Keneth B. McPherson

Every winter many pumps and electric water systems are damaged by freezing. This type of accident is not only expensive for repair, but it also causes the inconvenience of being without running water. With very few exceptions indeed such accidents are preventable.

In many cases the job of prevention or protection against freezing is simply put off until the zero day comes when the task resolves itself into one of thawing out. By that time the outside weather is so disagreeable that completion will be delayed until it warms up. It is then usually difficult to get a job done in the summer that will not cause trouble again until next winter.

When thinking about protective measures for winter protection of water systems, here are two classes of installations to consider. Those in expose locations such as unheated farm buildings and summer cottages, and those that are afforded some protection by their location in basements, well pits, or semi-frostproof houses.

There is another class of installation that should be mentioned That is the stock water system that has no building protection and is usually located at some distance away from any farm building.

No chances should ever be taken with any water system that is placed in an exposed location. When cold weather and freezing temperatures first approach, they should be carefully drained. That is the only safe thing to do even though it may be terribly inconvenient. When it is necessary to pump water, the system should be operated in the day time only and then drained at night.

To drain most shallow well or suction type pumps, all of the drain plugs must be opened and the pump run for a few strokes so the water trapped above the valves will be released. If the water happened to drain or siphon back to the pump, it will be released by disconnecting the pipe line.

A suction line will not drain if it is equipped with a foot valve. In such cases the line should be disconnected at the well or the spring

Where pumps are located in shallow pits or houses that are not entirely frostproof, care should be taken that the oil is not too heavy To insure effective lubrication it may be necessary to change the oil to a grade or two lighter.

Fortunately, most water systems are permanently housed in shelters that offer considerable, protection where special attention is not necessary except in extreme weather. The principal danger arises from the failure of someone to close a door or window or the well pit cover.

A small electric heater or a high wattage lamp is excellent equipment to have on hand for use in extremely cold snaps.

Where sections of exposed pipe cannot be avoided, they can be insulated with a jacket that is manufactured for the purpose.

Surprising as it may seem water systems installed in extreme northern latitudes seldom freeze There people have a wholesome respect for winter, and do not take many chances with the weathermen.

WOMAN'S PAGE

Let's Try Yeast Breads

By Mary Meade

A Basic sweet yeast dough is used for the more glorified breads. It's much the same as ordinary bread dough except for the addition of eggs and extra amounts of shortening and sugar. Because of its richness the dough is softer and stickier, but many of the same breadmaking steps apply and a similar technique is used.

Liquids must be just right for proper yeast development. Milk should be scalded and water boiled to destroy organisms which harm the yeast cells, then cooled to lukewarm before the yeast is added, as extreme heat interferes with yeast growth.

When making form cake and hot cross buns it isn't necessary to knead the dough, but there must be thoro beating. Kneading or beating instructions, however, should be followed exactly as given in the recipe.

Ideal rising temperature is between 80 and 84 degrees, and it should never be lower than 75 or more than 90 degrees. The dough may be placed on a radiator to rise if it's protected from direct heat by the use of a board or several thicknesses of heavy towels. Covering the dough while rising protects it from drafts and prevents drying out.

From the following recipe many good coffee cakes, buns, and sweet rolls may be baked, including the tea ring and rolls:

Basic Sweet Yeast Dough

(Two 12-inch rings or three dozen rolls)

1 cake "household" yeast or
2 small cakes compressed yeast
1-4 cup lukewarm water
1 cup milk
1-4 cup shortening
1-2 cup sugar
1 teaspoon salt
2 eggs, beaten
1 teaspoon grated lemon rind (optional)
5 cups sifted all-purpose flour (about)

Soften yeast in lukewarm water. Scald milk and to it add shortening, sugar, and salt. Cool to lukewarm and add flour to make a thick batter. Add yeast, eggs, and rind. Beat well and add enough more flour to make a soft dough. Turn out on a lightly floured board or pastry canvas and kneed until satiny. Shape into a ball, place in a lightly greased bowl, cover with a plate or towel away from drafts, and let rise until doubled in bulk. Punch down, then shape. Let rise until doubled and bake at 375 degrees, allowing 20 to 25 minutes for rolls and 25 to 30 minutes for coffee cakes.

Swedish Tea Ring

Roll out half a standard yeast dough recipe into a rectangular sheet about 12x14 inches and 1-2 inch thick. Spread with 1-4 cup melted or soft butter and 1 cup chopped candied fruit, 1-2 cup chopped pecans, and 1-2 cup brown sugar. Place the filling as near the edges as possible, then roll as for a jelly roll, moistening the edge with water to make the roll hold together. Pull out about 22 inches in length, place on a greased baking sheet, and shape into a ring. Using scissors, cut 20 or any even number of gashes around the outer edge, cutting almost thru. Lift slices slightly upward and place on sides, turning every other one in the opposite direction to form a heart-shaped section. Press entire ring flat to make the dough an even height. Cover, let rise until doubled then bake at 375 degrees for 25 minutes. Before serving, trickle thin confectioners' icing over the top.

Bowknot and Foldover Rolls

For bowknots roll dough to a fourth inch thickness and cut into strips a half inch wide and six inches long. Brush lightly with melted butter and tie each strip in a knot, leaving the ends free or tucking them under. For foldovers roll dough to the same thickness and cut into three inch squares. Fold opposite corners of each square to the center and press the points together firmly. Glaze some with an egg yolk mixed with 2 tablespsoons water and top with poppy or caraway seeds before baking, or use thin confectioners' icing with chopped nuts after baking.

USE LESS FLOUR

When making your white sauce with homogenized milk use less flour than ordinarily. This creamy milk makes a thicker sauce.

GINGER WAFFLE DESSERT

To make a simple dessert with all the airs of a partytime flavorite, bake gingerbread batter in the waffle iron. Put canned cling peach slices between two waffle layers, top with more peaches and whipped cream.

BAKED BANANAS

A particularly delightful menu variation is baked bananas. To prepare, slice the fruit in halves lengthwise, place in a baking pan, brush with melted butter or margarine and sprinkle with chopped nuts. Bake in a moderate oven (375 degrees) until tender.

A stew, to you, may be just a dish you make on Monday, from Sunday's roast, but serve a stew like this one . . . with **Vitalox.** Armour's beef flavor-maker making it rich, brown and extra-delicious, and any stew you make will be a sensation. Ask your Grocer for **Vitalox,**—then try this recipe!

Old-Fashioned Beef Stew

1 1 1-2 lbs bonless beef
2 tbsps. flour
1 c. chopped onion
2 tbsps. lard or other fat
2 c. boiling water
1 bay leaf
4 whole cloves
1 tsp. salt
2 tbsps. VITALOX
1 c. celery
4 carrots
4 small potatoes

Cut meat in 1 1-2 inch cubes and roll in flour. Brown meat and onion slowly and thoroughly in fat for 15 min. Add water, salt, VITALOX, cloves and bay leaf. Turn heat very low, cover and simmer for 1 1-2 hours. Now add carrots cut in strips, potatoes in quarters, and celery in 1-2 inch slices. Add another cup of water and I more tsp. salt. Cover and cook 30 min. Mix 1 tbsp. flour with 3 tbsps. cold water and stir into gravy to thicken it just before serving. (4 servings.)

PROTEIN FIBER

A new fiber called "sarelon" made from peanut portein has been produced on an experimental scale in the Southern Laboratory of the U. S. Department of Agriculture. The new fiber is a light cream color and has a pleasant softness midway between that of silk and wool.

EGGS A LA SUISSE

4 eggs
1 tablespoon fat for frying
1-2 cup light cream
2 tablespoon cracker or bread crumbs
Buttered toast

Melt fat in pan. Add cream and heat to bubbling. Slip in eggs, one at a time; cook gently. When whites are almost firm, sprinkle crumbs over top. Cover and continue cooking to desired doneness. Transfer eggs to toast. Pour the "pan cream" over all. Season with salt, pepper and a dash of cayenne

POTATO VARIETY

Boil patotoes in the jacket. When tender, peel while hot. Melt two tablespoons of bacon drippings in frying pan. When hot put in the potatoes and brown well. Drain, sprinkle with salt and one-half teaspoon of caraway seeds.

Steam kale until it's tender in a little melted fat in a flat covered pan.

Jam or preserves makes a gay sauce to serve over vanilla ice cream.

ONIONS IN CHEESE SAUCE

3 cups tiny green onions
1 cup evaporated milk
1 cup granted or diced cheese

Remove outer skins of onions carefully. Cut off most of green tops. Cook onions, just until tender in boiling salted water, about 6 minutes. As onion cook, combine milk and cheese in top of double boiler or over very low direct heat. Stir until cheese is completely melted and sauce in thick. Drain onions, place in a heated serving dish and pour cheese sauce over them. Yield: six servings.

The sauce combines well with other vegetables and is also delicious over open-faced sandwiches made with favorite combinations of seafood, or over stuffed eggs. A dash of mustard or hot sauce gives a pleasant tang.

FROZEN APRICOT CHARLOTTE

1 envelope plain unflavored gelatin
1-4 cup cold water
1-3 cup boiling water or apricot juice
1-4 cup corn syrup or 2 tablespoon sugar
1 cup cooked apricot pulp
1 teaspoon lemon juice
1 cup cream, whipped
2 egg whites
1-4 cup sugar

Soften gelatin in cold water and then dissolve in boiling water or apricot juice. Add 2 teaspoons sugar or 1-4 cup corn sprup, apricot pulp and lemon juice. Cool and when mixture thickens, beat until frothy. Fold in whipped cream and stiffly beaten egg whites sweetened with remaining sugar. Pour into refrigerator tray and freeze until dessert can be sliced for serving, or turn into individual waxed paper dessert cups to mold while freezing. Serves 6.

The broad-breasted bronze is a breed of turkey particularly important for hotels, restaurants, and other users of food in quantity. This specially developed bird has 15 per cent more breast meat than the standard turkey.

GINGER ICE PEACHES

Add a few tablespoons of sugar and a speck of lemon juice to the juice from a can of cling peach halves. Stir in enough chopped candied ginger to make it spicy and pour into freezing tray and chill until firm. Stir occasionally. Chill peach halves and serve with a mound of ginger ice in each peach half. Top with a few shavings of candied ginger. Serves 4.

SANDWICH FILLING

To make a tasty filling for three sandwiches, blend well 2-3 cup shredded carrots, 1-4 cup seedless raisins, 2 tablespoons salad dressing, a dash of salt and a dash of pepper.

Bake waffles until steaming from iron stops.

HAM-MUSHROOM MOUSSE

1 envelope unflavored gelatin
1-4 cup cold water
1 egg
3-4 cup cold water
1 teaspoon salt
1 teaspoon prepared mustard
1 cup milk
2 teaspoons finely chopped onion
1 teaspoon vinegar
1-4 cup chopped celery
1-4 cup chopped green peppers
1 cup cooked ham, finely chopped
1 cup sliced, cooked mushrooms (8 ounce can)
1-2 cup cream, whipped

Soften gelatin in bowl in 1-4 cup cold water. In top of double boiler, beat egg and add 3-4 cup water, salt, mustard, and milk and cook over hot water until mixture thickens, stirring constantly. If mixture separates, beat with rotary beater until smooth. Add immediately to softened gelatin, stirring until gelatin is dissolved. Stir in onion, vinegar, celery, green pepper, ham and mushrooms, (reserving a few mushrooms for garnish). Chill and when mixture begins to thicken fold in whipped cream. Rinse a three-cup mold in cold water and place mushroom garnish in mold, pour in mixture and chill until firm. Unmold and serve garnished with salad greens. Serves 6.

DATE TORTE

1-2 cup dates, 1-2 teaspoon soda, 1-2 cup boiling water, 1-2 tablespoon butter, 1-2 cup sugar 1-2 cup nut meats, 1-2 cup flour, 1 egg, well beaten, whipped cream.

Cut the dates up fine and sprinkle with soda. Pour over boiling water and let stand until cool. Work the butter until creamy, adding sugar gradually. Add to late mixture with nut meats chopped fine. Then add flour and well beaten egg. Turn into pan lined with wax paper and greased. Bake forty minutes at 300 degrees. Serve with whipped cream. 4 servings.

FROM BOARD TO CLOTHES

A brownish tinge that appears on white clothes during ironing may come from a scorched ironing board cover. When very damp clothes are ironed, some of the brown color may come off the ironing board and onto the clean fabric. In the same way, other soluble stains on the ironing board may be transferred to clothes during ironing. This is one good reason for regularly changing the cover on the board.

Raisins contain as much as 66.5 per cent sugar.

With Tennessee Home Makers

By Helen Cullens
District Home Demonstration Agent

From my oun experience, I know how very provoking it is to get a stain on a freshly cleaned dress. I've found there are three things I can do about it. First, I can just ignore the stain; but that isn't a very good idea. Since I know the grease stain or spot is there, the fact preys on my subconscious and conscious mind and damages my self respect; Of course, I could immediately send the dress to the cleaners again; but there I am entailing a lot of extra expense where I should be saving. Third, I can do something about removing the spot, myself.

Since there have been several requests lately from readers who want to know how to remove stains from fabrics, I offer some suggestions on removing them. It is best, always, to remove stains from articles or garments before laundering them. Too, the more quickly a stain is treated, the easier it is to remove. Let them stand, and they are apt to be troublesome.

Adhessive Gum: To remove from wool or silk, sponge alternately with carbon tetrachloride and water; from cotton and linen, soften with egg white and wash or use carbon tetrachloride. For rayon, the treatments is the same as for silk.

Candle Wax: To remove from wool or silk, scrape off as much wax as possible. Place blotter beneath and above stain. Press with hot iron. Remove remaining grease with carbon tetrachloride. For cotton, linen and rayon, the treatment is the same.

Coffee: On wool and silk, if the stain is fresh and the material washable, pour boiling water on stain from a height of 2-3 feet. Otherwise, sponge with lukewarm water. If coffee contained cream and grease spot remains, apply carbon tetrachloride. To remove stain from cotton and linen, soap and water are generally effective. On white materials, drying in sun will frequently remove traces. Bleach may also be used. For rayon, the treatment is the same as for silk.

Fruit: To remove from wool or silk, fill bowl with steaming hot water, add a few drops of ammonia, spread fabric over bowl, then apply hydrogen peroxide from a medicine dropper at intervals of about five minutes. Test unexposed part of fabric for color fastness. For cotton and linen, pour boiling water from a height through the stain. Do not use soap. If the stain is old, first rub well with glycerine, then use boiling water as above. For rayon, use the same treatment as for silk.

Grease: To remove from wool or silk, spread out fabric with absorbent pad or blotting paper under it. Cover spot with a layer of fuller's earth, starch, or talcum powder, then a layer of porous paper. Iron paper above spot. Brush clean and repeat if necessary. For cotton or linen, use soap and water if material is washable. Use carbon tetrachloride, if it is not. For rayon, the treatment is the same as for silk.

Lipstick, Rouge: To remove from wool and silk, work a colorless grease into stain. Bunch up material and dip into carbon tetrachloride, or sponge with that solvent. If a trace of color remains, sponge with diluted denaturned alcohol. The cotton, linen and rayon, the treatment is the same.

Paints: To remove from wool and silk, soften hardened paint with turpentine, if necessary, then apply carbon tetrachloride. For cotton and linen, if washable, soak in equal parts of ammonia and turpentine and wash in suds. Otherwise, treat the same as for wool and silk. The treatment for rayon is the same as for wool and silk.

Scorch: To remove from wool and silk, little can be done for badly injured fibers. Dampen and lay fabric in sun. On wool, brush with fine emery paper. Light scorches can sometimes be removed from silk by moistening a cloth with hydrogen peroxide and covering the spot. Cover with dry cloth and press with warm iron. For cotton and linen, dampen and lay fabric in sun, repeating is necessary. For rayon, the treatment is the same as for silk.

OYSTER CASSEROLE WITH FRESH MUSHROOMS

3 hard cooked eygs, peeled
1 pint oysters
2 tablespoons butter
1-4 pound fresh mushrooms, sliced
1 tablespoon onion, chopped
2 tablespoons butter
1-4 cup flour
1 cup evaported milk
Liquid drained from oysters
1 teaspoon salt
1-8 teaspoon black pepper
Few grains cayenne
3-4 cup buttered bread crumbs

Cut eggs in quarters and arrange in bottom of a greasel 1 1-2 quart casserole. Drain liquor off oysters and save for sauce. Look over oysters and remove bits of shell. Place a layer of oysters over eggs in the casserole. Melt two tablespoons butter in saucepan, add mushrooms and onion and saute slowly about five minutes. Remove mushrooms and onions from saucepan and arrange in a layer over oysters. Melt two additional tablespoone butter in the saucepan. Stir in flour, gratdually blend in milk, and cook over heat until thickened, stirring constantly to keep smooth and free from lumps. Add oyster liquor, salt, pepper and cayenne to sauce. Pour over casserole. Top with buttered crumbs and bake in a moderate oven (350 degrees) until bubbly and crumbs are browned, about 25 minutes. Four generous servings.

THE MODERN FARMER

VOL XX. NASHVILLE, TENN., JUNE 15, 1947 No. 5

Maryland Colored Farmers Exhibit High Grade Hams

NEW YORK STATE COLLEGE OF AGRICULTURE JUL 5 1947

Examines Home-Cured Hams

MRS. AMIE DAVIS, farm woman of Cedar Heights, Md., takes a feel of the best home-cured ham exhibited at the first annual Maryland Pork Show held recently at Upper Marlboro, Md. County Agent James R. Taylor explains to Mrs. Davis the prize winning features of the ham. The show is designed to stimulate farmers to improve their methods of curing meat.—USDA Photo.

High grade hams and bacon, canned chops, and smoked-links were exhibited by the colored farmers of Southern Maryland at their first annual Pork Show held recently at Upper Marlboro, Md., according to a report received by the U. S. Department of Agriculture from the Maryland State Extension Service.

The show has been initiated as an annual project, say Extension officials, to help stimulate farmers to improve their methods of raising livestock, and of butchering, and curing meats. Prizes for the best hams went to Mrs. Agnes Johnson, Mrs. Priscilla Moore, L. R. Patterson and Sydney A. Moore.

In addition to the exhibits, demonstrations were given in meat cutting, meat curing, and meat canning. County Agent James R. Taylor, who directed and planned the exhibit, says that within a few years he expects the Maryland Pork Show to compare favorably with the well known Georgia Ham and Egg Show.

THE BYRD NEST

By Rev. Bernard O. Byrd
—Guest Columnist.

STOP THE ENEMY

No cry, perhaps, is more frequent than that expressed in the subject, "Stop the Enemy." In the air-lanes, on the pages of our news publications, and from the platforms of our various places of assembly, we hear men and women in many exhortations saying, "Stop the enemy." No better step could be made; nor has any better step ever been made than to stop the forces which strive to bring us harm.

Much money has been spent in many ways to stop the enemy of man. Every dollar spent wisely is a dollar invested in safety. Many persons have given up their lives to stop an enemy which might bring injury and death to others. In such incidents, we can see the high cost and extreme value of stopping an enemy. A good motto or battle cry for these activities would be, "Stop the Enemy."

To be well qualified to stop the enemy, one must have a clear knowledge of his enemies' identity and whereabouts. Now, let us get acquainted with the enemy. I need not say much about the European and Asiatic nations which were at war with us, because even small children as well as the elders beyond three score and ten years know that the Italians, Germans, Japanese and some others are enemies to the people of the Americas. We have many enemies which are not across the sea. We have many enemies which do not use tanks, ships and guns. In fact, many of our greatest enemies are often nourished under our care and protected by our efforts. We are often forced to enter into hand-battles with discrimination, selfishness, partiality, disease, destructive habits and ignorance.

In speaking of discrimination due to feelings of superiority, I must admit, that such is not confined to any one nation, race or group. Of the many enemies referred to above, the writer feels that ignorance stands out as one of the foremost in destruction. Ignorance paves the way for discrimination. Ignorance broods selfishness, and builds a warm nest for partiality. Ignorance is the world's greatest hatchery for disease. Very few of the eggs fail to bring out trouble and misery when ignorance is setting on the nest. Ignorance destroys friendship, ambition, opportunity, fellowship, family solidarity, health and even life, itself. Ignorance prevents the unity of efforts by misused and oppress group. Ignorance has done more to keep men subjected and enslaved than any other known force. When ignorance divides leaders, it thereby divides the group which they represent; and when the group is divided, their defense is departed from before them. Ignorance is dangerous: Stop the Enemy.

Many persons think their enemies are the persons about whom others tell them. In many, many cases, the enemy is the tale-bearer. Some say my enemy is the fellow with the frown. Allow the writer

Regional Negro Extension Conference Held At Prairie View College, June 9-13

MONDAY, JUNE 9

T. M. Campbell, Chairman

1:00—Introductions, program announcements.

Greetings—Dr. E. B. Evans, President, Prairie View University, Texas.

1:15-2:45 P. M.—A review of the November 1946 Workshop

Regional discussion—J. W. Mitchell, U. S. D. A., T. M. Campbell, U. S. D. A.

For the states—

How to organize and conduct a workshop with county extension agent personnel.

Ross W. Newsome, Va.
L. A. Toney, W. Va.
Mrs. Marian Paul, S. C.
Mrs. Helen M. Hewlett, Okla.

Recess

3:00-4:00 P. M.—Organizing, outlining, and making annual reports

(a) For supervisors—
W. C. Davis, Tex.
Mrs. D. F. Lowe, N. C.

(b) For county extension agents—
W. H. Williamson, Tenn.
Mrs. Alice C. Oliver, Miss.

Tuesday, June 10

J. W. Mitchell, Chairman

8:30-10:00 A. M.—Techniques by which supervisors can evaluate their work and agents' work in counties.

Joe Matthews, Tex.
Discussion.

Recess

10:15 A. M.-12—Type of pre-service, induction, and in-service training needed

Dr. J. R. Otis, Ala.
Mrs. Ruby Hinton, La.

Teachers Urged to Plan Now For Next Terms School Lunches For Students

Washington, D. C.—The last few weeks of the school term are an excellent time for teachers, parents and school officials to make their plans for the next year's school lunch program, says the editorial of the May issue of Consumers' Guide, a U. S. Department of Agriculture publication.

The editorial suggests that plans be made now for school-community canning projects, as well as for phy sical improvements that are needed. These improvements can be made during the summer vacation period.

Report Wartime Contribution of City Youth to Food Output

The wartime contribution of city boys and girls to farm production is described in a 24-page pictorial publication issued last month by the U. S. Department of Agriculture.

Among the pictures are three of colored youth helping with the cultivation and harvest of important crops. The publication points out that farm work offers urban youth an opportunity for wholesome vacation employment.

During the war thousands of urban colored youths joined the Victory Farm Volunteers and helped with the cultivation and harvest of important crops.

JONES: "Is it true that the wild beasts in the jungle won't harm you if you carry a torch?"

PACIFIC VETERAN: "That all depends on how fast you carry it."

4-H Pig Show And Sale For Negro 4-H Club Members

G. W. Senter, Ass't County Agriculture Agent Reports

Nashville, Tenn.:—4-H Club Boys of Davidson County exhibited 25 fat hogs in the April 9-10 fat hog show. One vocational Ag boy exhibited 2.

The 27 hogs sold for $1,433.59, the average price of 27c, which was won by Marion Southall of Otter Creek School. Charles Southall, brother, showed the Reserve Champion which was a litter mate. Albert Flemmings won 3rd place in heavy weight class, Albert is a student at Bellevue School.

The show consisted of pigs from 5 different counties namely: Davidson, Giles, Montgomery, Maury, and Wilson. The amount or number of pigs from these various counties is as follows: Davidson 25, Montgomery 15, Maury 15, Giles 12, and Wilson 11, making a total of 86. Two were also brought in from the Vocational Department of Haynes High School, making a Grand total of 88 pigs for the show.

The pigs were classified into three groups namely: lightweight, medium and heavy weight.

Prizes awarded and the names of these 4-H club boys are as follows:

Light weights:

1st. Lee Ester Townsend
2nd. Samuel English
3rd, Robert Easley
4th. Odessa Townsend
5th. Charles Ewing
6th. Edward Allen Ogilvis
7th. W. J. Ogilvis
8th. A. Clifford Ewing
9th. Mizel Collins
10th, Emmerson Sweat
11th. M. C. Ogilvis
12th. George Ewing, Jr.

THOUGH HE DIED, YET HE LIVETH

It was black in Denmark that night of September 26, 1940. The dense gloom of Nazi occupation lay heavily upon the Danish people—both spiritually and physically. Nevertheless, 40,000 of them had gathered in the courtyard of Amalienborg Castle in Copenhagen, to pay honor to their king on his seventieth birthday. They sang and cheered lustily as they waited for their beloved monarch to appear on the balcony. When the door opened and he stepped out to greet them, tens of thousands of tiny flashlights, which most Danes carried during the blackout, played upon the towering figure of King Christian X. Standing in the brilliant illumination, he was both their symbol of freedom and their beacon of hope.

Now the King is dead, but his spirit is immortalized in the hearts of his people. If ever a man were worthy to stand at the head of a nation, it was King Christian—for he was a courageous man. If ever a man should rest in peace with God, it was King Christian—for he was a good man. If ever a man were well-named, it was King Christian—for his life exemplified the teachings of Christ, his Master.

Christian had always been popular with the Danish people. When he ascended the thorne in 1912, his reputation was that of a soldier and sportsman, rather than a political leader. During the thirty-five years that he reigned, he not only gained high esteem for his statesmanship and his democratic philosophy, but won the undying loyalty of his subjects.

It is easy to see why. In peacetime, Christian liked nothing better than to wander through the streets, window-shopping, greeting his friends—the people. He was a happy husband and father. He was a sympathetic and understanding ruler. He conducted his life in the spirit of the Golden Rule. It is not surprising that in 1920, when a general strike precipitated demonstrations for making Denmark a republic, they soon petered out, because no one could think of any candidate for the Presidency but Christian.

It was in wartime, though, that King Christian attained his fullest and greatest stature. Denmark, helplessly neutral, thought she was protected by her non-aggression pact with Germany. But Hitler's armies overwhelmed her in a night, and King Christian was forced to surrennder "under protest." It was a purely physical surrender a necessary expedient to avoid the wholesale slaughter of his people.

Morally and spiritually, Christian never backed down. He was the spearhead of the people's resistance to the invaders. He inspired them with courage, faith and hope. Until he was placed under palace arrest, he rode his white horse every day, through the streets of Copenhagen, giving his subjects words of encouragement. And even while under arrest, he managed to smuggle a message to his people and to the world: "We have allies in other countries fighting for our cause. Let everyone know that so long as the German are in this country, I will sign no decree forming a new Danish government. What I have signed so far has been forced. God protect you all. God protect our country."

In no phase of his residence to the Nazis was the caliber of the man more clearly revealed than in his stand on anti-Semitism. Despite the pressures of the German, King Christian refused to promulgate Hitler's anti-Jewish laws. As a matter of fact, he threatened that if such legislation were passed, he, and all the members of the royal family, would wear the yellow Star of David. Shortly thereafter, he attended a special service in a Copenhagen synagogue in full dress uniform. One story, in particular, points up the greatness of Christian's moral code. The German came to him demanding that something be done about the "Jewish problem." The King answered, "Sirs, we have no such problem here, because we have never considered ourselves inferior to the Jews."

It was this man, Christian X, with his love of freedom, his respect for human rights, his devotion to God, who was able to lead his people through five years of suffering and terror. It was due largely to him that the spirit of the Danes remained unbroken. With his passing, they have lost a good friend and a wise statesman. The world has lost a great Christian.

It is said that the King's last words were, "My task on this earth is over. I have peace with my God and myself. I am so tired."

May his soul rest with God.

From National Committee of Christians and Jews— by Maeanna Cheserton Mangle.)

"According to the Communists, the only solution to the labor problem is to toss the boss out, and let the workers run the Plant. "This . . . . idea certainly makes no sense in the America of 1947. Modern, high-speed, mass-production economy cannot operate, much less maintain high living standards, without cooperation among all groups—workers, farmers, businessmen, government." — Stuart Chase.

Vets Say Southern Postmasters Fail To Give Out Forms

New York, N. Y.—(Global)—Postmaster General Robert E. Hannegan received a protest last week from delegates to the first constitutional convention of the United Negro and Allied Veterans of America, who accused Southern postmasters of failing to deliver application forms for terminal leave to Negro vets.

Howard Johnson, vice-Commander of New York, who made the report in the fraternal clubhouse, 110 West Forty-eighth Street, told several hundred delegates representing Negro veterans in thirty states that $250,000,000 in army pay has accrued for 750,000 veterans in the South who have failed to file claims.

Because of the postmasters' actions, Mr. Johnson said, only two per cent of the Negro veterans were aware of their rights or had the facilities for making application.

He told his audience that a recent survey showed that many of these veterans had been denied "these application forms by the postmasters."

A protest was also sent to Attorney General Tom Clark against the denial of civil rights to many Negro veterans. This was based on a report of a recent murder in Camp Hill, Alabama. The details of this case were given the Convention by Arthur C. Price, Jr., special projects director of the Southern Youth (Negro) Congress, with headquarters in Birmingham, Ala.

THE FRIENDSHIP SHOWER

By FLORENCE J. JOHNSON

The girls were there and Joyce had greeted them. Now she was ready to tell them about the wonderful idea she had talked over long trip. It was just a farewell party with little gifts for her to remember them by, and would be useful on the trip. Then I remembered the new girl who just started to school here. She has come to live with her aunt and uncle, and she looked lonesome. So why not a friendship shower for her? We can have a little party with eats and games, and each of us can give her a present, something nice to have, or it might be a useful gift."

"Now that is something," exclaimed Doris. "Then she can get to really know us. Her name is so cute. It is Leta May Kennedy."

"Mother said we could have the party here on the sun porch, and we can have ice cream and cake, just like a birthday party."

"What shall we give for presents?" asked Betty.

"They mustn't be expensive. Just some little thing. The main idea of the party is to get acquainted."

"They have some nice pencil boxes at the store," suggested Alice.

"I saw some real pretty hair ribbon yesterday," said Doris thoughtfully.

"There was a pretty little picture with a poem about friendship in a gift shop," said Betty slowly.

On the very next Saturday afternoon they had the party. And Leta May was soon talking happily with her new friends and playing games. And she was thrilled and excited with the presents beside her place at the table.

There was a picture from Betty, a ribbon bow from Doris, a pencil box from Alice, a color book and crayons from Mary, a storybook from Jean, two pretty handkerchiefs from Nancy, and a little sewing basket from Joyce.

"This has been just the nicest kind of a party," Leta May said when the ice cream and cake were all gone and it was time to go home.

"I'm going to write to my cousin and tell her all about this party. A girl moved into our old home, and a friendship shower will be just the thing for my playmates to give her so they can get acquainted."

AMERICA'S NUMBER ONE POSTWAR PROBLEM

By Fred Leven, Jr.

Instructor Economics and Rural Sociology, Tuskegee Institute, Tuskegee, Alabama

The inevitable mechanization of Southern agriculture has produced very little effect on the population as a whole. According to Agriculture Department estimates, five million farm workers will be replaced by mechanical cotton pickers and other modern equipment in the South during the next five years. In this group will be farm tenants, share-croppers and farm laborers, Negroes and whites.

The increase of mechanization in Southern agriculture will likely result in even greater social changes than it has in other parts of the country.

Chief rivals of Southern farm labor, are tractors, machine cotton pickers, mechanical peanut and potato diggers, corn pickers, bean pickers, combines and two row planters, which leave only the dropping of plants to manual labor will speed worker displacement.

Farm machinery industry reports show that 2,000 new tractors are arriving on Southern farms each month. From 1940 to 1945, only a few Southern States failed to show near 100 per cent increases in the number of tractors on farms. 1. The percentage increase of tractors was greater for the Southern States than for the nation from 1930 to 1940 and from 1940 to 1945.

The bulk of the Negro population is concentrated in the South, since the South is primarily rural more Negroes are engaged in Agriculture than any other occupation. Over half of the Negroes engaged in agriculture are share croppers; therefore mechanization will have a greater effect on Negro farm workers than it will on white farm workers. The Negro may become permanently unemployed as a result of farm mechanization.

Demonstrations have already proved that a mechanical cotton picker can do the work of 40 workers. Although the new machines have not appeared on a large scale in the South, an excellent forecast is given by the effect of tractors and flame cultivators, which have already displaced many farm workers.

Recent improvements in ginning equipment make more feasible the expanded use of mechanical pickers and strippers.

The cost of picking with machines is less than half the price paid to hand laborers. These pickers get about 90 per cent of all the open cotton, they do not injure the boll. It can pick about six acres a day. Experiments have shown, that cotton can be harvested by mechanical pickers cheaper than it could be picked by hand.*

The migration of displaced Southern farmers is going to be a tremendous test of the basic humanity, democracy and understanding of farm and labor groups alike.

Joseph Albright, a special assistant to General Omar N. Bradley, Veterans' Administration, predicts a great influx of Negro and white sharecroppers into heavily industrialized areas of the country in the next few years because of displacement, by mechanical cotton pickers in the South.

The Negro's outlook for the next decade, he says, "is not good." He will be forced into already overcrowded industrial areas where, being largely unskilled, he can earn only a meager living. Areas where he would find more favorable conditions and racial relations do not offer sufficient job opportunities.2

The bulk of the Negro movement will be toward the following cities: Los Angeles, San Francisco, Chicago, and Detroit. These cities are the favorite migration points of the Negro when he leaves the South. Southern labor migrants will encounter the problem of terrific housing shortage in these cities, thereby increasing racial friction.

Both the territorial and occupational mobility of the Negro workers tend to be less than for white workers. The limitations to territorial mobility arise out of the rigors of the Northern winters and also the social resistance of the Northern whites. The Negro is handicapped in making occupational shifts, both by his own lack of education and by social barriers. The unemployed Negro laborer may prove an exception to the rule that in the long run there can be no technological unemployment.3.

These unfortunate Southern people will offer economic competition to both groups. Accustomed to a bare subsistence, they may be willing to take farm leases or make farm labor contracts below the standards of the states into which they migrate. They may also offer laboring people competition in terms of wages, in both instances. there is danger that they will be met with force, intimidation and violence rather than understanding and helpful assistance.

These people will be unfortunate, cast off by the reorganization of Southern agriculture and forced to migrate by conditions beyond their control, including our failure as a nation to guide Southern adjustment to meet or ameliorate the situation. 4.

They will need education assistance to adjust to the standards of their new homes. They will need assistance in re-establishing themselves 5.

According to Nat Caldwell, student of Southern economics, "for white millions pushed off the farms a possible rapid industrialization in the South offers great hope for absorption in their own region." 6.

Negroes migrating to Southern cities will encounter racial discrimination in securing employment.

STOP GAP

A possible stop gap solution in mass employment is the program of the National Farm Labor Union.

They are working out a system of seasonal employment which carries workers to plantations, truck farms and fruit orchards, all over the country. Union officials estimate that 80 per cent of such transferred labor returns to the South between seasons. The effect that such a large scale migrant labor policy will have on family life is not promising however. The union is attempting another solution in cooperative farms is undeveloped Western areas, but they estimate that only half of the displaced labor can be absorbed there. Cities are expected to absorb the rest.

OTHER PROBABLE SOLUTIONS TO THE PROBLEM

1. The development of cooperative farms. It will be very necessary for small farm owners to purchase their farm machinery as a group, and farm cooperatively; otherwise they will not be able to market their products in competition with the mechanical pickers and other farm labor saving devices.
2. Adjustment of cotton acreage, diversification of crops and encouragement of industry, as proposed by the Bureau of Agricultural Economics.
3. Encouraging large size farm units.
4. Encouraging farm ownership.
5. Encouraging all farmers that can qualify to seek the services of the Farmers Home Administration.
6. Revamping our educational program on both secondary and college levels.

Since some of our secondary schools offer training only in vocational Agriculture, trade courses should be introduced into the curricula. On the College level our trade departments should be expanded to meet the needs of the students who are forced to seek employment in non-agricultural industries.

I am not implying that Agriculture should be discontinued entirely but only those who are contemplating farm ownership, or planning to seek an Administrative position in Agriculture should be encouraged to enter the field.

According to a statement by T. C. Owensby, veterans' Agricultural training officer for the Columbus, Georgia District, veterans are finding it difficult to obtain farm loans under the G. I. Bill of Rights because "bankers say that the money lent to a veteran is tied up too long a time at too low an interest rate." 7

Under the G. I. Bill, Government guaranteed farm realty loans may be extended for 40 years at four percent interest rate.

Unless a solution is found to the above situation, veterans who anti-

cipate becoming farm owners will be forced to seek employment in non-agricultural pursuits. Since farm ownership is vitally important for the veteran to begin at the bottom of the agricultural ladder and work to the top.

Farm mechanization is not a problem for the South alone, it constitutes a challenge to the nation.

Since we should deal with this matter as a nation, I am hoping that a national program to meet the situation is adopted in the very near future.

SUMMARY

An average time schedule for the change over of 60 per cent of the South's crop production to machinery; from estimates by 10 leading agricultural engineers is 10 years.

Many leaders. Negro and white, feel that mechanized farming will be a blessing to the Southern Negro.

Most base their opinions on destruction of the near slave status of Negroes under the plantation-sharecropper system, which mechanization bids fair to eliminate.

It is becoming obvious that many of these displaced people will migrate out of the South into the North and West.

These displaced people will need education assistance. They will need assistance in re-establishing themselves. Displaced persons should be trained for non-farm employment.

A plan proposed by the Bureau of Aricultural Economics for a reoljustment in the south, adjustment of cotton acreage, diversification of crops, more family type farms and encouragement of industry should be given serious consideration.

A possible rapid industrialization in the South offers great hope for the absorption of white displaced workers.

For the good of the nation as a whole, an intelligent program to meet the situation should be adopted in the very near future.

Colored County Agents Study Better Methods of Aiding Farmers

Better methods of getting farm and home demonstrations across to farm people are being emphasized in county agents workshops, say reports received by the U. S. Department of Agriculture from State Extension Directors.

The reports indicate that Statewide agents workshops have already been conducted by Negro State Extension supervisors in Maryland, West Virginia, and Virginia. These workshops were patterned after the South-wide Extension supervisors workshop held at Southern University last fall.

The county agents workshops have been considering such problems as developing effective programs, making an annual plan of work, establishing in-service training and leadership training procedures, and employing information techniques to improve their press releases and monthly reports.

It is pointed out that there are more than 800 colored agricultural extension workers employed throught the South to serve colored farmers. Through demonstrations, these workers help farm people improve their homes and their farms. Considerable emphasis now is being placed on demonstrations which point up the desirability of growing more sideline and substitute crops in the cotton region to help conserve the soil and raise the general standard of living.

Increased Wage Rates Announced For Sugar Beet Workers

The U. S. Department of Agriculture has announced minimum wage rates to be paid sugar beet workers this year by producers who apply for payment under the Sugar Act of 1937 as amended.

The minimum piece-work rates specified in the wage determination average about $3.20 per acre, or 7.8 per cent above the average of the 1946 rates for the 12 wage districts into which the sugar beet producing area is divided. In most wage districts, the increase is divided between cultivation and harvest work in the proportions of about one-third and two-thirds respectively.

Minimum time rates for all districts are established at 60 cents per hour for blocking, thinning, hoeing, or weeding; and 65 cents per hour is set for pulling and topping. As in previous determinations, piece rates may be reduced in cases where labor saving methods are employed. If higher rates are agreed upon, payment of such higher rates is required.

Department officials point out that the wage increase will give to labor a share in the higher prices which sugar beet producers are guaranteed for their 1947 crop. As previously announced, producers are assured a national average price of $14.50 per ton of average quality sugar beets.

The Sugar Act requires, among other conditions of payment to growers, that all persons employed on a farm in the production, cultivation, or harvesting of sugar beets be paid in full at rates not less than those "determined to be fair and reasonable" by the Secretary of Agriculture.

Income From Woodland Equals That From Cattle

Income from farm woodlands that are carefully and intelligently managed is often as high as that from cultivated crops, pastures, meadows, and orchards, says John W. Keller, assistant chief of the Soil Conservation Service's forestry division.

Writing in the April issue of SOIL CONSERVATION, a U. S. Department of Agriculture publication, Mr. Keller says that southern pines planted in experimental areas of the Alabama Agricultural Experiment Station have yielded excellent returns. For example, slash pine 12 years old $14 per acre per year; slash pine 17 years ild, $12; and loblolly pine 20 years old, $20 per acre per year.

Gross returns from beef cattle production in Alabama during the 1943-45 period, says Mr. Keller, ranged from $10.50 to $20 per acre per year.

Colored county agents report that increasingly colored farmers are adopting modern woodland management practices. Through select cutting, many of them are said to be upping the long-time income from their farm woodland by a wide margin.

Head of Sugar Rationing Counsel Resigns

Washington, D. C.— Charles Quick, general counsel of the Sugar Rationing Administration, U. S. Department of Agrciulture, has resigned effective May 16 to enter private practice of Law in Cleveland, Ohio, the agency announced recently.

Mr. Quick, who was formerly assistant general counsel of the Office of Price Administration, came to OPA in December 1942 from the Law School faculty of North Carolina State College for Negroes in Durham, N. C. He became general counsel of SRA when the sugar rationing functions of OPA were transferred by Congressional Act to the Department of Agriculture.

He is a graduate of Talledega College and Harvard Law School; is married and has two children.

With Tennessee Home Makers

By HELEN CULLENS

District Home Demonstration Agt.

The Strawberry is one of the most popular and well-liked berries or fruits that we have. It is unusual to find a person who does not like strawberries; and so very often you hear someone saying that he "has never had his fill of strawberries." Since it is so popular, it is strange that every person who has a garden does not have strawberries growing. Even a small patch can be of much pleasure to the family. It is good, eaten by itself, in creams and deserts, in jams, or frozen.

So—if you have space in your garden, why not develop part of the area to strawberries?

There are several varieties which grow well in Tennessee. Some varieties need to be thinned more often than others and are more susceptible to a yellow-leaf disease. Some varieties are better for preserving than others. Some varieties differ as to flavor and are larger. Everbearing varieties are not generally satisfactory; they are recommended only for expert growers having water for irrigation.

Very early spring planting gives the best results. Early March will do. Plants must be set tightly in the soil, with the roots spread out. If the soil is very loose, there will be danger of pushing them too deeply or setting them so that rains later wash soil from the roots. The growing point must not be covered, nor the roots exposed.

Frequent cultivations are necessary. As runners form, the cultivator should be kept farther from the row so the plants may take root. At the end of the season a matted row of plants 2-feet wide may be expected if weather conditions and care have been suitable. If you want a strawberry crop to be successful, you must expect to do a great deal of hand work—and this includes weed pulling as well as hoeing.

Another point in the summer care of garden berries is the thinning out and spacing of runner plants. These plants will crowd each other in some spots and seem to avoid other spots. If the plants at the end of the season stand not closer than five inches, better fruit will be obtained. The necessary thinning to bring this about can be done best during the growing season, runners may be moved and held down with soil, so that plants will form in the right places.

Commercial berry growers in Tennessee find it profitable to provide a soil covering of straw in winter. This covering, or mulch, is applied in November and December and consists of a thin layer of clean straw or pine needles. It should cover the entire surface evenly but not be so thick that you cannot see the soil and foliage beneath; this would be too thick for the plants to push through in the spring.

The only things that should limit the life of a berry planting are diseases and insects. Weeds and grass often ruin commercial fields in two years, but this result is avoided in the garden by late cultivation and annual renewal of the rows.

The leaf spot of strawberries is a disease which is not readily controlled by spraying. If it becomes very severe, a new planting in a different place may be made. Crown borers, if present at all, will be apt to increase in number and kill so many plants that the rows may as well be abandoned.

The strawberry weevil is an insect that attacks the stems of the blossom buds, causing the buds to dry up and fall. A dust mixture consisting of one pound of calcium arsenate and three pounds of hydrated lime will reduce the injury, if it is applied twice while buds are opening.

Even with all hazards—and they aren't so many—strawberry growing is not too difficult and provides a very-much welcomed product. One 4-H Club girl who had one plant picked 26 gallons of berries from the descendants of that one plant three years later. A small start with strawberries can grow into a big business.

Agricultural Agents Help Negro Miners Grow Own Food

Colored agricultural extension agents in West Virginia are helping Negro mining families in that State to produce more of their own food at home, reports L. A. Toney of the West Virginia State Extension Service.

Although good land is scarce in the mining area, by encouraging families to develop backyard plots, many mining families now are growing a considerable part of their food supply, according to a survey conducted recently by the West Virginia State Extension Service.

Last year 9,000 rural and mining families in the State grew gardens. This represented an increase of nearly 2,000 over 1945. The survey also showed that many mining families raised hogs, chickens, turkeys, and rabbits. From their home-grown food supply, they canned 281,291 quarts of fruits, vegetables, and meats.

Green Manure Sure, Easy Method of Fertilizing Soil

By DR. FLOYD BRALLIAR

Tennessean Garden Editor

One of the surest and easiest ways of fertilizing the soil, and especially of getting it well filled with humus, is to grow and turn under crops for green manure.

The vegetable gardener and the flower gardener should both plan to turn under one green crop every year if possible. And it is possible if one is wililng to grow a crop that will mature quickly and will plant just small areas at a time.

The illustrate: One may not intend to plant his entire garden till May or even later. Let him plant the part that he wishes to have in early vegetables as usual, but at the same time he may sow the parts of his garden he is not planting early with peas, with ordinary wheat, with Norfolk kale, or with any number of other rapid growing plants that would come up in less than a week and will cover the ground five or six inches deep with green growth by the time he wishes to turn it under and plant his later crops. Even though the plot we have to use in this way is no more than 10 feet square, it will pay to grow a green crop and turn it under.

One should always turn this green manure under at least a week or 10 days before he plants the soil. This would give it time to start decaying before the new seed has started growing.

Then when the early garden peas and the first early beans have matured, spade them under as a green manure. The same thing is true of a lettuce bed, an early mustard bed, and other early maturing crops. Later in the season you can usually find a chance to repeat this on other parts of the garden and will often have fertilized the entire garden in this way before the summer is over.

Some will hesitate to do this because they have the idea it will take a long time for the green manure to decompose. We quote from Farmers' BULLETIN No. 1750 on this point: "A green-manure crop decomposes most readily in hot weather and when combined with moist soil. In warm weather with moisture present, almost complete decomposition may take place in less than six weeks. Young, succulent material decomposes much more readily than older or mature plants.

"Fertility liberated in the process of decomposition should be utilized by growing plants, or it will be lost by leaching or escaping into the air in the form of gas.

"These facts should be kept in mind in utilizing green-manure and cover crops or any kind of crop residue."

In turning under green manure if the soil is very sandy, it is best to turn it under only two or three inches deep, for as it decays it will leach out; but in heavy clay soil it may well be turned under full spade deep. And no matter how deep it was turned under it should always be mixed well with the soil. This means that care should be taken not to leave the green manure material in bunches or layers where it will not decompose rapidly. It is better not to turn under more than five or six inches of green material if the soil is to be replanted sooner than three weeks after the green matter is turned under, because large quantities of undecomposed material would tend to make the surface soil dry and so produce a poor seed bed. However, if there is plenty of moisture in the ground, as is almost sure to be before the middle of June, this will not occur.

Of course any kind of legume crop is to be preferred for this purpose because it will not only supply humus but will supply considerable quantities of nitrogen to the soil. However, if we desire something that will produce a green crop of manure very quickly, we know nothing superior to Soudan grass. Within five or six weeks from the time the seed is sown, especially if the weather is hot and the soil moist, Soudan grass will produce a heavy crop from 12 to 18 inches high, about as tall a crop as we ever like to turn under in the garden, and Soudan grass contains more nitrates than any other manure grass with which we are acquainted. Do not be afraid to use Soudan grass, for even though it looks almost exactly like Johnson grass it is strictly an annual and never becomes a pest.

Buckwheat is another very rapid growing crop that is excellent for this purpose, especially for use on tough hard clay soil. We do not know just why but there is something about buckwheat that reduces the toughest soil to an open, loose condition very quickly. If sown after the ground becomes warm, it will be ready to turn under in five or six weeks and will decay in another five or six weeks.

No matter whether we have turned a green crop under at sometime during the summer or not our soil here in the south should always be planted to a cover crop of some kind for the winter to prevent washing and leaching of the soil.

Coal and the Future

The importance of coal to this country has increased, not decreased, despite the development of competing fuels. And the role of coal as a source of fuel and energy in the future will in all likelihood be magnified many times.

Mechanical Engineering recently carried a significant technical paper on our national fuel reserves, by an official of the U. S. Bureau of Mines. This paper stated that coal and lignite comprise 98.8 per cent of the national mineral fuel energy reserves, excluding fissionable materials, and said: "It is evident . . . that ample supplies of coal are available for the production of the necessary requirements of gaseous and liquid fuels when the natural gas and petroleum reserves . . . need to be supplemented from other sources. . . . It is quite reasonable . . . .to assume that plenty of gaseous and liquid fuels will be available in the future for many years, probably a thousand years."

New and revolutionary techniques are now being developed to vastly increase the potentialities of our almost endless coal deposits. Refineries for producing motor fuel from coal are now in the experimental stage, and great success has already been attained. The cost is not much above that of gasoline produced from oil, and will undoubtedly be reduced. Experimental work is likewise going on to make possible the transportation of powdered coal by pipeline from the mining regions.

Coal remains the cornerstone of the great American industrial machine with its insatiable demand for power in all its forms. And science is making the most of this invaluable natural resource.

Whole Family Grows Calves

William Houser, Mount Sinai Community, Autauga County, has been a 4-H Club boy for six years. During this time he has carried several crop and livestock projects, and has been president of his community 4-H Club for two years.

In 1945 the county agent asked William if he would like to raise a calf for the fat calf show. As a result, William asked his father to lend him $39 to buy a calf. That same year William grew 22 bushels of corn and one ton of velvet beans for feed.

At the fat calf show, William's calf sold for $210. That same year he bought another calf for $68. It brought $257 at the show and sale last April.

William's success with calf projects made his three brothers and sister want calves. Each of them is showing a calf in Montgomery Fat Calf Show this month.

Eating Habits Change

A comparative study of eating habits before and since the war shows that the American people are eating more meat, poultry, and fish, more vegetables and fruits, more eggs and dairy products, except butter, reports the Bureau of Agricultural Economics of the U. S. Department of Agriculture

But, according to BAE, the American people are consuming less grain products, sugar, syrup, fats and oils; and about the same amount of potatoes, beans, cocoa, tea, and coffee.

Tobacco Farmers Have Larger Market

Increased cigarette consumption by old smokers together with the addition of a considerable number of new smokers has enlarged farmers' tobacco market, says the Bureau of Agricultural Economics of the U. S. Department of Agriculture. During the last five years, a trillion-and-a-half cigarettes have been manufactured in this country. End to end those cigarettes would belt the earth 2,500 times. During the last three years tobacco farmers have increased their acreage by about 50 percent, reports BAE.

Plentiful Foods

To the list of plentiful foods for May, marketing specialists of the U. S. Department of Agriculture announce four additions—canned peas, and tomato juice, cottage cheese and sauerkraut.

Foods already listed on the plentiful list for May are potatoes, citrus fruits—oranges, grapefruit, and canned citrus juices—dried peaches, small-sized prunes, eggs, peanut butter, and heavy tom turkeys.

SURVEY MADE BY JOHN W. MITCHELL, FIELD AGENT EXTENSION SERVICE, U. S. D. A.

The data below was secured from a survey made of the agricultural enrollment in the two private Negro institutions and seventeen Negro Land Grant Colleges teaching agriculture in the South. Alphabets are used for identification instead of names.

The Byrd Nest

(Continued from page 1)

to remind you that often a deadly poison is hiding behind a smile. A man once thought his enemy was the person who spoke roughly to him; and yet, tender words may be tones of trickery to tear in bits our security and pleasure. Your foe knows how to disguise; Stop the Enemy.

Jesus instructed us to pray for our enemies and to love them. He meant for us to do these things to prevent our becoming enemies to our enemies. He so advised us, also, that we might through prayer turn our enemies into the hands of God who is able to watch the maneuvers of our enemies and to stop their every thrust.

Despite the fact that we are to pray, he did not intend that we should throw ourselves into the path of our enemies. Neither did he intend for us to sit quietly and allow our enemies to hand-cuff us. We are told to pray and yet to shun the presence of evil. We are told to love, and yet to watch. Jesus did not fight his enemies with their implement of war. He routed them with the truth and escaped their fury with invisibility. If we would stop our enemies, we must be true to ourselves, our friends, and to all we know. We must be wise enough to make some moves invisible. Let us stop the enemy by first stopping our folly and vanity. Let us get rid of our enemies by getting rid of our own suicidal ideals, opinions, and practices. If I can't stop myself, I cant' stop the enemy.

Teachers Urged to

(Continued from page 1)

It points out that some schools may wish to rearrange the equipment in the school kitchen in order to facilitate the preparation of lunches; others may wish to install additional equipment in order to reduce labor costs.

Also the editorial suggests that during these last few weeks of school, teachers and parents will want to check the fixturs to see that they are in good repair, the garbage containers to see that they are flyproof, and the lighting to see that it is adequate.

The School Lunch Program became permanent last June when the Congress so authorized it. This makes it possible now for schools to plan a long-range program. It is estimated that nearly 8,000,000 white and colored youngsters are participating in the program this year.

Broadcasts, Tours Highlight Home Demonstration Week

Broadcasts, tours, and home improvement programs highlighted the observance of National Home Demonstration Week by colored farm women and home agents, May 4-11, according to reports received by the U. S. Department of Agriculture from State Extension supervisors.

Colored agents and homemakers participated in Broadcasts in Oklahoma, Alabama, Mississippi, Louisiana, and Texas. In Mississippi, Miss Alice C. Oliver State supervisor, discussed the need for better rural housing over Section WCBI in Columbus, Miss. and in Alabama. Miss M. F. Hyland, and Miss R. L. Rivers district agents described work of the home demonstration program in the State over Station WAPI Birmingham. They pointed out that 27,864 colored farm families in Alabama improved their home-grown food supply last year by enlarging their gardens and increasing their poultry, livestock, and milk cows.

So effective were the Mississippi home agents in mobilizing farm women to improve their homes during the observance that hardware stores in 16 counties sold out of ered 40 communities and involved screen wire. Tours in that state cov-2,833 homes. Both white and colored homemakers took part in the tours, reports the State supervisor. Florida and South Carolina conducted sewing machine and pressure cooker clinics. All agents and homemakers in all States took advantage of the observance to launch a membership campaign for their home demonstration clubs.

Dave Davidson,

(Continued from page 1)

Field Service Branch, becomes Assistant Administrator for Production. His responsibility for production activities will include agricultural conservation and adjustment programs, farm marketing quotas, farm labor supply, and other programs of PMA which involve direct dealings with farmers through the state and county farmer committees.

Davidson has operated his own farm in Tulare County, California, for many years, specializing in cotton, fruits, nuts, and beef cattle. He was elected a county Agricultural Adjustment Administration committeeman in 1933, became a member of the California State AAA Committee in 1938, and was appointed Director of the State PMA Office in 1945. He came to Washington in the spring of 1946 as Director of the Field Service Branch.

Claudius B. Hodges, who has been Deputy Director of the Field Service Bransh will now be associated with Davidson as Deputy Assistant Administrator for Production. A native of Texas, and operator of a farm there, Hodges has been on the staff of the Department of Agriculture for a number of years. From 1942 until 1946, he served as a food distribution administrator in the Texas State Office of the former Office of Supply. Hodges came to Washington in April, 1946, as Deputy Director of the Field Service Branch.

Carl C. Farrington, an Assistant Administrator under the former PMA staff structure, becomes the Assistant Administrator for Commodity Credit Corporation. In his new position, Farrington will be responsible for CCC operations and program finance activities related to loan, price support, foreign supply, domestic diversion and other activities.

A native of Oklahoma, Farrington first came to the Department of Agriculture in 1928 as a member of the staff of the Bureau of Agricultural Economics. He transferred to the Agricultural Adjustment Administration in 1934 later becoming Assistant Director of the AAA Western Division, and then Assistant to the AAA Administrator. Soon after the Commodity Credit Corporation was transferred to the Department of Agriculture in 1939, he was named a CCC Vice-President in charge of programs related to grain, cotton, rice, tobacco and other commodities. He continued in this service until appointed director of both the grain and the cotton branches of the PMA when this agency was established in August, 1945. In April, 1946 Farrington was named an Assistant Administrator of PMA.

The Secretary's March 19 order provides for a third PMA Assistant Administrator—the Assistant Administrator for Marketing. An appointment to this position will be made and announced in the near future.

The three Assistant Adminstrators will work directly with Administrator Jesse B. Gilmer and Deputy Administrator Ralph S. Trigg in the over-all direction and integration of PMA's programs and services.

USDA to Support Turkey Prices in Fall

The U. S. Department of Agriculture has announced a price-support program for 1947-crop turkeys marketed during the period October 1, 1947 through January 31, 1948. This action has been taken to assure white and colored farmers price support on a nation-wide scale this year throughout the normal season of turkey marketing.

Suggestions Given For Transplanting Wild Flowers

Many native American wild flowers deserve cultivation by home gardeners. "Cinderellas of the woods often change into princesses when brought into proper cultivation," say plant scientists. Wild flowers may be poorly shaped or sparse blooming only because they are struggling to survive on poor soil or under crowded conditions. Transplanted to a more favorable location on home grounds, they often become surprisingly beautiful.

Success in growing wild flowers requires knowledge of their habits and needs, however. Loss and disappointment is generally the result of digging up and setting out carelessly. Before transplanting from the wild, the gardner should note the soil and situation in which the wild plants grow. He should notice the fertility, moisture and type of soil to make sure he can provide the same on his home grounds. He should also notice whether the plants grow in sun, shade or both before moving them.

The season of transplanting also may be important for success. Plants with fibrous roots that grow near the surface of the ground may be transplanted at any time. Those with sparsely branched roots that go deeply into the soil are more difficult to move successfully. In the South these generally should be moved in the fall and winter. Bulbous plants generally are transplanted, more suceessfully after the blooming season when their foliage begins to turn yellow.

If plants are moved during the blooming season, the scientists recommend cutting the tops off a few inches above ground so that the plant will not need so much water until the roots are reestablished. As much soil as possible should be left around roots when transplanting.

Corn Cob Treatment Makes Bearings Roll

Philadelphia— (AP) —The lowly corn cob, once a worthless farm by-product that couldn't even be fed to a hog, is now a valuable industrial material.

So important are corn cobs to the manufacture of precision ball and roller bearings that SKF Industries uses more than 48,000 pounds of them a year.

The reason is that corn cobs when finely ground, have high absorbent qualities and are virtually free of acids that cause rust on highly polished steel. Balls, rollers and components of bearings are dropped into revolving barrels full of ground corn cobs for drying, cleaning and polishing.

Investigate Before Buying New Home, FHA Officials Urge

Persons in the market for homes were urged today by State FHA officials to investigate before buying, no matter how urgent the need.

B. W. Horner, state director of the Federal Housing Administration in Memphis, points out that buying or building a home is perhaps the largest investment a family ever undertakes, and extreme care should be taken in selecting a home in view of the current housing situation. He added that many persons make poor home investments by rushing into transactions without proper investigation before hand.

Horner states that FHA provides this investigative service for applicants of FHA-insured mortgages to finance home purchases. The five major aspects which are carefully considered are:

Structure and lot on which the mortgage is placed; the neighborhood in which property is located; relation of the property to the neighborhood; the borrower and his relationship to the transaction, and the terms of the proposed transaction.

Lauderdale County Family Makes Good Living on Farm

John T. Bulls' 203-acre farm in Lauderdale County, Alabama, has paid off because of his wise use of family labor and his good soil building program.

Bulls and his wife reared and educated ten children. Two of them are at home now helping with the farm work. The others are leading successful lives in other professions.

In 1940 Bulls became a test-demonstration farmer with the Extension Service and Tennessee Valley Authority. He began working cover crops, pastures, and livestock into his farm plans. A few years ago, his farm brought income from cotton and corn. Now he has income from cotton, corn, wheat, hay, grains, steers, poultry and eggs, turkeys, truck and fruit crops, and hogs. Terraces and good pasture, the use of legumes, and grain crops helped him keep the soil from washing away.

Seven years ago, he produced only 16 bales of cotton on 65 acres of land. He was sure that something was wrong. After much thought and study, he realized that his land had been overworked, and was even more tired than he.

After Bulls was approved as a test demonstration farmer, he began building up his land. He used large application of lime and TVA triple superphosphate and seeded legumes, small grain and pasture mixtures. He is gradually building into a pasture and live stock program.

In six years, the number of cattle has gone from three to 25 head. He now has two fine yearlings raised from his herd that will be shown at beef calf shows this year. Where he once only produced pork for home use, he now has 15 hogs on pasture, of rye grass and crimson clover.

Bulls is turning much of his sloping land into pastures. He has 12 to 15 acres of permanent pasture for his stock in addition to more than 100 acres of winter grazing or small grain and winter legumes Thirty acres in cotton last year produced almost a bale to the acre. Forty acres of land which ten years ago produced only a few sacks of nubbins grew nearly 1300 bushels of corn. Thirty-five acres of wheat produced 1400 bushels.

Bulls says he has been farming all of his life. He got his present farm more than 20 years ago and started working hard to get ahead.

"I stay at home" he adds. "A lot of folks have too much business in town to do any good on the farm. Most of my boys stick pretty close, too. There's lots to do on a farm and we try to keep up with it. I don't tell the boys what to do. I say 'let's go, boys, and get at it together.'"

By working hard and saving, Bulls built a ten room house, bought more land as he needed it and educated his children.

The farm isn't at the top yet, but it is on the way and is pointing the way for a number of other farms in the community.

Cotton Production in '46 Lowest in 25 Years

Th 1946 U. S. Cotton crop amounted to only 8,640,000 bales, the smallest since 1896 except for 1921, according to the Crop Reporting Board of the U. S. Department of Agriculture. This estimate is based on final ginnings as reported by the Bureau of the Census.

Total consumption of cotton in foreign countries during 1946-47 is expected to exceed the 1945-46 rate by about 2 million bals and it is estimated that world consumption will be about 26 million bales. World carry-over August 1, 1947 is now estimated at slightly over 16 million bales, about a million bales less than the 1935-39 average.

Consumption is running lower in a number of European countries than was estimated earlier, primarily because of limited power and fuel supplies. Limited foreign exchange in Spain and Poland, by preventing purchases of sufficient raw cotton, has kept mill output at a very low level. In the Far East, Indian mills are using about three-fourth as much cotton as in 1945-46, primarily because of strikes of textile workers. Cotton consumption in China this year is expected to be almost 2 1-2 times that of last year.

PRACTICAL LOVE

By A. B. SMITH

Kansas City, Mo.—Love is said to be the greatest force on earth, yet it is often left out of our lives entirely or only partially exercised. Lack of love creates selfishness, dissension and strife. When we trully love a person we desire to make him happy. We find joy in his pleasure,overlooking many blemishes, because our love transcends the natural.

The Apostle Paul tells us that the first fruits of the spirit is love. When God dwells in our hearts, we bear this fruit. If we bear not love we know not God, for God is love. Jesus emphasized the great commandment and commended it to us: Thou shalt love the Lord thy God with all thy heart, soul, might, strength, and mind. This is a practical love employing the three important faculties of our being. To leave out any one of them in our love toward God makes us unsatisfactory Christians. The heart is a symbol of our emotions. God is intelligence on a super scale. Therefore he demands an intelligent love from us. His infinite wisdom is a great challenge to us as an intelligent people to love God not only with our heart but with soul and mind. Love is not only practical but enduring throughout a human life.

Sinclair Lewis' New Novel "Kingsblood Royal" Exposes Racial Bigotry and Hates

New York, May 23— A violent storm of controversy is expected to rage around Sinclair Lewis' latest novel, "Kingsblood Royal," just published. Letting the chips fall where they may, sparing nobody's feelings in his desire to get at the truth, Lewis' "Kingblood Royal" is a ruthless expose of racial prejudice— American style. (Random House, $3.00).

Neil Kingsblood is a young midwesterner, a veteran, who discovers he is one thirty-second Negro. He could have kept the fact a secret—even from his wife and child —and maintained his "position" in upper middle-class society. But his conscience drives him into an investigation of the Negro world, and ultimately to full disclosure of his "secret."

Overnight young Kingsblood's own world changes. Once secure and respected in the "restricted" community in which he has been living, he now finds himself branded an imposter. He and his family become the target for race-baiters, many of them his former "friends," and they are hounded day and night. In his hour of bitter trial Neil Kingsblood learns a lesson he had failed to learn during the war—a lesson in democracy. He comes to understand what constitutes real and sham Americans—a difference that does not lie in the color of a man's skin.

The descriptions of Negro life by one of America's most famous authors ("It Can't Happen Here," "Elmer Gantry," "Babbit," etc.) are among the most penetrating and sympathetic of such studies ever written by a white man. While in "Kingsblood Royal" it would seem as if the forces of hatred and bigotry might win out, it is a temporary victory only. For the awakening of Kingsblood is a symbol of the future—that points the way to the salvation of all mankind. "Kingsblood Royal" is a Literary Guild Selection for June. —Released by Ben Hall Associates.

Fat Calf Show Helps Boost Interest in Growing Cattle

By J. R. Otis

The Montgomery Fat Calf Show is becoming an annual classic for Negro club boys and girls in Central Alabama. The show this year was held April 8-9.

The Chamber of Commerce, the Alabama Farm Bureau, the Livestock Associations, and the Union Stock Yards made this show possible for all club boys and girls in this area. Clubsters were entertained and prize money raised by those organizations. The club calves were sold to packing companies, merchants, institutions, and a wide range of business firms who wish to help these club boys and girls get a higher price for their calves.

This has greatly encouraged the clubsters. But the meat in the cocoanut of club shows and sales is the ability of club boys and girls to buy their calves right, feed them home-produced feed, and make a profit when they are sold at market prices. To do this, livestock breeders must make it easy for club members to buy calves at mark et prices so that they can be fed out and sold at market prices.

If the business of livestock production is to remain on a sound basis, club members should expect to reap only fair profits from feeding-out and showing their calves. Such profits will come from selling the calf at a higher market grade than it was bought for. Fat on the carcass produced by proper feeding lifts an animal from "common" to "medium." A little more fat, if the animal is of the type that will carry it, makes him "good" and probably "choice" in market grades. "Prime grade" is the product of good type plus tops in the amount and distribution of fat. A prime steer is as nearly perfect as an animal can be.

There were 32 calves exhibited from 10 counties at the first Montgomery show in April, 1945. Only one calf graded choice, eight good, 12 medium, and 11 common. Twenty-eight per cent graded good and better. There were 130 club calves and one carlot exhibited from 17 counties at the Montgomery Show in 1946. Fourteen graded choice, 57 good, 45 medium, and 14 common. Fifty-four percent graded good and better. In 1947 there will be 27 counties showing.

The total sale value of club calves shown in 1945 was approximately $5,500. In 1946 it was $23,-229. In 1947 the sale value will amount to $55,000 if the average price in 1947 is about the same as that for 1946. Prize money and carlot sales were not counted in the figures for 1946 and the estimate for 1947. One carlot of steers was shown in 1946; 10 will be shown in 1947.

In 1945 shows were held at Mont gomery and Tuskegee; in 1946, at Montgomery, Tuskegee, and Demopolis. In 1947 there will be shows at Montgomery. Tuskegee, Demopolis, and Decatur.

AVC Appeals For Funds To Wipe Out Deficit of $25,000

NEW YORK—The American Veterans Committee, progressive organization of veterans of World War II, is making an appeal to its members and friends for contributions to help wipe out a deficit of $25,-000 by time the annual convention is held in Milwaukee, Wisconsin this year.

AVC draws no color line and seeks to have all veterans in the same posts in every city. It plans to hold all future annual conventions only in such cities as will provide equal accomodations for veterans, regardless of race.

In the letter appealing for funds to wipe out its deficit, Charles G. Bolte, the national chairman, points out that AVC has grown from a membership of only 12,000 on January 1, 1946, to a total of more than 100,000 veterans and that this growth has been made "despite the worst defeat American progressiveism has suffered in twenty years." Further, the letter states:

"This growth has had its cost. Since beginning we have depended on friends of AVC for financial help. We are not yet self-supporting. That day will come when we will have an enrolled membership of 200,000. That we are powerful and effective, however, even the Rankins will tstify."

"It has cost us approximately thirty-three and a third cents a member over and above our income to build AVC to its present strength. I urge you to give generously to AVC to help wipe out our debt before the installation of the new administration at the Milwaukee convention. Your gift of dollars will be your expression of faith in AVC's future."

Executive offices of AVC are located at 1860 Broadway, New York 23, N. Y. Vernan A. Eagle is the national treasurer.

AVC's slogan is: "To achieve a More Democratic and Prosperous America and a More Stable World."

1,791 Enroll In Summer School At Atlanta University

Atlanta, Georgia, June 17.—Special—Seventeen hundred ninety-one men and women are taking the 209 graduate and undergraduate courses at the Atlanta University Summer School, President Rufus E. Clement announced this week. This year's enrollment is an increase of approximately 300 over the figure for 1946. Nine hundred and ninety-nine are enrolled in the graduate professional schools and 792 are in the college division. Approximately 484 of this number are veterans. In addition there are 79 pupils in the progressive education demonstration school.

The faculty of more than 100 includes instructors selected from the Atlanta colleges and a visiting faculty including in dramatics, Dr. Anne M. Cooke of Howard University; political science, Dr. Albert Leonis Turner, dean of the law school, No. Carolina College; English, Professor George Morton of Dillard University; sociology, Dr. Edward Nelson Palmer of Fisk University; and education, Mr. James C. Reese, principal of Center High School, Waycross, Georgia; and Mr. Charles E. Stewart, principal of Douglas High School, Thomasville, Georgia.

Among the special features at the Summer School are the following workshops: Science, conducted by Mr. William N. Jackson, of the faculty of Lincoln-Grant School, Covington, Kentucky; Guidance and Counselling, under the supervision of Miss Alma L. Stegall, acting consultant of Georgia Negro elementary schools; Health Education, supervised by Dr. Juanita G. Pierce of Atlanta University's School of Education; Language Arts, conducted by Mrs. Lucy C. Grigsby of the department of English, Atlanta University; Arts and Crafts, under the joint supervision of Miss Leah N. Guthrie of Stowe Teachers College and Mr. Walter A. Simon of New York; and the Principals Workshop, conducted by Dean James B. McRae of Fayetteville State Teachers College.

The Summer School is a combined project of all of the Negro colleges of Atlanta under the leadership of Atlanta University. The sponsors are Atlanta University, Clark College, Morehouse College, Spelman College, Gammon Theological Seminary and Morris Brown College. Mr. J. P. Whittaker is director of the Summer Session.

WAX THE BLINDS

A coating of liquid wax applied to Venetian blinds will make them dust resistant. First wash the slats in mild soapsuds. wipe with a cloth wrung out in clear water, and dry thoroughly. Then apply liquid wax.

Random Hints on Produce

Selected from publications of the National Association of Retail Grocers, 360 N. Michigan Avenue, Chicago

Due to its rapid turnover, the inventory value of fresh fruits and vegetables is relatively low. One hundred dollars invested in produce, for example, can account for $10,000 in annual sales on a turnover of a hundred times a year. At 25 per cent gross profit, this would mean an annual gross of $2,500. A net of 5 per cent, or $500, would return 400 per cent on the original $100 investment.

There is no hard and fast rule, but experience has shown that 15 per cent of the selling space in the store can account for 30 per cent of the total store volume when devoted to produce. On the other hand if less than 10 per cent of the floor space is devoted to fruits and vegetables, it generally means restricted volume because displays are necessarily small.

Bookkeeping is an inherent part of selling fresh fruits and vegetables, and the lack of it is probably one of the chief reasons for the little interest in and knowledge of the produce department on the part of many store owners. The retailer who keeps a simple tabulation of his daily purchases, sales and losses, knows whether his produce sales are increasing, decreasing, or remaining stationary; he knows just how profitable or unprofitable his produce department is, and what percent of the total volume is coming from this department.

Produce suffers from much handling, of course, and it is well to remember that the less a customer has to dig and pull to reach the item she wants, the less damage both to the display and the merchandise. Therefore displays should be simple and convenient.

Variety in the produce department is the profit watchword. There should be plenty of leafy green and root vegetables and seasonal fruits and berries as well as the more staple items. It is essential to work toward a profitable balance in sales volume from the lowest to the highest margins.

The appetite appeal of the bright colors of fresh fruits and vegetables can be capitalized on by arranging displays so that contrasting colors are placed next to each other. Light green and dark green, red, yellow, white and orange can be effectively used to create appealing color patterns. Dark green parsley emphasizes the delicate light green of lettuce, or the clean white of squash or the orange of carrots; bright red radishes with their green tops go well with the white and green of fresh onions, and so on.

Customers will get the idea they are selecting from leftovers if the produce stock is allowed to run low. Therefore the display should be refilled often enough to keep this from happening.

In preparing produce for display, simple but good back room equipment contributes a great deal to efficiency. A sink with ample drain boards, knives, brushes, and a short connection of rubber hose provide washing and trimming facilities for those commodities requiring this attention. One or more work tables for sorting merchandise and examining for decay and off quality are very useful in the back room operation.

If the commodity is dirty, it should be washed in the sink until clean. If it is wilted, it should be freshened with cold water, or the wilted portion trimmed off. If it is spoiled, it should be thrown away.

The difference between a stalk of celery that has been taken from a fresh crate, washed in cold, clear water, its bruised outer stems removed, trimmed to a clean, white point—and one that is simply taken from the crate and placed on display—is the difference between an ordinary produce department and an outstandingly successful operation.

There should be a space in every produce department where prospective customers may put down bundles and packages. Many a dollar's worth is left on the display because the lady can find no place to park her paraphernalia while she chooses what she wants or explores her pocketbook for the money to pay for it.

New Chemical Works Fast to Rid Lawns of Weeds

By DR. FLOYD BRALLIAR, Garden Editor

Many Nashville lawns are badly infested with dandelions, chickweed and plantain, to say nothing of other weeds.

These pests are rapidly growing now and should be destroyed at once. Fortunately, it is no longer a big job to do this.

If your lawn is scrawny and full of plantain and dandelions, spray at once with one of the modern weed-killers, such as Weednomore. Apply it properly on a sunshiny day.

This new chemical acts almost like magic, especially on dandelions, chick-weed and plantain. Within one week of the time the spray is applied, all these weeds properly sprayed will be dead. Because it is practically impossible to do a 100 per cent job of spraying with an ordinary hand sprayer, it may be necessary to spray a second time about 10 days later.

Will Not Hurt Grass

Fortunately, this spray material will not injure grass in any way. We have had some reports of its killing wild onions, but the general report is that it does not do so.

It is important however in using this spray not to get it on trees or broad leaf shrubs for it will kill them. It is especially effective in killing wild honeysuckle.

Nine lawns out of 10 should be fertilized every spring. We prefer to do this about a week before we spray for weeds though it is all right to put it on a week after. Without specifying any particular kind of fertilizer to use, while you are at it, do a good job. Two or three pounds of complete commercial fertilizer or four or five pounds of some good, fine manure to every hundred square feet, is about the right amount to use.

The only advantage of fine stable manure over the coarse type is that you have to rake the coarse type fine to keep it from looking unsightly. We always prefer to use organic fertilizer such as stable manure, rather than commercial fertilizer for lawns, as most lawns lack humus, and commercial fertilizer will not add humus to the soil.—The Nashville Tennessean.

Fire Heads the Disaster Roll

W. E. Mallalieu, General Manager of the National Board of Fire Underwriters, has called upon all sections of industry for better compliance with safety standards, in order to prevent such disasters as the fires and explosions which razed Texas City, killing hundreds of people, injuring thousands, and causing an enormous property loss.

His organization, he said, "will do everything in its power to meet the challenge of fire in this age of increasingly hazardous chemical compounds. For this we are speeding up our research into industry's fire problems.

"But we call on all industry, management and workers alike, for wholehearted compliance with all safety standards that are or may be promulgated."

The American Red Cross has stated that fires are responsible for more disaster relief calls than all other causes, including tornado, hurricane, and flood, combined. Furthermore, fire is often a contributing factor to loss of life even in floods and tornados. It has become one of the greatest killers—even as it is one of the greatest destroyers of property.

No community and no home is safe from fire. Eternal vigilance is necessary. The ghastly disaster at Texas City, like the hotel fires of last year, should have focused the attention of the entire country on this terrible menace.

Lives Saved

Adequate precautions, good construction, and fire safety rules are saving lives in hotel fires, according to the National Board of Fire Underwriters.

In Terre Haute, Indiana, for instance, fire broke out in a 10-story hotel. Fire Department officials said that the action of guests in not opening doors and running into corridors prevented what might have been a disaster.

In the Hotel Lincoln in New York, a mattress burst into flame from a cigarette. A heavy door prevented the spread of fire and smoke—proving that proper construction is one of the best defenses against conflagrations.

It is estimated that an inspection of hotels inaugurated on a statewide basis by Arkansas insurance men last summer saved 18 lives when a Hot Springs hotel burned. The inspection led to the clearing of a fire escape down which guests fled to safety.

Efficient work by the service personnel of a St. Louis hotel prevented panic from breaking out among 800 guests when fire started in a porter's room on the first floor and raced up a shaft to the 16th.

Fire prevention measures, including newly-installed protection of an elevator shaft, is credited with averting disaster in a recent Grand Rapids hotel blaze.

There are signs that the war against fire is bearing some fine fruit. We must keep up and intensify the work.

Need for Farm Labor Easing

Increased production of farm machinery and the availability of more agricultural workers have tended to ease the demand for white and colored farm hands, reports the Bureau of Agricultural Economics of the U. S. Department of Agriculture.

While the demand for unskilled agricultural workers is expected to be somewhat less this year, except during harvesting time, dairy hands and other skilled workers will continue to be sought yearround by farmers says BAE.

A sizable decrease in the acreage of burley tobacco will reduce the need for farm workers in Tennessee and Kentucky reports indicate. However, the general wage rate in tll sections is expctd to remain at the present level.

Healthy Sign

Two excellent examples of the intensified efforts of retailers to do something constructive about the price problem have recently appeared.

A retailers' organization whose membership is largely made up of stores dealing in mercantile lines, recommended that stores pledge buyers to seek out and eliminate over-priced goods; that they pass on to consumers intact any price reductions obtained; and that they apply the same price economies to their own operations that they are now demanding from suppliers.

In the food field, one of the country's largest chain systems announced that it can and will contribute to reducing the cost of living by immediately dropping retail prices on existing inventory when wholesale prices go down; that it will attempt to further reduce the in-between costs of distributing foods; and that its policy will be extremely small profits based on a large volume of business. In this connection, it pointed that its net profits were one and one-third cents per dollar of sales in 1946.

Retailing, of course, is but one segment of the economy and many basic costs are completely beyond its control. But the fact that it is devoting its resources to the price problem is one of the healthy signs of the times.

FATHER: "Junior, would you like to hear a little story?"

Five-year-old Junior: "Sure, Pop, but keep it clean. Mom might be listening."

The National Guard

One of George Washington's most famous statements was this: "To be prepared for war is one of the most effectual ways of preserving peace."

That should be remembered in the present troubled world. And it has an especial significance now that an aggressive effort is being made to build up the National Guard to its authorized strength of 682,000 men.

The Guard is a volunteer, civilian-soldier organization, and it has a long and distinguished record of service. It provides a priceless nucleus of trained men upon which an effective fighting force can be built in time of war. Units of the Guard were among the first to see action in the last conflict, and they fought gallant delaying actions while we worked against time to create a gigantic Army. And war is not the only emergency which the Guard is called upon to meet. In every great disaster, from the San Francisco fire of 1906 to the ghastly explosion at Texas City a short time ago, the Guard has done a superb job as a protector of life and property.

To young men, the Guard offers an opportunity to learn new skills, to improve old ones, and to acquire experience in organization and leadership. Each member draws a full day's Regular Army pay for two hours of spare-time training a week, and for each 15 days of field training a year. To the community, the guard is a proud local asset. It represents public service of the highest order.

"I GET LONESOME SOMETIMES"

The boy sat huddled so close to the woman in gray that everybody felt sure he belonged to her; so when he unconsciously dug his muddy shoes into the broadcloth skirt of his left-hand neighbor, she leaned over and said, "Pardon me, please; will you kindly have your little boy to square himself around? He is soiling my skirt with his muddy shoes."

The woman in gray blushed and nudged the boy away.

"My boy?" she said. "My goodness, he isn't mine?"

The boy squirmed uneasily. He was such a little fellow that he could not touch his feet to the floor of the bus, so he stuck them out straight in front of him, like pegs to hang things on, and looked at them deprecatingly.

"I'm sorry I got your dress dirty," he said to the woman. "I hope it will brush off."

"Oh, it doesn't matter," she smiled. Then as his eyes were still fastened on hers, she added, "Are you going uptown alone?"

"Yes, ma'am," he said. "I always go alone. There isn't anybody to go with me. Father is dead, and Mother is dead. I live with Aunt Clara, but she says Aunt Anna ought to help do something for me; so once or twice a week when she gets tired and wants to go to some place to get rested up, she sends me over to stay with Aunt Anna. I am going up there now. Some times I don't find Aunt Anna at home, but I know she will be at home today, because it looks like it's going to rain, and I don't like to hang around in the street in the rain."

The woman felt something uncomfortable in her throat and said, "You're a very little boy to be going about by yourself," rather unsteadily.

"Oh, I don't mind," he said. "I never get lost. But I get lonesome sometimes on the long trips, and when I see anybody I think I would like to belong to, I scrooge up close so I can make believe I really do belong to her. This morning I was playing that I belonged to that lady, and I forgot all about my feet. That is why I got your dress dirty."

The woman put her arm around the tiny chap and "scrooged" him up so close that she hurt him, and every other woman who had heard his artless confidence looked as if she would not only let him wipe his shoes on her best dress, but would rather he did it than not.

Univ. Of Illinois Lists Its Colored Graduates For 1947

Urbana-Champaign, Ill., June—Degrees were conferred upon 17 of the 271 Negroes enrolled at the University of Illinois during the 1946-47 school year, and many of these students were prominent in Athletics and in campus organizations. Ten of the 17 degrees were Masters Degrees, awarded for a year or more of successful graduate work.

Those who received degrees were:

On Sept. 15, 1946—Nathalie Olga Fisher, 4228 W. Cook, St. Louis, Mo., A. M., Education;; Horatio Raymond McNeil, 3435 Walnut, St. Louis, Mo., M. S., Biological Sciences; Agnes Elizabeth Jackson, 714 E. Seminary, Danville, Ill., M. S., Education; William Robert King, 633 E. Burnett, Louisville, Ky., Master of Music; James Jordan Seaberry, 9330 S. Michigan, Chicago, Ill., LL. B., Law.

Feb. 2, 1947—Franklin Johnson Gayles, Jr., 5839 Prairie, Chicago, Ill., A. M., Political Science; Welton Ivan Taylor, 1250 W. 112th, Chicago, Ill.. M. S., Bacteriology; James Arthur Turner, Jr., 4317 Enright Ave., St. Louis, Mo., M. S., Education; Charles Ellis Gaines, 3262 Vernon, Chicago, Ill., A. B., Liberal Arts and Sciences; Irene Alma Puckett, 707 E. 61st, Chicago, Ill., A. B., Liberal Arts and Sciences.

June 8, 1947—Burleigh Carlyle Webb, Sedalia, N. C., M. S., Agronomy; William McKinley Lewis, Tipton, Mo., M. S., Education; William Yancy Washington, Lovejoy, Ill., M. S., Education; Edward Pedro Cruzat, 111 S. 11th, Maywood, Ill., A. B,. Liberal Arts & Sciences; Betty Jeanne Esters, 811 W. 10th, Indianapolis, Ind., B. S., Education; Bert Coley Piggott, 307 S. Vine, Hinsdale, Ill., B. S., Special Service for War Veterans; Gwendolyn Bennett Ray, 6224 Rhodes, Chicago, Ill., B. M., Music.

Negroes who helped Illinois win the Western Conference Championship and the Rose Bowl Game in Football were: Claude H. K. Young, 13017 Evans, Chicago, Ill.; Isaiah H. Owens, 1620 Adams, Gary, Ind.; Paul L. Patterson, 1300 Grand, Aurora, Ill.; Bert C. Piggott, 307 S. Vine, Hinsdale, Ill.

On the Varsity Track Team, which won the Western Conference Indoor and Outdoor Championships, were: Herbert H. McKenley, Kingston, Jamaica; George R. Walker, 3112 W. 139th, Robbins, Ill.; William Mathis, 507½ 23rd N. W., Washington, D. C.

Prominent in Student Activities were: Frederick C. Ford, 4419 Aldine, St. Louis, Mo., Member Student Senate; George R. Walker, 3112 W. 139th, Robbins, Ill., MA-WAN-DA, Senior, Honorary Society, 1947-48; Herbert H. McKenley, Kingston, Jamaica-Sachem, Junior Honorary Society, 1947-48; Edward Pedro Cruzat, 111 S. 11th, Maywood, Ill.. Member Executive Committee, Inter-Fraternity Council; Charles Ellis Gaines, 3262 Vernon, Chicago, Ill., Member Executive Committee, Inter-Fraternity Council, Illinois Union Council, Debate Team; Betty Jeanne Esters, 811 W. 10th, Indianapolis, Ind., Y. M. C. A. Cabinet.

THE JESUS WAY

By AURORA M. SHUMATE

I want to be kind
In every way;
For that, you know,
Is the Jesus way.

A PRAYER

By A. K. HOLMES

Dear God, we thank you
For health to work and play.
We thank you for the friends we love.
We thank you for Jesus, our best friend.
Help us to be like him. Amen.

On the Agricultural Front

COLORED AGENTS OBSERVE HOME DEMONSTRATION WEEK

Four hundred colored home demonstration agents of State Extension Service staffs are carrying out varied activities during the observance of National Home Demonstration Week, May 4-11, according to reports received by the U. S. Department of Agriculture.

Action today for tomorrow's world is the keynote of the Week's events—all to be centered around the national theme: "Today's Home Builds Tomorrow's World."

Purpose of the Week's activities is to interest more families in the voluntary on-the-job education program planned and conducted by local women and the cooperative extension service of the United States Department of Agriculture and the Land-Grant Colleges.

Of equal importance is the objective of highlighting the problems effecting today's homes and communities, in an effort to stimulate individual and group action toward their solution.

Principal participants in the observance are the 3 1-2 million white and colored homemakers throughout rural America reached by the home demonstration program, and extension workers of the Department and State Land-Grant colleges.

Furniture workshops, slip cover clinics, skits, and banquets are being held in Virginia during the week, writes Miss Blanche D. Harrison, district agent.

While in Tennessee, special Home Demonstration Week sermons are being delivered in many churches, county-wide home demonstration club meetings, exhibits, and clean-up campaigns are being carried out, reports Assistant State Agent Bessie L. Walton.

In Louisiana, according to Mrs. Ruby F. Henton district agent, local radio programs, luncheons, tours, and special meetings are being held during the week to call attention to the progress in rural family living which the home demonstration agents are helping to achieve.

In Maryland, the home demonstration agents are launching a state-wide cleanup and lawn improvement campaign, says Mrs. Ethel Bianchi.

SUGARCANE WAGE HEARING TO BE HELD IN FLORIDA

The U. S. Department of Agriculture has announced that a public hearing was held at Clewiston, Fla., on May 10. to receive evidence on fair prices for the 1947 crop of sugarcane and on wage rates for persons employed in the production, cultivation and harvesting of sugarcane during the period July 1, 1947 to June 30, 1948. The hearing was held in the High School Auditorium beginning at 9:30 a. m.

Colored workers made up a large part of the labor force employed in the cultivation and harvest of sugarcane in Florida. In addition to the local colored workers, there are 2,000 Jamaicans, and about 500 Barbadians.

The Sugar Act of 1937 requires that, in qualifying for conditional payments, sugarcanes producer must pay wages not less than those determined to be fair and reasonable by the Secretary of Agriculture after public hearing and investigation. The Act also provides that in qualifying for conditional payments processors who are also producers must pay for sugarcane purchased from other growers at prices determined to be fair and reasonable by the Secretary.

LONG-RANGE AGRICULTURAL POLICY

In a statement last week before the opening hearing of the House Agricultural Committee which is considering long-range agricultural policy and programs, Secretary of Agriculture Clinton P. Anderson outlined a policy of organized, sustained and realistic abundance. In part, he said:

For the sake of brevity and practicality, let us put aside the matter of what we ought to have—either for good diets or good business. Let us look at the measurable wants of the people in this country—what people really want to buy. We can judge this from the actual buying habits of people who have comparatively good incomes.

What would you call the lower limit of a reasonably good family income? Under 1941 prices, would $2,000 per family be too much? That's less than $40 a week per family. But back in 1941, the families that had incomes of that much or more were approximately the top 40 per cent. At least, most of the families with prewar incomes of $2,000 or more could afford a generally adequate diet.

So let's assume their buying represents what the people of the United States want, and apply, their buying habits to the whole population. This indicates that people want about 40 pounds more meat per capita than they were getting between 1937 and 1941; they want over 200 pounds apiece more milk, about 9 pounds more chicken, 23 or 24 pounds more fresh vegetables, around 17 pounds more processed vegetables, an additional 50 pounds of citrus fruit, and over 80 pounds more of other fruits.

They apparently want a little less of beans and would continue the gradual, long-time trend toward lower per capita use of potatoes. I believe it is safe to assume that they would buy more products made from cotton, tobacco and wool although we do not have the precise measure for these products that compare with those I have just given for food.

Now let's see what these wants mean in terms of farm acreages and types of farming. Total up the wants of our people, add in conservative amounts for exports, imports, and industrial uses, allow for good yields, and here's the picture: We would need more than four hundred and twenty million acres for crops, orchards, rotation pasture and fallow land. That is almost exactly what our production goals call for this year. It's around 10 million acres higher than the comparable figure for last year or for the 1937-41 average. It's the continuing acreage we would need if people of reasonable income could buy what they have shown they want.

Our estimate of needed acreage allows for average weather and a continuing trend toward more efficient production. The 420 million acres we would need to meet our own personal wants, plus peacetime exports and industrial uses would be divided up quite a bit differently from prewar and even from last year's use of the land. Emphasis would be on livestock farming. This would mean more land in pasture and hay, less in small grains and potatoes and beans, not much change in food grain acreage. There would be less land in soybeans, than we had last year but more in truck crops, more cotton, and more in orchards.

USDA MAKES ALCOHOL FROM WHEY

Successful alcoholic fermentation of the lactose or milk sugar, in whey is announced by the Division of Dairy Laboratories in the Bureau of Dairy Industry, U. S. Department of Agriculture. Whey, a by-product of cheese and casein manufacturing plants, is one of the cheapest sources of fermentable sugar when normal supplies of whey are available. Furthermore, the disposal of waste whey offers difficulties in stream pollution.

The equipment required is relatively inexpensive. The alcohol can be made as a by-product of cheese or casein manufacture, using waste steam to concentrate the alcohol. The whey protein and slops remaining make an excellent by-product feed for cattle. Thus a former waste product which was hard to dispose of, may become an asset and a valuable source of useful products.

W. VA. EXTENSION ACTIVITIES INCLUDED IN WELFARE REPORT

The important contribution of agricultural Extension Service to improved living standards in the rural and semi-rural areas of West Virginia are described in the biennail report of the State's Bureau of Negro Welfare.

In a cloth bound volume of 120 pages, 13 are devoted to a pictorialized report by State Leader L. A. Toney on the Extension Service program of the State.

In that the report covers 1945-46, Mr. Toney describes both the wartime and postwar Extension activities which range from training new workers and assisting with the school lunch program to health clinics and improved housing programs.

Mr. Toney points out that in 1945, over 7,000 colored gardners enrolled in the victory garden program, and 72,000 quarts of food were canned in canning centers under the emergency food production program. Also, 4-H club boys and girls joined in the salvage campaign. During 1945 alone, West Virginia 4-H'ers collected 58,000 lbs. of scrap metal, 8,000 pounds of rubber, 98,000 pounds of paper, 86,000 pounds of rags, 700 pounds of waste fats and 600 pounds of milkweed pods, the floss of which was vital in the wartime manufacture of navy life jackets.

Since 1944, the enrollment of colored 4-H'ers in West Virginia, says Mr. Toney, has increased by 42 per cent. The number of 4-H club boys and girls in the State now totals 2,928. Incidentally, there are less than 700 colored farmers in West Virginia.

Former College President Raps College Men And Women for Wasting Money and Other Bad Habits; Few Able To Pass 8th Grade "Exams", He says

New York, N. Y.—College and University officials who boast of the tremendous progress they have made in adding buildings and other material improvements on their campuses; who can point to the remarkable increase in the number of young people they are turning out in their graduating classes annually and who generally appraise their regimes as being so much superior to those of their predecessors, are given "food for thought" in an able college man's pessimistic appraisal of the present-day crop of graduates, by a special article for the "Global News Syndicate" just issued.

The writer is the news syndicate's special representative, Dr. Leonard F. Morse, A. M. D. D. whose observations are made on the subject:

"Where Are the Recent Negro College Graduates?"

Dr. Morse says that only a few of the young people who have graduated within the past 32 years have made good. Thirty-two years ago, reports showed, says Dr. Morse, that the total number of "Negro college graduates was 400 while on the basis of 1946 reports the number was 9,000 and the expectation is that there will be some 18,000 college graduates in 1947. Dr. Morse then makes the following gloomy appraisal of college graduates since the colleges went in for "mass production:"

"Arrogant, poorly educated, hard-headed and unskilled the average Negro college graduate of recent years isn't anything to cause a serious minded person to go into ecstacies. Except for a small number of serious students one seldom meets a young college graduate who has enough fundamental training to pass a thorough eighth grade examination or sufficient initiative to solve or even ameliorate a simple social problem.

"Until twenty-five years ago every Negro graduate knew that he must count. The harvest was so great and the laborers so few, each one knew he must not fall down. There were very few failures. Today the harvest is still great. The laborers are more numerous to be sure, but in proportion to the harvest the scarcity is greater than it was three decades ago.

"The young Negro college graduate of today may be catalogued as one who seeks a good salary with nothing to warrant it but a diploma; good clothes, good food and drink and above all, a good time. This is doubtless just as true of young college graduates who are not Negro but that situation is more remote. The attitudes of the Colored boy and girl are what vitally concern us. The Colored graduate cannot be wholly blamed for this unhappy state of affairs. Often his parents and other well-intentioned influences start him off in his freshman year with just about the same program he pursues after he has finished his four-year college course. Many Negro college students receive from home more money to play with than members of the faculty receive for salary fifteen or twenty years ago. Many public school teachers today receive less money for salary than some of our college students receive monthly for "spending change." Many "poor and needy students" struggling through college on fat scholarships are able to spend their nights in expensive night clubs theaters and dance halls. They eat their campus dinner on charity but often spend enough for midnight suppers to pay for two weeks, board.

"Thus the average Negro college student is trained and pampered to the extent that he thoroughly believes his purpose in college is to prepare himself for a life that will offer him a good time with little or no effort on his part.

"The Negro college man and woman if they are to make any lasting contribution to society must learn that the pursuance of a college course is a tacit contract between them and society to do something—something that society needs for its perpetuity. The youth who goes to college or university with the sole purpose of personal betterment is doing an injustice to those behind him whose education depends upon the fruits of his labor. We prehaps shall never know how many deserving young people are being denied an opportunity to secure an education because of the poor showing of someone in the neighborhood whose college education has made no contribution to the community.

That those who read this article may have some assurance that I am not expressing a vague personal opinion, perhaps it will not be out of place if I state that in 1900, forty-seven years ago, I entered the first grade. From that day until this one I have been continuously connected in one way or another with a school even while pastoring or serving as a presiding elder. These connections have been those of a student, elementary school and high school principal, college professor, college president, seminary dean, college trustee, state summer school director, acting assistant county superintendent.

Perhaps some attention to the following points will help usher in a new day of useful service on the part of those to whom the race looks with eager eyes for help.

1. A student who enters college without a purpose is very likely to come out without one.

2. Too much money and too much leisure are more harmful than poverty and overwork.

3. The principal business in college is to learn something. The most important things to learn are not found in the library nor in the professor's lectures.

4. The basic essentials of a college education are: good sense, self-respect, love for all people, the ability to think objectivelly, a reasonable amount of initiative, patience, faith, tolerance, a passion for hard work, a deep sense of gratitude and a daily growing love of God.

With such an armor a comparatively dull "C" student is far better equipped for life's great adventure than the brilliant straight "A" valedictorian without such accouterments.

All hail, Class of 1947! ! ! Your Elders stand with welcoming arms to receive you into their ranks that you may share with them the joys and sorrows, the success and the disappointments, the ecstacy and the despair in the thrilling adventure of making men and women, of building a race and forging a new America.

1,400 Enroll In Summer School At A&I State College

The enrollment of the 1947 Summer Session at Tennessee A. & I. State College approached 1,400, as President W. S. Davis formally welcomed teachers from all over the state at the first chapel service on Thursday, June 12. It is probable that late registrants will carry the number of students over the fifteen hundred mark.

Two hundred and four of those registered are enrolled in the Graduate Division, pursuing studies leading to the degrees of Master of Arts and Master of Science. The largest group of registrants is the Junior Class, with an enrollment of 236, closely followed by the Sophomore Class, with an enrollment of 211. There are 180 freshmen and 179 seniors. All the others are unclassified, special students, or students pursuing special training in one or more of the skilled trades.

By C. B. Lindsay.

A. and I. State College Begins, Summer Quarter

By C. B. LINDSAY

June 11

Registration for the 1947 Summer Quarter of the Tennessee A. and I. State College began Monday, June 9, and continued through Monday, June 16. Classroom work began on Wednesday, June 11. As in the past, the Summer Quarter this year will be divided into two terms: the First Term begining June 9 and ending July 16; the Second Term beginning July 17 and ending August 22.

Instruction will be given in all of the ten divisions of the College; the Division of Agriculture, the Division of Business, the Division of Education, the Division of Engineering and Industrial Education, the Division of History and Geography, the Division of Home Economics, the Division of Humanities, the Division of Political and Social Science, the Division of Science, and the Graduate Division.

In addition to the regular offerings of the College, the following special features will be open to qualified students: the Summer Theatre Workshop for teachers who have an interest in the promotion of dramatics in public schools and colleges; the Summer Institute for Science Teachers (June 9-June 28), the purpose of which institute is to provide an opportunity for a limited number of science teachers in the secondary schools of Tennessee to work with the College science staff and other specialists on problems of curricular planning, instructional facilities and techniques of science teaching; the National Aquatic School (June 23-July 3), conducted by the American Red Cross, with the cooperation of Tennessee A. and I. State College; the Workshop in Aviation Education which will be a study group to prepare materials and recommend techniques for the introduction of aviation study in the standard curricula; the Agricultural workshop (June 9 through June 28) for in-service-teachers of vocational agriculture; the Adult Education Workshop (June 30-July 16) conducted jointly with Fisk University under the sponsorship of the United States Office of Education; and the Athletic Coaching Clinic.

The Tennessee State Department of education is conducting a three-weeks workshop (June 9 to June 26) for principals and supervisors to interpret the new state program of education as established by the 1947 legislature.

Veterans may receive training in the Vocational Trade Division of the College, as well as in any other department of the institution, as their interests and qualification may indicate.

WOMAN'S PAGE

Salads, New and Old Try These Sometimes

STUFFED TOMATO SALAD

Select any number of tomatoes desired, peel, scoop out center, chill and fill with any of the following combinations, well-seasoned:

Meat from six tomatoes, shredded cabbage (½ cup), 1 cup chopped celery and mayonnaise.

Tomato meat, 1 tablespoon minced onion, 1 cup chopped cucumbers, ½ cup crab meat, mayonnaise.

3 hard-cooked eggs chopped, tomato meat, teaspoon onion juice, 1 cup minced ham, cooked dressing.

Green peas, minced celery and mayonnaise.

Sliced alligator pear and French dressing.

Shrimp, chopped celery, and mayonnaise.

Chicken salad, or mock chicken salad.

Waldorf salad.

Asparagus tips, green pepper rings, French dressing.

Chopped pineapple, apple, celery, and mayonnaise.

Cottage cheese, chopped nuts, and mayonnaise.

Slaw.

Frozen vegetable or frozen cheese salad.

Salmon and cucumber salad.

Spaghetti salad.

SPAGHETTI SALAD

¼ pkg. of spaghetti
2 hard-cooked eggs
½ cup of nippy cheese cut in cubes
½ cup chopped celery
2 peeled and chopped tomatoes
1 tsp. onion juice
1 chopped pimiento
Mayonnaise dressing

Break spaghetti in small pieces; boil in salted water until soft. As soon as tender, place in a bowl of ice water to bleach. When cold, dry on soft towel; mix with other ingredients and just enough mayonnaise to hold together. Let stand one-half hour to season. Tomatoes should be drained before adding to mixture. Arrange on lettuce leaves with a stuffed olive on top of each serving. Serves six.

SHRIMP SALAD

½ cup shredded cabbage
2 cups cold boiled shrimp (cleaned)
1 cup celery, chopped
1 head lettuce
Salt and pepper.

Cut shrimp in two, season well with salt and pepper. Chop lettuce; add celery and cabbage; season. Place in dish a layer of shrimp, one of lettuce mixture; spread with mayonnaise; another layer of shrimp and lettuce mixture spread with mayonnaise. Garnish with sliced hard-cooked eggs, diced beets, and lettuce hearts. Serve very cold. Serves eight.

CRABMEAT SALAD

2 cups shredded cooked or canned crab meat
1-3 cup mayonnaise
1 cup celery, chopped
½ cup French dressing
2 hard-cooked eggs

Mix crab meat and celery with French Dressing. When ready to serve, add mayonnaise. Garnish with sliced eggs and lemon wheels dipped in parsley. Serves six or seven.

TUNA FISH SALAD

1 cup canned tuna fish
2 pickles, minced
4 tbsp. French dressing
1 cup celery, chopped
2 hard-cooked eggs
4 tbsp. mayonnaise

Mix celery, pickles, and tuna fish with French dressing. Serve on crisp lettuce. Garnish with sliced eggs, paprika, and mayonnaise. Serves six.

POTATO SALAD

2 cups boiled potatoes
1 onion, minced
3 hard-cooked eggs
Cooked dressing

Chop onion fine, cut potatoes in cubes, cut yolks and whites of eggs in small pieces or rings. Mix with cooked dressing. Season. Cut potatoes in balls, with vegetable scoop for top of salad. One-half pound crisp bacon makes a nice addition. Serves six.

CHEF'S SALAD

1 head lettuce
2 tomatoes cut in quarters
4 spring onions (chopped)
2 hearts celery (chopped)
2 hard-cooked eggs
6 anchovies (if desired)

Wash lettuce and shake off moisture. Break lettuce apart—do not cut. Put in chilled salad bowl. Add remaining ingredients. Toss salad together lightly with French dressing.

Any combination of greens along with onion, tomato and hard-cooked eggs may be used in a salad bowl and served with either French, Russian or Roquefort cheese dressing.

COTTAGEE CHEESE SALAD

1 lb cottage cheese
1-8 tsp. white pepper
Dash Cayenne
1 tbsp. minced onion
½ tsp. salt
8 tbsp. mayonnaise
1 tbsp. Worcestershire sauce.

Press all milk out of cheese; season with above ingredients; chill thoroughly and serve on crisp lettuce. Finely chopped green pepper, celery, cucumbers, or olives may be added in the proportion of 2 tbsp. of either or each. Serves 6 to 8.

Fruit salad may be used as the first course on a menu, as an appetizer with the main course; with cheese, as the main dish of a luncheon or supper; or it may be chosen as a dessert. Dressing may be made French, cooked or mayonnaise.

COOKED SALAD DRESSING

1 tsp. dry mustard
1 tsp. salt
1 tbsp. sugar
1 tbsp. flour
2 eggs
¾ cup milk
¼ cup vinegar and lemon juice mixed
1 tbsp. butter or oil

Mix all the dry ingredients together. Add well-beaten eggs. Add milk and vinegar. Place on low heat. Cook until thickened, stirring canstantly. Remove from unit. Add butter and cool. Serve on salad as desired. May be thinned with cream.

FRENCH DRESSING

¼ cup vinegar
¼ cup lemon juice
1 egg white
1 tsp. paprika
1 tsp. mustard
1½ tsp. salt

Place egg white, mustard, paprika into a bowl and beat. Pour into a quart jar and add the remaining ingredients. Shake well.

VARIATIONS:

Spanish-French Dressing: To 1 cup of French dressing, add 2 hard-cooked egg yolks (mash), 1 pimiento, minced, and 1 tbsp. parsley.

Fruit French Dressing: Substitute ¼ cup orange juice for the vinegar, omit the garlic and mustard. Add 2 tbsp. of crushed mint leaves if desired.

Criffonade Dressing: Add to French dressing recipe 1 shredded pimiento, 1 tbsp, minced parsley and 1 hard-cooked egg, chopped.

Chili-French Dressing: Add to the French dressing recipe ¼ cup chili sauce and 1 tbsp. of sugar if desired.

MAYONNAISE DRESSING

2 egg yolks
¼ cup vinegar
1 tbsp. lemon juice
1-8 tsp. pepper
1 tsp. salt
1 pt. salad oil

Beat egg yolks and add few drops of vinegar. Drop oil, drop by drop, into egg mixture until ¼ cup is used. Then gradually increase the amount of oil added, beating constantly. As mixture thickens, add the rest of the vinegar and lemon juice a little at a time. Add salt. Lemon juice may be used in place of vinegar, if preferred.

VARIATIONS:

Russian Dressing: To 1 cup of mayonnaise add 2 tbsp. chili sauce, 1 tsp. Worcestershire and 1 tsp. lemon juice.

Thousand Island Dressing: To 1 cup mayonnaise add 4 tbsp. chili sauce, 1 tbsp. green pepper, 2 tbsp. pimiento or red pepper, 1 tbsp. chives.

Horseradish Mayonnaise: To 1 cup of mayonnaise add ¼ cup grated horseradish. Serve with corned beef, tongue or seafood.

TUNA A LA KING

1 7-ounce tin tuna
Oil drained from tuna
3 tablespoons butter
1-3 cup chopped green pepper
1 tablespoon chopped onion
1 cup fresh mushrooms, sliced
3 tablespoons flour
1 cup water
1 tall can evaporated milk (1 two-third cups)
1½ teaspoons salt
Few grains cayenne
Few drops hot sauce
3 tablespoons chopped pimiento
1 egg

Drain oil from tuna and combine with butter in saucepan over moderate heat. Add green pepper, onion and mushrooms and saute slowly about 8 minutes. Sprinkle flour over vegetables, stir in water and evaporated milk (reserving about ¼ cup milk to mix with egg), and cook until thickened, stirring constantly to keep smooth and free from lumps. Add salt, cayenne, hot sauce, flaked tuna, and pimento. Just before serving, beat egg with fork, mix with remaining milk and stir into creamed mixture. Heat, but do not boil, and serve at once with toast points or in patty shells. Yield: 4-6 servings.

CHOCO-MINTWICHES

1¼ cups sifted flour
1 teaspoon baking powder
½ teaspoon soda
½ teaspoon salt
½ cup cocoa
2-3 cup shortening
1 cup sugar
1 egg
½ cup bran
¼ cup milk

Sift flour with baking powder, soda, salt and cocoa. Beat shortning until creamy, add sugar gradually, continue beating until light and fluffy. Add egg and bran; beat well. Stir in sifted dry ingredients alternately with milk; mix until well blended; wrap dough in waxed paper and chill. Form into rolls about 2 inches in diameter; wrap well in waxed paper and chill for several hours overnight. Cut in slices about ⅛ inch thick and place on ungreased baking sheets. Bake in slow oven (325 degrees) about 10-12 minutes or until done. Remove from baking sheets while still warm. When cold, put cookies together in pairs with mint filling.

Mint Filling

Combine 2 cups sifted confectioners' sugar and ⅛ teaspoon salt; add ¼ cup milk gradually, beating until smooth. Add ¼ teaspoon peppermint extract and a few drops of green coloring. Beat well.

CHICKEN GLAZE

For that rich chicken glaze, baste it with melted currant jelly. The melted jelly helps in the browning, produces a high luster and adds a subtle tangy flavor to both skin and gravy that all will like but few will be able to identify.

BANANA WAFFLES

2 cups sifted flour
3 teaspoons baking powder
1 teaspoon salt
2 tablespoons sugar
3 eggs, separated
1 cup milk
¼ cup melted shortening
2 cups mashed banana

Sift together flour, baking powder, yolks and add milk, shortening, and banana. Add to flour mixture. Mix to a smooth batter. Fold in stiffly beaten egg whites. Bake on hot waffle iron. Makes 6 seven-inch waffles.

MOCHA MOLASSES BARS

2 cups sifted flour
½ teaspoon baking powder
½ teaspoon soda
½ teaspoon salt
½ teaspoon cinnamon
1-3 cup shortening
¼ cup sugar
¾ cup molasses
1 egg
½ cup hot coffee
½ cup raisins
¼ cup chopped nuts

Sift together flour, baking powder, soda, salt, and cinnamon. Cream together shortening and sugar. Add molasses gradually, mixing well. Add egg and beat until light and fluffy. Add hot coffee and mix well. Add flour to creamed mixture and mix until smooth. Add raisins and nuts. Bake in a greased paper-lined 11x16-inch pan in moderate oven (350 degrees) 15 to 20 minutes. Cut in bars about 1 inch wide and 3 inches long. Yield: About 4 dozen cookies.

CHEESE-NUT SPREAD

Spread sandwiches with this cheese and nut novelty. Soften sharp-flavored club cheese by letting it stand in a warm room. Add a few tablespoons of tomato catsup, salt and onion juice to taste, and chopped English walnuts.

INDIVIDUAL VEAL LOAVES

1 pound ground veal
1 pound ground pork
1 can chicken soup
1 cup quick-cooking oatmeal
1 egg
2 teaspoons salt
¼ teaspoon pepper
1 tablespoon onion juice
Paprika

Combine all ingredients except paprika and mix well. Make into 8 individual patties and gently pack the patties on edge in a loaf pan, making a solid loaf. Sprinkle with paprika. Bake in a moderate oven (350 degrees) for 1½ hours.

To serve, slice between individual loaves. Yield: 8 loaves.

CHICKEN GELATIN SALAD

2 tablespoons gelatin
¼ cup cold water
1½ cups chicken broth
2 pimientos
1 tablespoon minced onion
½ cup diced celery
1 cup diced chicken
½ cup salad dressing

Soften the gelatin in cold water and dissolve in hot chicken broth. Chill. Add the cut-up pimentos, minced onion, diced celery and chicken. Allow to congeal slightly, then fold in the salad dressing. Serve on lettuce leaf. Serves six to eight.

Cabbage ranks near the top of the vegetable list. It contains the B Vitamins, thiamine, riboflavin, and niacin, and the mineral calcium. The greener leaves of cabbage contain Vitamin A.

ASPARAGUS VINAIGRETTE

1 bunch asparagus cooked and chilled
1 tablespoon vinegar
3 tablespoons salad oil
1 hard-cooked egg, chopped
¼ teaspoon white pepper
1 teaspoon chopped chives

Place chilled asparagus on individual plates. Mix all other ingredients thoroughly, adding chopped egg last. Pour resulting sauce over asparagus and serve as a first course, or in place of salad.

LAMB-RICE CASSEROLE

1 boned lamb breast
2 tablespoons lard
1½ cups uncooked rice
1 cup grated carrots
½ cup chopped onions
2½ teaspoons salt
¼ teaspoon pepper
1 cup canned tomatoes

Cut lamb breast into small cubes. Brown in melted lard in frying pan. Wash the rice and combine with carrots, onions, salt and pepper. Place in casserole dish. Form a nest and place the cubes of browned lamb in the center. Add the tomatoes mixed with 1 cup of water. Cover tightly and bake 45 minutes. Add 1 cup more water at this time. Replace cover and bake another 45 minutes. 5 to 6 servings.

JELLIED TUNA SALAD

1 envelope plain unflavored gelatin
¼ cup cold water
1-3 cup mayonnaise or cooked salad dressing
2-3 cup cream
1 cup flaked tuna fish, salmon or crab meat
½ cup chopped celery
2-3 cup cooked peas or string beans
¼ cup chopped green pepper
2 tablespoons chopped olives
½ teaspoon salt
1 tablespoon mild vinegar
¼ teaspoon paprika
Few grains cayenne pepper

dissolve over hot water. Cool and disolve over hot water. Cool and add mayonnaise or cooked salad dressing and cream, fish, celery, peas, green pepper, olives, salt, vinegar, paprika and cayenne pepper. Mix well. Turn into molds that have been rinsed in cold water and chill until firm. Unmold on lettuce leaves and garnish with watercress. Serves 6.

MINTED PEARS

Chilled, delicately tinted minted pears are an excellent accompaniment for lamb or pork dishes. To prepare them, drain syrup from canned pears. Boil syrup several minutes until amount is reduced by half. Remove from heat. Add two drops of peppermint oil and small amount of green vegetable coloring. Pour syrup over pears, turning until each half is well glazed. Chill before serving.

SUGAR vs HONEY

A cup of honey is about one and one times as sweet as a cup of sugar. However, weight for weight, honey and sugar have the same sweetening properties.

A little flour sprinkled on raw slices of potato before frying helps to keep them crisp.

BEAUTY TIPS

Water, milk, vegetables and fruits can bring the roses to your cheeks more permanently than all the jars of creams on the market.

Eight hours or more sleep at night can erase the circles, little lines and crow's feet from your eyes quicker than eye creams.

Exercise and diet that is well balanced can do more for your figure beauty than masseuses and magic reducing formulas.

If the sink becomes stopped up put a handful of soda down the drain, then pour in a half glassful of vinegar.

THE MODERN FARMER

VOL XX. NASHVILLE, TENN. JULY 15, 1947 No. 6

THE BYRD NEST

By Rev. Bernard O. Byrd
—Guest Columnist.

THERE IS NO EXCUSE FOR DARKNESS

There are few excuses for some people's inability to do some things, because of the fact that in many instances other people have done things which hinder their fellowmen. There are some things, however, which God has not allowed to be controlled by men, thus guaranteeing all the opportunity for their enjoyment and benefits.

"As long as I am in the world, I am the light of the world." said Jesus, thereby letting men know that an ordinary man or a group of ordinary men would never be able to control the light needed by humanity. Since He is the light, all men who live with Him cannot be in darkness. The writer goes further into the reasoning to say that nothing can prevent one from entering into the light. Efforts have been made by individuals and organizations and even national governments to prevent men from entering into the light of Christ, but all with no avail. From the days of Babylon under Nebuchadnezzar to the days of Russia under Stalin, men have been unable to extinguish the light of righteousness in God. Efforts have been made by use of prisons, swords, chopping-blocks, hungry wild beasts, governmental decrees, widespread persecutions, threats, and even death have all failed to put out the light of Christ.

Any man who lives in darkness, does so by choice. In so many centers of the United States, we find people groping in the darkness of ignorance. This ignorance is in both secular and spiritual affairs. Secular ignorance is civil criminology, and spiritual ignorance is divine criminology. To clarify, the writer gives this explanation. The person who in the midst of all the existing institutions and facilities for advancement in the knowledge and skill, continues to remain unlearned and untrained is committing a crime against civilization. Civilization as we know it today, is but a combination of all our advancement and our conservatism, in cooperation with and in resistance to each other. Some elements of progress are helpful both in their advancement and in their being retarded by some factors of conservatism. Social and industrial progress are both very fast, but each needs a governor for regulation. We may compare these things to the steam engine, which if left to itself will increase in speed as long as steam is available, but that safety of operation may be a certainty, protecting the machine and its purpose, governors are placed upon the machine to establish regularity. The big question concerning the Atomic Bomb is not whether or not it represents progress; the question is, "Is there any way to put a governor upon atomic power for regulation?" Any unregulated force, though it represents advancement, it is dangerous in its progress.

Likewise spiritual ignorance is Divine criminology: as was stated above. By way of explanation the writer wishes to state that despite all of the mistakes that may have been made and despite all the weakness and insincerety to which men may point as they behold the

Miss Rachel R. Carter Home Agent Is Given Coveted Algernon Sullivan Award

Gets High Appointment

—USDA photo by Forsythe.

A. H. Fuhr

Newly appointed assistant to the Governor of the Farm Credit Administration of the U. S. Department of Agriculture. His duties will include working with the general agents of the southern districts of the Farm Credit Administration and other officers in informing Negro farmers of the credit facilities through the FCA. Fuhr, who was for 18 years a county agent in Oklahoma, transferred to his present post from the Production and Marketing Administration, where he served as a State contact representative in Oklahoma.

Pleas Orr, Young Farmer, Discussed Mechanization In Broadcast June 7th

Washington, D. C.—

Pleas Orr, a young colored farmer who has almost completely mechanized the operations on his 410-acre farm in the Tennessee Valley region of northern Alabama, discussed mechanization with his county agent over Station WAPI in Birmingham, June 7, 2:30 p.m., reports Dr. J. R. Otis, colored State leader of Extension work in Alabama.

Mr. Orr, who grew into farming by way of 4-H club projects, was interviewed by Announcer Jimmie Wilson and County Agent B. F. Hill. He explained how he and two

Wins Coveted Award

Miss Rachel R. Carter (center, right), home demonstration agent of Amherst County, Va., shows officials of Virginia State Extension Service the Algernon Sydney Sullivan scroll she received recently from Sweet Briar college in recognition of 25 years of outstanding service to the people of Amherst County. Left to right are: S. E. Marshall, district agent, Miss Lizzie A. Jenkins, retired district agent, Mrs. Thelma Hewlett, county home demonstration agent at-large, Miss Carter, Ross W. Newsome, state agent in charge of Negro work, and Miss B. D. Harrison, district agent.

Colored Extension Supervisors In Conference at Prairie View College In Texas

Methods of improving the agricultural Extension program to the end that colored farmers may be better served are being discussed this week at the Regional Negro Extension confcrence in session at Prairie View university, Prairie View, Texas, June 9-13.

H. H. Williamson, asst. director of Extension Scrvice, will be the principal speaker. He will discuss the impact of the changing farming pattern in the South on the Extension program. Other important topics to be discussed are: Farm mechanization, rural health facilities, rural housing, and techniques of supervision.

The program is being directed by T. M. Campbell and John W. Mitchell, Federal Extension field agents. Colored Extension supervisors from 13 States are in attendance.

Home Food Preservation Week Was Observed June 22 Through June 28th

The U. S. Department of Agriculture has announced that June 22-28 was designated Home Food preservation Week.

The week's observancc was held for the purpose of focusing the attention of white and colorcd homemakers upon the opportunity of improving the nutritive value and variety of family meals through home food preservation.

"The wartime gains we have made in nutrition through home food preservation and other activities should be maintained and encouraged further," says Secretary of Agriculture Clinton P. Anderson. "Through home food preservation, homemakers can assure more nutritious meals for their families yearround. This will help materially in improving national dietary standards."

(Continued On Page 4 Col. 2)

Home Demonstration Agent of Amherst County Virginia Is Honored

Washington, D. C.

In recognition of 25 years of effective service as a home demonstration agent in Amherst County, Va., Miss Rachel R. Carter was presented the coveted Algernon Sydney Sullivan Award recently by Sweet Briar, outstanding women's college of Virginia.

Miss Carter was voted the honor by the faculty of Sweet Briar. Ordinarily, this founders' day award is conferred annually upon some member of the faculty of the college for outstanding service and for the application of spiritual qualities to daily living. But Miss Carter's contribution to the relief of starvation in Europe through her community canning program, together with her long-time service to the people of the county led Sweet Briar to pass over its own staff in making the award for 1946.

During the 14 years that the college has been conferring the award, only two non-faculty members have been recipients. Mrs. Theodorsa S. Lee, white, was first, and Miss Carter was second.

In presenting the award, Dr. Martha B. Lucas, president of the college said, "Because of the spiritual strength revealed in your daily life and in your 25 years of unselfish service to our fellow-man, I confer upon you the Algernon Sydney Sullivan Award that all may be inspired to work courageously together for a better world."

The award which is given under the auspices of the New York Southern Society, in memory of Algernon Sydney Sullivan, consists of a plaque and a scroll.

Until recently, Miss Carter was the only colored agent in the county. She not only helped the farm women with their canning, poultry, and general homc improvement programs, but she also helped the

Red Plains Experiment Station Field Day Held May 29th At Guthrie Okla.

Guthrie, Oklahoma (May 29,1947) "Our farming frontiers to the east and west of us have vanished and the only frontier left is the soil beneath our feet" Shawnee Brown, State Director of County and Home Demonstration Agent work told Negro farmers here today.

Brown speaking to more than 750 Negro farmers, County Agents, Vocational Agricultural Teachers and Veterans Training instructors at the Red Plains Conservation Experiment Station Field Day for Negroes further stated that in order to conquer this frontier as did our ancestors it will be necessary that we use good sound judgment in setting up a soil conserving and soil building program and execute this program as conditions will permit.

He warned that we must not over look our youth and the work they are doing. He paid compliments to the work the Negro 4-H Club members of the state are doing along the line of soil improvement. "On their shoulders", he said, "rests the responsibility of our lands in future years."

Getting back to the responsibilities of the farmers, Brown stated that poor land can result only in low producing crops, thus reducing the farmers income and standard of living for his family. We have no control over the rainfall, sunshine, or the air, however we can do a great deal with regard to building and conserving the soil, he said.

H. H. Finnell of the Research Division, Soil Conservation Service, Washington, D. C., in speaking to the group outlined three major points. 1st., that soil erosion had become so bad that it has been necessary to concentrate extra efforts toward its control; 2nd., that soil conservation is not solely erosion control but that efficient land use must also be considered and 3rd., that good farming practices will complete the job.

Harley A. Daniel, Project Supervisor of the Guthrie Experiment Station welcomed the group at noon. "It is the largest turn out we have had to an event of this nature for Negroes," he told them, "and we

"A Year-Round Public Responsibility"

In May, the President's Conference on Fire Prevention adopted an Action Program which should be put into effect in every state without delay. One of its essential proposals is that all governors appoint statewide fire safety committees and that each state hold a fire prevention conference to establish a practical line of action tailored to its own particular needs.

The Action Program is all-inclusive. It contains reommendations, framed by the leading fire prevention experts of the nation, on such vital matters as law enforcement, building construction, fire-fighting services, public education, and research. But it will be of no avail if states and communities fail to put it into effect. It offers the nation an opportunity--and it is up to the people to accept it.

No one can doubt that the magnitude of our fire loss constitutes a real national emergency. More than 10,000 lives and $561,000,000 worth of property were destroyed last year. The total, unless it is checked, will be higher this year. Month after month, the figures have been rising.

In opening the Conference, President Truman said: "Fire Prevention is a year-round public responsibility. I believe the highest state and municipal officials must assume greater responsibility for leadership in this field" The time to act is now.

Homemakers To Save Out Own Canning Sugar

It is up to homemakers this year to save out enough sugar for canning from the family's increased allotment.

A minimum of 35 pounds of sugar is assured every household consumer. This is 10 pounds more than was allotted last year, including the canning allotment. But this year no stamps are being specifically designated as home canning stamps. The 35 pounds include sugar for canning and all other home purposes, says the Sugar Rationing Administration of the U. S. Department of Agriculture.

Both stamps 11 and 12 are now good for 10 pounds of sugar each, and another stamp will be validated for 10 pounds not later than August 1. These stamps will expire on October 31.

Homemakers are being urged to purchase their allotment of sugar now in order to help ease transportation difficulties.

Girl, Ten, Receives Scholarship

Daughter of Chicago Couple Will Enter University Of Chicago This Fall

According to The Chicago Tribune daily newspaper of last week, a colored girl, ten years old, has received two years' scholarship to enter the University of Chicago. It is said that she is the youngest to ever enter the university.

The news item not only tells of the award, but carries her picture:

Adrian Gordon, 10, daughter of Mr. and Mrs. David Gordon of 615 Bowen Ave., Saturday looked forward to a college education—not years hence, but next fall. She will enter the University of Chicago on a two year scholarship of $400. She is a pupil at the Fuller School, where she received the highest grades in the school's history. She learned to read before starting kindergarten.

4-H Fat Stock Show

Negro 4-H club members of Harnett County, North Carolina, will set a precedent on June 12, when they stage the first Fat Stock Show and Sale to be conducted in North Carolina by Negro youth, according to a report received by U. S. Department of Agriculture from the North Carolina State Extension Service.

Red Plains

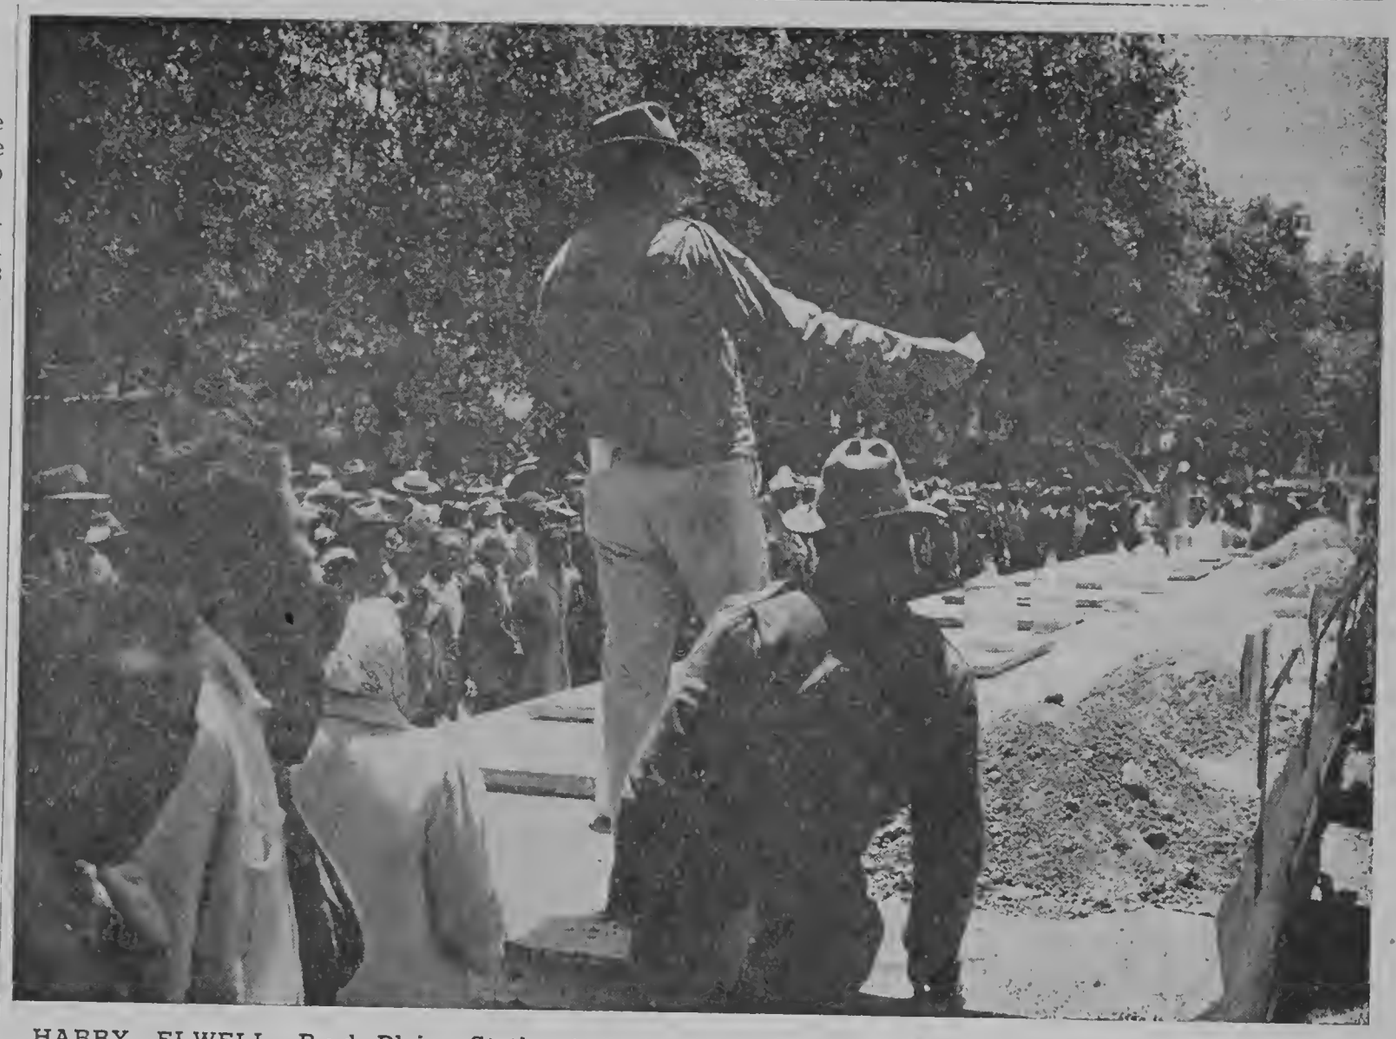
(Continued from page 1)

want you to make further use of the station. Experimental results are no good until they are put into actual practice on peoples farms".

The group spent the morning observing results of experimental work on the station, studying grass experiments, terrace outlets channels, methods of revegetation and gully control, crop rotations, strip cropping and effect of plant cover on run off and erosion. The afternoon tour of the farm included study of reclamation of land for pasture and meadow and effect of burning on vegetation. There was also brush mowing and tree poisoning demonstrations. Harry Elwell, Station Soils Conservationist and Maurice B. Cox, Agricultural Engineer supervised the field tours.

Kennith Black, 4-H Club member of Logan County discussed the 4-H Club members responsibility to the soil during the noon day program. "We are stewards of the Soil", he said, "if any fail in his stewardship, his descendants shall fail and vanish from the earth. Only by proper land use can we retain the heritage we have".

The Field Day was sponsored by the Guthrie Experiment Station, Extension Service, and Guthrie Chamber of Commerce. More than twenty counties were represented by farmers, County Agents, Vocational Agricultural teachers, and Veterans classes. The noon meal was sponsored by the Guthrie Chamber of Commerce and prepared and served by Negro Home Demonstration clubs of Logan County, supervised by Miss Rosa J. Parker House, Logan County Home Demonstration Agent. Paul O. Brooks, Negro District Agent acted as chairman of the noon time program.



HARRY ELWELL, Red Plains Experiment Station Soil Conservationist explains results of experiments on soil erosion control at the Station to a group of Negro farmers at the Negro Field Day, held at the Station May 29. More than 750 farmers, County Agents, Vocational Agriculture teachers and others attended the meeting.

Farms Of Nonwhite Farm Operators, Number Of Farms, Land In Farms, Cropland Harvested, And Value Of Land And Buildings, By Tenure: Censuses Of 1945 And 1940

Final figures: Arkansas

The 51,275 farms of nonwhite farm operators in the State of Arkansas on January 1, 1945, comprised 11,469 operated by owners, 12 operated by managers, and 39,794 operated by tenants, according to final figures from the 1945 Census of Agriculture released today by Director J. C. Capt of the Bureau of the Census. From April 1, 1940, to January 1, 1945, the total number of farms of nonwhite farm operators in the State of Arkansas declined from 57,025 to 51,275, or 10.1 percent. There was a gain of 916 in the number of owner-operated farms, a decrease of 7 in the number of farms operated by managers, and a decrease of 6,659 in the number of tenant farms.

In 1945 the number of nonwhite owner-operated farms in the State of Arkansas was someewhat higher than the number of nonwhite owner-operated farms recorded for the State in any Census of Agriculture between 1925 and 1940. The rise in farm ownership among the nonwhite farm operators during the period 1940 to 1945 is especially significant in that it reflects, for the most part, favorable changes in farm income and the purchase of farms uhder the terms of the Bankhead-Jones Farm Tenant Act.

Notwithstanding the induction of males of military age into the armed forces and the rise in farm ownership, the decline in the number of farms of nonwhite tenants between 1940 and 1945 was much pronounced than the decline of 13,487, or 22.5 percent, in the number of nonwhite farms during the period 1935 to 1940.

Census of Agriculture data show that the pattern of change in land in farms of nonwhite farm operators between 1940 and 1945 was similar to the pattern of change in the number of farms. Land in farms of all nonwhite-operated farms in 1945 was 142,539 acres, or 7.6 percent, below the 1940 total of 1,870,918 acres. There was an increase of 17,267 acres (2.6 percent) in land in owner-operated farms, but the farms of managers and tenants sustained losses of 1,440 acres and 158,366 acres, respectively.

From all nonwhite-operated farms, there was a decrease from 1,138,647 acres to 1,008,357 acres in cropland harvested between 1939 and 1944. Tenant farms, however, accounted for somewhat more than 92 percent (92.4 percent) of the decrease of 130,290 acres in cropland harvested on nonwhite-operated farms. For tenant farms, the absolute decline in cropland harvested was 120,324 acres, that is, from 861,430 acres in 1939 to 741,106 acres in 1944.

The value of land and buildings of farms of nonwhite farm operators rose from $64,034,632 in 1940 to $84,878,350 in 1945, for an increase of $20,843,718 (32.6 percent) in about 5 years. Of the total increase in value of land and buildings of nonwhite-operated farms, owner- and tenant-operated farms accounted for $20,662,772, or 99.1 percent. The absolute increase of $12,231,419 in value of land and buildinbs of tenant farms was $3,800,066 above the absolute increase in value of land and buildings of owner-operated farms ($8,431,353). but the percentage of increase in the value for owner farms (51.2 percent) was considerably higher than the corresponding percentage of increase for tenant farms (26.0 percent).

Each of the 75 counties in the State of Arkansas except Baxter, Boone, Carroll, Cleburne, Fulton, Greene, Marion, Newton, Polk, Scott, and Searcy, had 1 or more nonwhite-operated farms in 1945. The following 7 counties, however, had somewhat more than one-half (50.5 percent) of the farms: Crittenden, Desha, Jefferson, Lee, Mississippi, Phillips, and St. Francis. These counties had 56.7 percent of the nonwhite tenant farms in the State and accounted for 38.3 percent of the land in nonwhite-operated farms, 48.9 percent of the cropland harvested, and 54.4 percent of the value of land and buildings.

The 9 counties of Columbia, Conway, Hempstead, Jefferson, Lee, Monroe, Ouachita, Phillips and St. Francis had 5,357, or 46.7 percent of the total number of nonwhite owner-operated farms in the State. For these counties, the number of nonwhite owner farms ranged from 417 in Conway County to 776 in Jefferson County.

The term "nonwhite" includes Negroes, Indians, Chinese, Japanese, and other nonwhite races, but nearly all of the nonwhite farm operators in the State of Arkansas are of the Negro race.

A "farm operator," according to the census definition, is a person who operates a farm, either performing the labor himself or directly supervising it. Full owners own all of the land they operate. Part owners own a part and rent from others the rest of the land they operate. Managers operate farms for others and receive wages or salaries for their services. Persons acting merely as caretakers or hired laborers are not classified as managers. Tenant operators hire or rent land only. Croppers are tenants who pay a share only of either crop or livestock production or both and for whom their landlord furnishes all the work animals or tractor power.

Alpha Kappa Mu Members Enjoy Barbecue Party

Members of Alpha Kappa Mu Honor Society of A. and I. State College were honored with a Barbecue Party at the lovely residence of Mrs. Beulah Wilson, 39 N. Hill Street, Friday, July 11, 1947, at 5 o'clock. Serving as co-hostesses with Mrs. Wilson were Dr. Virginia S. Nyabongo, Miss Willa M. Coates, Mrs. Myrtle Russell, and Miss Rubirda Mitchell.

The spacious, rolling lawn which surrounds the attractive Wilson home presented an inviting picture and beckoned the guests out for participation in out-door games of croquet and horse shoe pitching. Those who preferred less strenuous entertainment played bridge on the shaded veranda of the house.

The aroma of barbecue permeated the air whetting the appetites of the guests who considered the supper hour the high point of the evening. When they were called to the beautiful, rock, out-door oven they found a delicious repast of barbecued ribs, potato salad on lettuce, rolls and cocoa Colas spread for their enjoyment.

Members who enjoyed this delightful affair were Mesdames Alma Dunn Jones, Mary Carter, Sabra Southall Conner, Lavinia Dumas, Leona Drane and Dorothy L. Stevens, Misses Ruby Prigmore and Louise Glover, Rev. and Mrs. B. H. Crawford, and Prof. Alger Boswell. Rev. Crawford, an out of town guest from Carruthersville, Missouri was visiting his wife.

Patricia and Donald Wilson, children of the hostess, assisted their mother in looking after the comfort of their guest.

Lecturer: "Can anyone give. the derivation of the word auditorium,"?

Listener: "Yes. From the word audi, hear, and taurus, bull. A place where you . . ."

Lecturer (interrupting): "That will do!"

Religious Week to be Observed Sept. 28 Thru Oct. 5

CHICAGO—Protestant churches of the United States and Canada are called upon to show their unity in the job of Christian teaching by observing Religious Education Week from September 28 through October 5.

Next to Christmas and Holy Week, Religious Education Week is the most widely celebrated church week in America. It is being observed this year for the seventeenth consecutive time. The theme is "Faith is the Victory-Spiritual Bases for One World."

Sponsored by the International Council of Religious Education, this special week will be noted by special services and activities in the thousands of churches, 40 denominations, and 634 state, provincial, county, and city councils of churches and religious education which cooperate in educational work through the ICRE.

"Religious Education Week is to develop in the church, in the home, and in the community an increasing consciousness of the importance of providing every child and youth with what is rightfully theirs, namely moral and religious training," Dr. Roy G. Ross, general secretary of ICRE, states. "We must teach for Christian Living. We must arouse our people to a deeper concern for moral and spiritual needs. To this end, let us demonstrate our unity in the task of teaching the demands of the Christian life."

In addition to local churches using this week to prepare and launch their fall educational program, Dr. Ross points out that many communities have events in which all the churches can participate.

"It is only as churches work together that they can begin to marshal resources to solve immediate needs of children, youth and adults," he declares. "This will unite the forces of all the churches in awakening the citizens of the community to the need and importance of Christian education in developing Christian character and Christian brotherhood__ so direly needed if we are to have anything resembling world brotherhood."

A Little Humor. . . Now and Then

The sweet young thing asked me if I could tell her how to play golf.

"Sure, it's easy enough," I told her. "All you do is smack the pill and then walk."

"How interesting," she replied. "Just like some auto rides I've been on."

On The Agricultural Front

Extension Supervisors Get Preview Of Mechanized Cotton Production

The advance of mechanized cotton production in the southwest was shown in two documentary films to 40 colored State Extension Service supervisors at their regional conference held recently at Prairie View A. & M. College, Prairie View, Texas.

Alfred M. Pendleton, gin specialist of the U. S. Department of Agriculture, presented the films as part of his talk on latest developments in the field of farm mechanization. One film showed the operation of the experimental flame cultivator and other devices for reducing the cost of chopping cotton. The other movie showed mehanical cotton pickers and strippers in operation on Texas farms.

Mr. Pendleton pointed out that while the mechanical pickers are still in an experimental stage, the mechanical strippers have proved their merit and are now being manufactured on a lare scale. He estimated that there may be as many as 5,000 strippers on Texas farms next fall.

USDA MAKES 27,000 PLACEMENTS OF VETERANS

Over 27,000 farm job placements of veterans of World War II have been made this year by the Extension Service farm labor program of thc U. S. Department of Argiculture, reports the Bereau of Aricultural Economics.

About 21,000 of these placements have been made as hired hands and 6,000 as tenants or sharecroppers. Some of these latter placements were of white and colored veterans who want to learn how to operate a farm before purchasing one of his own.

As for farm work as a whole, 11,394,000 persons were employed on farms on June 1, BAE reports. Of these 8.913,000 were operators and unpaid members of their families.

In the South, 90,000 fewer workers were employed on June 1 than on the same date a year ago, and over a million fewer than during the period 1935-39. Heavy rainfall was partly responsible for the reduction in the number of workers in the South. However, the harvesting of truck crops, the setting of tobacco, and the chopping of cotton are now getting well underway in that region.

West Indian workers make up part of the farm labor force. The Labor Branch reports that as of June 13, there weere about 5,000 Jamacians, 4,000 Bahamians. and 500 Barbadians employcd on farms. Approximately 2,500 of these islanders were working in Florida, 2,000 in Connecticut, 1,000 in New Jersey and the rest in the northeast and midwest.

CAMPBELL'S BOOK TO BE PUBLISHED IN ENGLAND

"The School Comes to the Farmer," autobiography of T. M. Campbell, Extension Service field agent of the U. S. Department of Agriculture, will be published in England next fall, according to an announcement now being distributed by Longmans, Green and Co. of London.

The London edition, which has a foreword by the late Dr. Jackson Davis of the General Education Board, is to be distributed throughout the British Empire. A special sales campaign will be launched in Africa where plans for the development of an agriultural extension program are being studied.

A large part of the autobiography is devoted to the movable shool, a wagon outfitted with tools to help teach farmers improved methods of farming and homemaking. The wagon was designed by Dr. George Washington Carver and was driven by Campbell for many years.

Alabama still maintains a movable school which has evolved into a motor bus, staffed by an agriculturalist, a home economist, and a nurse. This new enlarged school on wheels covers the rural areas of the State three or four times a year, supplementing the work of Extension Service agents and of Vocational Agriculture and home economics teachers.

Campbell's book was originally published by the Tuskegee Institute press in 1936.

ANDERSON FEARS FARMERS MAY GET HURT IN HIGH-PRICED LAND MARKET

Speaking before the recent Conference on Farm Real Estate Prices, Secretary of Agriculture Clinton P. Anderson expressed a fear that farmers loading themselves with mortgage indebtedness on high priced land may ultimately lose their farms and their savings. In part the Secretary said:

"Basically the picture today is this: Farm land prices have risen every year since the war began. Using 1935-39 average prices as a base, or 100 per cent, they were 103 per cent in the year of Pearl Harbor. Then in succeeding years they went up to 110, 120, 138, 152, 171. And now as of March 1, our latest report, they are 192 per cent of the prewar prices. The land prices rise in the last four years is greater than any comparable period on record. Average values in half the states are now above their post World War I peaks, and the average for the country as a whole is six percent of the 1920 record high.

"Not only have prices gone up, but the number of sales has gone up too. Those are thc two essential elements of a land boom--increasing prices and increasing number of sales. During each of the past four years the number of sales has been threc-fourths or more greater than prewar...

"During recent years our farmers have been taking advantage of their good incomes to pay off old mortgage debts and improve their financial position. In spite of the increasing land inflation, the total farm mortgage debt went down year after year. But during the first half of last year this trend changed and the mortgage debt started up. This fact, combincd with the still rapidly increasing short time indebtedness of our farmers, may constitute a real danger signal...

"Somewhat more farmers have been buying farms than selling, so that there has been a net movement of land into farmers' hands. This trend was quite pronounced in the early war years when local government and credit institutions were unloading land acquired during the depression. The trend is now rapidly slowing down. Whether the trend has strengthened or weakened the structure of American agriculture depends, of course, on the terms under which the farmers bought. Tnough an increase in farm ownership is generally desirable, there is nothing good about a farmer loading himself down with a mortgage indebtedness that may some day take away both his farm and his savings..."

REA MOVE MAY MAKE MORE PHONES AVAILABLE TO RURAL FAMILIES

The Rural Electrification Administration is helping to make possible the extension of telephone and electric service into more rural areas by working out a contract arrangement with the Bell Telephone System whereby joint use of poles will be approved.

Announcement was made last week by Administrator Claude B. Wickard of details of standards contracts which REA will approve for any of its borrowers wishing to enter into an agreement with a loal telephone company for joint use of poles.

REA officials point out that while approval of these contracts does not in itself assure telephone service to REA consumers, it is a helpful start toward extending both telephone and electric service to many rural families that are not now being served.

Administrator Wickard says:

"That real opportunity exists for the extension of telephone service through joint-use of power facilities is borne out by the last census which showed that 1,385,000 farms had electricity but no telephones, whereas there were only 464,000 farms which had telephones but no power. There are nearly 1,000 REA-financed electric cooperatives operating more than one-half million miles of power lines in the rural communities of 46 States. Loans have already been made to increase this figure by more than 250,000 miles."

SYNTHETIC FIBERS INCREASE AS COMPETITORS OF COTTON

Synthetic fibers other than rayon. in their infancy before World War II, are becoming increasingly important in the texile economy of the United States, according to a survey just made at the United States Department of Agriculture's Southern Regional Research Laboratory.

Until about 1935, rayon (synthetic fiber made of cellulose) was the only manufactured fiber in commercial production in this country. Its production was started in the United States in 1911 and has increased so steadily and rapidly that as a textile fiber rayon now ranks second, quantitatively, only to cotton, with consumption inreasing from 482 million pounds in 1940 to 875 million pounds in 1946.

The survey, which was made in connection with the research program on cotton utilization, shows that consumption of all noncellulosic synthetic fibers (or synthetic fibers other than rayon) has increased from 4.5 million pounds in 1940 to 53.3 million pounds in 1946. Although even the latter quantity is small as compared with the amounts of cotton, rayon, and wool consumed, it is already greatly in excess of the consumption of silk or flax.

STILL TIME TO PLANT GARDENS

Home gardeners who have delayed plantings because of adverse weather conditions are urged by Paul C. Stark, director of the National Garden Program, to proceed with their plans as soon as possible. There is still time to plant most vegetables, and successive plantings can be made throughout thc summer, he says.

PIG CROP

The 1947 spring pig crop totaled 53,151,000 head, an increase of about 1½ percent over last year, the Bureau of Agricultural Economics reported. The number of sows farrowing this spring was 7 percent above the number last spring... The combined 1947 spring and fall pig crop is expected to be about 85.7 million head—3 percent above 1946 and about 1 percent above the average.

TRUCK CROPS

Aggregate production of spring season commercial truck crops for the fresh market is estimated at 1,813,000 tons by the Bureau of Agricultural Economics. The indicated total spring tonnage is about one-eighth less than last year but about one-sixth above average.

U. S. Bonds Sales In Davidson Co. Total $6,899,677.

Total sales of U. S. Savings Bonds in Davidson County during the first half of 1947 amounted to $6,899,677.25 it was announced today by Basrom Jones. Davidson County Chairman for the U. S. Savings Bonds Division.

In achieving this total sales figure, Davidson County fell short of, its assigned sales objective for the period of approximately $1,020.322-.75

A semi-annual report from State Dirccter John Lovell in Nashville, indicated that total salcs in the State for the first half of 1947 amounted to $41,007,378.60, of which 60 per cent was in Series E Bonds. This figure constitutes 52.91 per cent of the minimum sales objective assigned Tennessee for 1947. A necessary monthly sales average of slightly more than 6 million will have to bc achieved in the last half of this year if Tennessce carries its assignment, Mr. Lovell concluded. However, with Payroll Savings holding a remarkably even level and with the new Bond-A-Month Plan growing in favor with Bond purchasers across the State, this objective should be reached if the present pace is maintained.

"Fair Employment" Practices Big Help To Jackie And Dodgers, Too

Southerners who believe in fair employment practices, and who agree with Mrs. Eleanor Roosevelt's contention, that race prejudice in the matter of employment is depriving the nation of much valuable talent, have no reason to be ashamed of what has come from the most notable experiment in 'fair employment" made in 1947.

That experiment was in the case of hiring a colored baseball star as a Major League player. Specifically, it was the signing of Jackie Robinson by President Branch Rickey to play first base for the Brooklyn Dodgers. Jackie has played so well, and what is even more important, has been such a terrific drawing card in every city where he has played, that other major league moguls are rushing hither and yon looking for colored talent.

Persons who confine their reading about baseball to the small papers of this area cannot possibly get a fair picture of the playing prowess of Jackie Robinson. The small dailies give only brief stories of major leagues games, in the first place and, in the second place, tradition demands that they "play down" rather than play up any competitive achievements of Negroes lest they make a contribution to the bringing on of "social equality," to hear the advocates of "unfair" employmcnt practices tell it.

Many persons hereabouts are buying the big daily papers that are sold here. They are able to get a big New York Sunday daily for the same price paid for a local daily, which is 15 cents. And so the big dailies are being perused eagerly these days to see how Jackie Robinson stacks up among the other National League stars, and to see what it is that is making him just about the biggest drawing card in organized baseball this year.

A study of the NEW YORK TIMES for Sunday, July 20, which was on sale in Nashville, Monday of this week, supplies interesting data on Robinson as it does on other stars. For one thing, on Page 3 of the Sports Section, there is a remarkably good picture of Jackie's exploit of stealing home, as his part of a double-steal negotiated by Dixie Walker, Brooklyn right fielder and Robinson. In the July 19 game, Walker was on first base and Robinson was on third. This is a play that is seldom attempted and still less seldom executed. But there is Robinson getting away with the hardest part of the double steal and the explanation under the picture says:

"Robinson has slid across the plate to complete a double steal with Walker in the first inning. Catcher Rice (of St. Louis Cardinals) has the ball but is too late for the play as (Umpire) Reardon calls the runner safe."

That Jackie Robinson is no "flash in the pan" sensation, such as many thought he was at first, the batting averages in the New York TIMES clearly disclose. Some facts from these averages are as follows:

Up to Saturday of last week, Jackie Robinson had a batting average of .310, which he had amassed in a total of 85 games. Among 102 players whose averages were given, Jackie's position was 13th. He was only one percentage point below Johnny Mize the home run king of the National League. He was the leading batter on the Brooklyn team among those who had played 70 or more games this year. Only Vaughn, who had played only 39 games, had a better average (.320) than Jackie, among the Brooklyn players.

There is quite a list of baseball celebrities who do not own as high a batting average as Jackie, and in one particular, Jackie is far out in front of any other player in the National League—which is in the number of bases stolen. He has 14 to his credit. In the American League, Dillinger of the St. Louis Browns with 23, leads all base stealers, and Philley of the Chicago White Sox has 14 to his credit, to tie Robinson. These three are the only players in the two major leagues who have stolen 10 or more bases.

The record shows Jackie had been at bat 332 times, had brought in 73 runs and was second only to Johnnie Mize of the Giants in runs scored. Robinson has made 103 hits this year. Only Baumholtz of Cincinnati has made more (107) than Jackie in the National League. Kell of Detroit and Joe DiMaggio of the Yankees, in the American League, have hit safely 104 times, only one time more than Robinson. Or in other words, among 204 players in the two major leagues, there are only three who have collected more base hits than this colored boy in his first year in the majors.

Jackie's success in scoring, of course, is attributed to the fine team spirit of the white players on the Brooklyn team. They daily are in there trying just as hard to drive Jackie in when he is on the base paths as they try for any of their other mates.

There is no coolness toward Jackie either on the part of his own tcam mates or the other players of his league. He has deported himself as a great sportsman, as well as a colorful baseball player.

Up to the past week, Robinson was outbatting such noted National League stars as Hank Greenberg, Slaughter, Musial and Medwick of St. Louis; Cavaretta and Bill Nicholson of Chicago, and many others.

Brooklyn which boasted a 5-game lead on Wednesday of this week, was getting that pennant fever and Jackie Robinson was as badly afflicted with it as any of the other boys.

In the meantime, around the local barber shops, the debaters, who had already switched from Truman to Dewey, are now saying Mr. Branch Rickey is the best man to have in the Prcsident's chair, right through this gap.

USDA To Buy Mules For Mexico

The U. S. Department of Agriculture has announced that a program under which mules will be purchased for the Mexican Government will be initiated at once. The purchases are being undertaken as a service to the Government of Mexico and will be on a completely reimbursable basis.

The mules obtained under this program will be used to replace work oxcn which are being destroyed as a part of the foot-and-mouth disease eradication campaign in Mexico. The Livestock Branch of the Production and Marketing Administration will carry out the purchase operations of the program for the account of the Mexican Government. While final arrangements have not been made as to the number of animals to be purchased, the initial plans indicate 20,000 or more.

Pooled Cotton Proceeds To Be Distributed

The U. S. Department of Agriculture has announced that the Commodity Credit Corporation will begin immediately a pro rata distribution of $6,183,388.25 among 393,359 cotton growers who have a financial interest in the proceeds from cotton which the Corporation pooled from the 1943 crop.

Upon completion of these payments, the CCC expects to begin distribution of the proceeds from the 1944 and 1945 crop pools, probably by the end of September this year.

THE FORUM

The Modern Farmer

Published monthly by the Modern Farmer at Nashville 3, Tennessee.
Giles A. Hubert,_____
_____ Contributing Editor
Sadie Wilson _____ Secretary
Henry Allen Boyd_____ Publisher
Office, 403 Charlotte Avenue.

Devoted to the interests of the Farmer, Truck Gardner, Livestock and Poultry, Breeder, the Home and the People.

Entered as Second Class Matter, April 10, 1929, at the Post Office at Nashville, Tenn., under act of March 3, 1879

All contributions for publication in the Modern Farmer, should be addressed to The Modern Farmer, 403 Charlotte Avenue, Nashville 3, Tenn.

No libelous matter will be published. Unsigned articles or letters, and those written on both sides of the paper will not be used.

Subscription price $1.00 per year, 75c for six months, payable in advance. Personal checks must be certified. Make all checks or money orders payable to The Modern Farmer.

Advertising rates and sworn circulation figures presented upon application.

Byrd's Nest

(Continued from Page 7)

workings of the people connected with the visible christian church: there is a sufficient amount of gospel-preaching in the world to save the world. With only a few exceptions, there are no places where the gospel of Christ is not being preached. Along with the preaching of the gospel is, in some places, regular teaching of the word of God and in others. occasional teaching of the word. People who do not know Christ, live in darkness. It may seem strange the people live next door to the brilliance of gospel truth and yet stumble in the shadows of sin and retrogression. All of the darkness is not confined to the un-churched people of the world, for many so-called leaders in the field of religion are in the darkness of Divine principles in action. To know that one must love his fellowman, does not bring him into the light: he remains in darkness until he begins to practice the divine principle which he has been taught. The woman of Sychar knew that a Messiah was coming, but never saw the light until she was willing to set aside her racial narrowness and converse with a Jew down by Jacob's well. We may conclude that theory reddens the Eastern skies of Truth and fact, but practice reveals the light. The more light we have, the better we practice, and the more we practice, the brighter the light shines.

Pleas Orr' Young

(Continued from page 1)

hired men use tractor power to do most of the work on his cotton farm.

Farmer Orr owns three tractors and uses no workstock at all on his farm. And he plans to cut down on the cost of chopping his cotton this year by using a mechanical cotton chopper he has just purchased. Also he is considering buying a mechanical cotton picker as soon as the local gins in his area become equipped to clean and gin mechanically picked cotton.

Dr. Otis points out that the number of tractors in Alabama has increased considerably since 1940. He

(Continued from page 1)

farm men with some of their tobacco, hay, and livestock production problems. And in addition to her demonstration work, through the years Miss Carter has associated herself with all of the health, public welfare, and general improvement programs operating in the county, raising funds and helping to make more of these services available to both rural and urban people.

Miss Carter received her training at Virginia State college and at Hampton Institute, and was named colored home demonstration agent in Amherst county in 1921. Prior to assuming this position she was for 11 years a school teacher in the county.

Home Food

(Continued from Page 1)

Department officials point out that abundant supplies of home and commercially grown fruits and vegetables will be available during the summer and fall for preservation at home and in community canning centers.

Sugar supplies available for canning will be larger this year than last. Homemakers will receive at least 35 pounds of sugar for each member of the family for household and canning use. This compares with a total of only 25 pounds last year for all uses.

Two Concepts Of Medical Care

The American people must choose between two diametrically opposed systems of providing medical care. That was the gist of a recent address by Dr. Harrison H. Shoulders, president of the American Medical Association.

One system, Dr. Shoulders said, "would vest in some agency of the Federal government the power to tax, the power to spend, the power to regulate, the power arbitrarily to determine need. . .and finally the power by regulation to direct... That proposition has its origin in a totalitarian philosophy of economics and can lead but to tyranny."

The other system, he then said, "is the application of the principle of insurance through voluntary prepayment medical service plans to the financing of medical care. This will solve the major difficulties in the financing of medical care. The sound and wide application or use of insurance will spread the most in two directions--over a large group of people and over a long time. This proposition has its origin in the philosophy of freedom. It is purely voluntary. It will make medical care easily available to people of all income levels. . . It will preserve the freedom of the individual."

There might be some argument for government-dominated medicine if prepaid, voluntary, medical care plans had failed. But they have grown with remarkable rapidity in late years. The extent of the services offered has steadily been enlarged. The cost is very low and the worker' entire family can be covered. They offer a sound solution to whatever general medical care problems the country faces.

ONE LETTER MAKES A DIFFERENCE!

"Elderly Couple, that have part income, wanted to do chorus on small farm. — GRAND RAPIDS (Mich.) PRESS."

"After refreshments were served on the beach, Mr. Gerson took the children aboard his trim paunch for a ride on Lake Erie.—ELMORE (Ohio) SCHOOL NEWS."

"A neighbor, Jed Hill, said that if he had not snatched the bun out of the young woman's hand, she probably would have killed her

Ranger, A New Snap Bean, Offers Several Advantages

By Dr. Floyd Bralliar
Garden Editor, The Nashville Tennessean

We have scarcely emphasized some of the novelty vegetables so far this season. One reason for this has been that seeds are scarce and hard to get. But we feel that we should say something at least about some of the new and comparatively new beans. Last year's All-American selections granted a bronze medal to an entirely new snap bean, named Ranger.

It has several outstanding features that make it valuable. It is distinguished from all others by its unusual habit of growth, disease resistance and its high yield. A prolific, vigorous grower, it is resistant to the common bean mosisac. downy mildew and some forms of rust. Pods are five inches long and the beans are ready for picking in about 56 days.

We might have not mentioned this bean at this time but for the fact that it is also said to produce plenty of beans during the hot summer time. We are not urging anyone to go to the expense of planting a large area of these beans, but it is worthwhile to plant a small patch, for all of the new beans brought out recently have proved to be distinctly better than the old varieties.

A Heavy Producer

Another of the winning novelties is Erie Sweet Corn, an especially strong grower and a heavy producer of high quality yellow roasting ears. We are not especially advocating this variety of sweet corn, but this is the proper time to plant corn for the late crop of roasting ears.

We strongly urge those who grow their own roasting ears to establish the habit of growing sweet corn. The old sweet corns were not so resistant to disease nor so hardy to changeable weather as is the ordinary field corn, but the new hybrid variety of which Erie is one, are as sturdy and resistant to disease as most field corns. They will produce roasting ears ready to eat in from 50 to 60 days after the seeds are planted and few people who eat the new hybrid varieties of sweet corn will want to go back to the old field. Sweet corn should be planted and cultivated just as we plant and cultivate any other corn.

Use Fertilizer Freely

For years we have advocated the freer use of fertilizers of all kinds on our crops, and esecially on our garden crops. We wish to mention this again at this time. To get maximum results with the least effort from any crop include a complete plant food in your growing program.

Ths is probably more important in spring planting than it is now, but in planting any new crop if it is at all possible you should not only turn under any green material to produce humus, but it usually pays to use a little commercial fertilizer at the same time. Usually it is better to use a complete commercial fertilizer than one that contains just a few elements.

Where vegetables are to be planted in rows, it will almost always pay to lay off the rows several inch deeper than you expect to plant the seed. Then apply two pounds of good complete commercial fertilizer to every 100 feet of row. This fertilizer is sown in the bottom of the trench and should be covered about two inches deep with soil before the seed is planted. If the soil is poor, it will pay to apply an equal amount of fertilizer divided between two trenches about three inches to each side of the row. These rows should be two or three inches deep.

Transplanting

We are also frequently asked

order to get either extra large fruit or an abundance of it. When transplanting seedling plants of any long-growing crop mix a level tablespoonful of fertilizer thoroughly with the soil in the bottom of the hole and cover with one inch of soil before setting out the plants. Then work a teaspoonful of this same fertilizer, in with the soil around each of these plants, in about six weeks, and again in about four more. It is better where it can be done to apply this fertilizer just before a rain, or soak the soil with a hose immediately after applying the fertilizer.

For vine crops grown in hills, such as cucumbers, and melons, mix a level tablespoonful of plant food thoroughly with the soil in the bottom of the hill and cover with one inch of soil before planting the seeds.

Then just as these plants start to make vines, work about a level teaspoonful of fertilizer in the soil about four or five inches away from these hills. Care must be used in doing this, because vine crops are shallow rooters and are already making an abundance of roots by the time the vine starts to grow.

Some may wonder why we especially mention the care of vine crops when they should either have been planted 3 or 4 weeks ago or should not be planted for another two weeks. We admit that cucumbers should have been planted three or four weeks ago or should not be planted yet, but this is not true of most other vine crops. This is an excellent time to plant acorn squash, butter-cup squash, Zucchini summer squash, and other similar crops.

Correct Storage Saves Nutrients In Vegetables

If the family is to get the most in health value from food, the housewife must avoid not only the obvious waste that shows up in a full garbage pail, but also the more subtle waste of nutrients from keeping food improperly or too long. This suggestion from nutritionists of the Minnesota Experiment Station is based on studies of nutritive losses, especially of vegetables.

The scientists point out that the wrong storage of vegetables in the home results in considerable loss of nutrients. Studies show that such vegetables as peas, broccoli, cauliflower, lettuce, spinach, endive and kale lose vitamin C rapidly at room temperature—as they stand and wait on the kitchen table, for example, or are kept in an open bin in the kitchen. In the refrigerator the loss takes place much more slowly.

Keeping vegetables too long also causes losses. Although vitamin A is not so easily lost as C, even this vitamin gradually disappears from green vegetables if they are kept too long. A study of lettuce shows that its vitamin A value 'drops markedly when kept too long in the refrigerator, the rate of loss corresponding with the amount of wilting.

Many housewives do not realize that leftover cooked vegetables also lose value as they stand. Although it is thrifty practice to save and use all leftover food, it is thriftier to plan so that vegetables will all be eaten at the meal with none left over. Studies show continuing losses in vitamin C in leftover foods kept in the refrigerator, the amount depending on the length of storage. Uncovered foods in the refrigerator lose more than covered foods.

Client: I want you to draw up my will, but I don't know just how to word it.

Lawyer: You needn't worry--just leave it to me.

Client; Yes, I suppose that's how it will turn out anyhow.

Moisture Is Vital To Lovely Complexion

By Betty Clarke

Your skin is going to stay young and healthy only by what it is fed inside and out.

As we grow older we realize that one of the ways to keep the skin young looking is to keep it narmal. It should never be too oily nor too dry.

Most of us have a tendency to sun ourselves too long—often to the point of "baking" the skin. While it is good for the skin to get occasional sun baths, too much sun, it is believed, is worse than too little.

Notice how pretty your skin looks on a damp or rainy day and how pretty the complexion of the British girl who lives in a damp climate, and you will realize that what your skin needs perhaps more than anything else is moisture.

As a woman grows older she loses the moisture in her skin and it lacks the young, dewy quality she had in her teens.

It is when the skins dries that wrinkles appear. It doesn't seem fair that women, to whom youth and beauty are so precious, are far more subject to wrinkles than men. But because they have less muscle padding under the skin, it is softer and more inclined to get flabby.

So it behooves every woman when choosing her cosmetics never to use anything that will dry the skin, but rather to use something that will add moisture to the skin.

Duke Ellington Spotlighted by Look Magzine

New York—Duke Ellington is described as the prime influence in a quarter century of American jazz in a lengthy review of his life and accomplishments appearing in the current issue of Look magazine. "There can be no doubt that he is the most important all-round figure in jazz," LOOK writes, stating that he has consistently headed the greatest jazz band of his time.

The typical American success story of the Duke's early struggles and final achievement of fame and fortune through hard work and merit are told fully in the article. Born Edward Kennedy Ellington, son of a Navy blueprinter, in Washington, D. C. the Duke could not decide in high-school days whether to follow his father's footsteps as a commercial artist, or to study music. Fortunately for the world of muic, his talents as a composer began to take shape as early as his senior year. His first composition, "Soda Fountain Rag", was inspired by the Poodle Dog Cafe where he worked as a soda jerk after school.

The Duke formed his first band, The Washingtonians, in 1917. He and his friends, Otto Hardwicke, and Arthur Whetsol, "starved genteely for a while," according to Look, and the Duke conducted a sign-painting business on the side to keep going. Their real success began when they were booked at Cotton Club in 1927, where they became a national institution during their five-year engagement at this famous night-spot of the twenties.

Other musicians who have helped make the Ellington band outstanding through the years are also accoladed by Look. They are: Cootie Williams, Barney Bigard, Ben Webster, Rex Stewart, Sonny Greer, Harry Carney, Johnny Hodges, Lawrence Brown, Taft Fordan. Freddy Guy, and the Duke's ar ranger, Billy Strayhorn.

Office Boy: "Are you a salesman, bill collector or a friend of the boss?"

Caller: "All three."

Office Boy: "Well, then, he's at a

Economic Highlights

Happenings That Affect the Dinner Pails, Dividend Checks and Tax Bills of Every Individual
National and International Affairs Inseparable from Local Welfare

It is an indication of the state of the world today that every time someone makes a suggestion for world disarmament, it is received respectfully--but with complete pessimism as to the possibility of achieving it. No sane man can help but be appalled by the cost of the world's present military establishments, or by their obvious threat to a prolonged peace. But the hope that something tangible can be done to cure this--a hope that was held high at the end of World War I--is almost totally lacking now. The truth is that the world is actively engaged in an armament race which is of an unprecedented character.

In the last war, there were only two major new weapons--the atomic bomb and the German guided missiles. All other weapons simply represented developments of lethal instruments which had long been in existence and involved no revolutionary principles. Some basic weapons, such as the rifle, have been essentially unchanged in generations. And even a block-buster is simply an evolutionary advance on the small aerial bombs of the first war.

Today's armament race does not follow the classic pattern of attempting to produce and store more standard weapons than the competing nations. Its emphasis is largely on new weapons. As a consequence, much of the race is being run in the laboratories--rather than in the munitions factories.

This, of course, is particularly true of atomic weapons. Our atomic bomb plants are still going at full capacity, and the work being done is as completely shrouded in secrecy as in wartime. The Russians are known to have put a number of the leading German nuclear physicists to work on atomic research, and to have given it number 1 priority among their own scientists. No one outside of Russia knows just how much progress has been made.

It would be a grave mistake, however, to let the terrible potentialities of atomic power blind us to other possible innovations in the bloody art of warfare. Our own Army has been carrying on extensive experiments with guided missiles, using the seized German equipment, and other Armies are unquestionably following suit. This is one of the most ominous weapons yet devised, and some experts believe that had the European war lasted another year or so, German technicians might have been able to develop it to the point where it would have crushed England. When the latest type of bombs appeared, England established a strict censorship to keep knowledge of the damage done from becoming known to the world. These weapons were particularly terrifying in that their speed was so great they outran their own sound. Thus, the explosion took place before the missile was ever heard. What kept them from becoming a decisive factor was their inaccuracy. They could be aimed to hit a section of a city--but they could not be controlled with sufficient accuracy to strike a particular target, such as a power plant or an arsenal. Present efforts are directed at perfecting the guiding equipment and giving them the accuracy of artillery.

Pilotless aircraft, controlled by extremely advanced radio equipment, is another subject of intensive research. Planes are infinitely cheaper and more abundant than crews--at the end of the last war we were producing aircraft much more rapidly than we could train men to man them. If a truly efficient and reliable pilotless air force could be developed, the deadliness of war in the air would be multiplied manyfold. Enormous fleets could be sent against enemy targets, and the losses would be in material, not in men.

At intervals there is discussion of the possibilities of bacteriological warfare. Even in the first war is was rumored to be impending, though nothing came of it. The problems in the way are enormous--foremost among them being some means of protecting the user's own

Again, means of distributing bacteria may be an unsolved problem. But in these days, when science seems to be on the verge of outdistancing the ability of man to control it, no innovation can be considered impossible. And no one can believe that in a war of extermination, any belligerent would let moral scruple stand in the way of the employment of any killer.

A little news has seeped out concerning the U. S. War Department's plans in the event of another war. The atomic bomb has made it necessary to plan on the widest possible decentralization of authority--if one city or a dozen cities were wiped out, there would have to be a super command post ready to take over elsewhere. There has been much serious discussion of putting certain essential industrial plants underground, either in natural or constructed caves. The cost of this would be incredible--but no one yet seems to have devised any other defense against the A-bomb.

Perhaps the almost inconceivable destructiveness of weapons now being developed will, in the long run, be an assurance of peace--for the simple reason that another war might literally mean the destruction of civilization. General Eisenhower touched on this vividly, when he said: "The earth may become a flowering garden or a sterile desert--and we may make the difference."

It will certainly not come as a shock to newspaper readers to be told that the great postwar spending boom is but a shadow of its former lusty self. It has tapered off in almost all lines, and in some fields it has practically come to a halt. Many of the present speculations of economists deal with the question of whether we are approaching a depression or a recession--the latter being, of course, a sort of midget-size depression. Opinion on this runs the whole gamut, from the optimists who think business and employment will hold at high levels after certain "corrective readjustments" are made, to the pessimists who forecast darkly that what is coming will make the '30s look like giddy prosperity.

Regardless of the guesswork, some of the economic facts of the time are worthy of sober thought. One of the best summings-up recently appeared in Wall Street Journal, under the by-line of a staff correspondent, Vermont Royster.

Mr. Royster, whose sources are largely governmental, starts out by observing that "the nation's families are going back to the old American custom of living off next week's paycheck". What this means is that the cash buyer, whose name was legion during and immediately after the war, is becoming harder and harder to find. During 1946, consumer credit increased by $2,400,000,000. In March of this year installment credit alone jumped $70,000,000 and was 65 per cent higher than in the same month in 1945. In other words, the American family is returning to the little down and a long time to pay system of buying what it wants.

As is to be expected under these conditions, savings are dwindling. According to Mr. Royster, nearly half of the $25 government bonds purchased in 1945 had been redeemed a year later, and the rate seems to be increasing. And where, in 1945 the nation's families were saving nearly 24 per cent of their income, the rate has slipped down to 10 per cent--about where it was in 1940. It is highly significant that this has occurred in spite of wage increases for most workers, and indicates just how tough the rise in the cost of living has been on the typical family.

The volume of business is showing signs of suffering from these trends. As is to be expected, businesses of the luxury character have been hardest hit so far. A long time ago the night clubs and the taverns began to feel a pinch. Amusement enterprises have been subjected to the bleak wind of declining patronage. And now semi-luxuries are facing a steady drop in purchasing.

In more staple lines, business is still good, but there are clouds on the horizon. Production is rapidly making up the backlog in the majority of lines, and has more than caught up in some. Retailers are buying much more carefully than

warehouses and on the shelves of stores. Once hard-to-get items--men's shirts and nylon stockings are good examples-- are now in almost super-abundance.

Mr. Royster says that 'the 'building boom, counted on to take up the reconversion slack, has failed to live up to expectations." This was one of the great fiascos of the postwar economy. The experts confidently figured that millions of homes and other residential units, to say nothing of a vast amount of industrial construction, would be needed. It may still be needed--but people just won't pay the current prices if there is any way to avoid it. Many a returning veteran who thought in terms of the kind of home you could buy in 1940 for eight or ten thousand dollars found that an equivalent home cost twice that and often more. His GI loan wasn't sufficient to finance the kind of house he had pictured in his mind's eye, and his income wasn't enough to make the monthly amortization payments. So, if he could find any kind of a place to live, he didn't build or buy. Trouble ahead is forecast for ambitious residential sub-divisions where the costs of the houses and other developments outran the estimates by an incredible amount. On top of that, many people, including GIs, who did buy on small down payments, have given up and are letting the properties go. They simply can't afford to pay for and maintain them.

Mr. Royster says the unemployed now total 2,400,000 people. The trend is up--though not alarmingly so as yet. The Bureau of Labor Statistics now concedes that the number of workers gainfully employed this summer will be below earlier predictions. This is inevitable in the light of conditions.

Some producers, such as the motor-car companies, still have big backlogs of orders, and sales are no problem. But that doesn't mean that everything is rosy. Manufacturers and dealers are definitely worried as to what will happen once the backlog is wiped out. Many a prospective buyer has shaken his head at sight of the price tags on the new cars. Thousands upon thousands of orders have been cancelled.

What it all adds up to is that the basic cost of just plain living is absorbing most of the average family's income, and it has less and less left for other things. That is the growing problem we have not yet been able to solve.

Furniture Workshops Aid Rural Women

Hundreds of furniture workshops are now being held by colored home demonstration agents in the Southern States, according to reports received by thee U. S. Department of Agriculture from State Extension Service directors.

Not only are farm women being shown now to paint up old furniture, put new bottoms in chairs, and make furniture covers, but also they are being shown how to reupholster chairs and divans at only a small fraction of what it would cost to have it done.

The women are taught the whole upholstering process, from making webbing stretchers and putting on webbing to tying springs and recushioning furniture with moss or cotton. Four-H club boys and girls also are taught how to repair and rebuild furniture. Home demonstration agents say that the furniture workshops are going a long way toward improving the appearance and comfort of rural homes.

Scores of pieces of reupholstered furniture will be placed on exhibit at Achievement observances in the fall. Along with the redone furniture will be displayed pictures of it before repair work was begun.

Resume Cotton Insurance Payments

Payments on 1946 cotton loss claims under the Federal Crop Insurance program were resumed on May 18, the U. S. Department of Agriculture has announced. These payments were discontinued on March 11 because funds for this part of the insurance program were exhausted. Resumption of payment was made possible by

Colored Extension Supervisors Urged To Broaden Scope Of Program

Washington, D. C.—June 25, 1947

The need for broadening the scope of agricultural extension work beyond the cow lot and the field and for placing greater emphasis on helping farm people to improve themselves and homes as well as their farms claimed the attention of 40 Negro Extension supervisors from 13 States at their five-day regional conference held at Prairie View A. & M. college, Prairie View, Texas, recently.

T. M. Campbell, co-chairman of the conference sounded the keynote in his opening remarks when he told the supervisors "we are skimming high and failing to serve many farmers in the lower brackets."

The conference was held for the purpose of further improving the supervision of county farm and home demonstration agents to the end that farm people may be better served. This was the third such conference to be held within the last two years.

Principal conference speaker was H. H. Williamson, assistant director of Extension Service of the U. S. Department of Agriculture. He reviewed the history of extension work, pointing out that in this new postwar era of extension, the scope of the work must be broadened beyond the cow lot and the field. "It doesn't make sense," he said "to see a lean, stoop-shouldered 4-H boy leading a fat healthy calf at a stock show."

The assistant director called on the supervisors to re-emphasize to their agents the importance of serving not only the farm, but the farm family as well. He urged that they seek to raise the whole level of living in their States--for little farmers as well as big ones. "You can't fill a keg any higher than the shortest stave," he declared.

The short staves were compared to the little farmers down the ladder. "The level of living in a community cannot be raised until these short staves are lengthened," he said.

Williamson criticized one-crop extension agents as well as one-crop farmers. He described one-crop agents as those who spend most of their time on any single extension activity--sewing, canning, poultry raising, gardening, dairying, or inoculating livestock. "There is no difference between such agents and farmers who devote most of their acres to cotton or tobacco. What we want is balanced farming and balanced extension activities," he said.

Among the other conference speakers were: Dr. E. B. Evans, president of Prairie View, Director H. C. Sanders of Louisiana, Director I. P. Trotter of Texas, Associate Director A. D. Gates of Arkansas, Assistant Director L. A. Dhonau of Arkansas, Frank Boutwell, Texas State health specialist, T. M. Campbell and John W. Mitchell, Extension Service field agents, Alfred M. Pendleton, USDA gin specialist, and Sherman Briscoe, USDA information specialist.

Supervisors in attendance at the conference were: Alabama, Dr. J. R. Otis, Miss M. F. Myhand, Mr. W. B. Hill, Mr. C. C. Lanier, Miss R. L. Rivers, Mr. T. R. Agnew, Miss M. B. Hollinger, and Mr. C. E. Trout; Arkansas, Mrs. Fannie Mae Boone, Mr. T. R. Betton, Mrs. Ella P. Neely, and Mr. L. L. Phillips; Florida, Miss Floy Britt; Georgia, Mr. P. H. Stone; Louisiana, Mr. T. J. Jordan, and Mrs. Ruby F. Hinton; Maryland, Mr. Martin G. Bailey; Mississippi, Mr. M. M. Hubert, Mr. G. C. Cypress, Mrs. Daisy M. Lewis, Mrs. Beatrice Childress, and Mrs. Alice Carter Oliver; North Carolina, Mr. R. E. Jones, and Mrs. Dazelle F. Lowe; Oklahoma, Mr. Paul O. Brooks, and Mrs. H. M. Hewlett; South Carolina, Mr. E. N. Williams; Tennessee, Mr. W. H. Williamson, and Miss Bessie L. Walton; Texas, Mr. W. C. David, Mrs. P. R. Brown, Mr. H. S. Estelle, Mrs. J. O. A. Conner, Mr. J. E. Mayo, Miss M. E. Garrett, Mr. W. H. Phillips, and Mr. M. V. Brown; Virginia, Mr. Ross W. Newsome, Miss B. D. Harrison,

Garden Peas Make Good Food, Help Enrich Soil

By Dr. Floyd Bralliar
Garden Editor, The Nashville Tennessean

The time was when practically every Southern garden contained blackeyed peas and if not, it had plenty of crowder peas.

For some unfortunate reason this is no longer true. We say unfortunate for not only are these peas high quality food but the growing of them not only enriches the soil but loosens it and puts it in better condition for other crops.

This is doubly true if the tops are turned under in the fall and the ground soil sowed to some winter cover crop. There are few vegetables that yield a heavier crop over so long a period of time or that may be eaten either green or ripe, as the cowpea, and of course both blackeyed and crowder peas are cowpeas.

We might have planted these peas earlier, but now is probably the very best time to plant them. Probably the crowder peas bear a larger crop and are better liked than the blackeyed varieties, but all are always in demand and both are easily grown.

Plant in rows fully three feet apart. It is better to plant the crowders four feet apart for they make an abundance of vine and set fruit better if they are not too crowded. The peas may be dropped as close as three or four inches apart in the row, though we think they do better planted a little further apart. Do not cover the seed more than inch or two deep. Keep them clean of weeds until they make vine enough to smother any weeds that try to come up. Pick all pods as soon as they are ready for using as green peas, and the vines will produce longer. If the peas are allowed to ripen the plants are likely to quit growing and setting on more peas.

Transportation In The Future

Some time ago, in replying to a questionnaire in connection with the National Transportation Inquiry, the Railway Business Association recommended that transport coordination should be extended further by a regulatory policy which will assure competitive equality between various forms of common carriers; that all commercial carriers be permitted by law to operate other forms of transport within reasonable territorial limits, and that all commercial carriers should be placed under regulation by a single government agency. These recommendations were approved by a large number of newspapers, and by exerts on the transportation question.

It would seem that some such doctrine as this must underlie our future transportation policy if the carriers are to keep abreast of the needs of the nation. The time has long passed when any carrier could be correctly regarded as a complete entity, not connected with other forms of transportation. This is literally a horse-and-buggy concept of the transportation machine. Nowadays it is commonplace for both passengers and cargo to use rail, water, air and highway carriers in the course of a journey. Each offers special and valuable services, all of which are interrelated.

Regulation by a single agency, such as the Interstate Commerce Commission, is the only logical course. There is no need for duplicating regulatory commissions, with their resultant confusion of decisions. Furthermore, only a single regulatory body, with jurisdiction over all the carriers, could establish policies which would apply fairly and with equal weight to all.

Coordination of transportation is a long-term program, on which Congress should begin work at the earliest opportunity. We mut have a policy which is geared to the complex world of the resent--not a policy based upon conditions that existed generations ago.

Records of the U.S. Coast Guard and Geodetic Survey for the past 20 years show that ocean levels

Rabies Cases Increased In 1946

Based on data assembled from State authorities, the Bureau of Animal Industry of the U. S. Department of Agriculture has announced that reported cases of rabies for the calendar year of 1946 totaled 10,872. This was the largest number to be reported in any calendar year in a decade. The 1946 report lists 22 cases in humans, 8,384 cases in dogs, 962 in cattle, 44 in horses, 15 in sheep, 22 in swine, 455 in cats, 12 in goats and 956 miscellaneous cases, including mules, foxes, coyotes, skunks and chickens, with 789 cases reported for foxes alone.

Effects Of Mechanization May Be Both Good And Bad

Sherman E. Johnson of the Bureau of Agricultural Economics, writing in the new Yearbook of Agriculture--Science in Farming--which is ready for distribution, says the effects of technology on farm people may be both good and bad.

Continuing, Johnson says: "Those who can take advantage of the new techniques are likely to increase their net incomes a great deal.

"On the other hand, those who cannot adapt their operations to the new conditions may find themselves at a relative disadvantage. And workers who are displaced may suffer hardships unless other employment is readily available.

"Those growing pains of technological progress can be softened. Special educational and other programs can be provided for those who are disadvantaged by technological changes. Progress in farm technology can result in net social gain, but this is a potentiality and not an inevitable consequence.

"Farm people will need to learn how to live with the new techniques, and to use them to their advantage. To attempt to stop, or even to slow down, the tide of progress would be too costly to farmers over a period of years.

"If farming, as well as other sectors of our economy, is rapidly adjusted to produce more with less effort. More time will be available for other things, including education, recreation, and increased leisure. And the real incomes per farm and per family will be larger."

Copies of the yearbook can be obtained at a cost of $2.00 from the Superintendent of Documents, Government Printing Office, Washington 25, D. C. Being a Congressional document, each member of Congress has an allotment of the new yearbook for free distribution. The Department of Agriculture has no copies for general distribution and none for sale. Prospective purchasers of the yearbook should send the money only to the Superintendents of Documents, not to the Department of Agriculture.

Negro Sharecropper Climbs Into Ownership By Balanced Farming And Budgeting

By budgeting his acres in a diversified farming program, and by budgeting his hard earned dollars once he got his hands on them, O. I. Scott of North Carolina has pyramided a dollar and half into a good bank account and two 100 acre farms, reports the North Carolina State Extension Service.

Seventeen years ago, Farmer Scott, his wife and four children unloaded a skimpy wagon load of furniture at a farm shack near Ral[illegible]. Besides the furniture, the Scotts had only a dollar and a half between them and a strong determination to get ahead.

By carrying out a balanced farming program—tobacco, corn, vegetables, hogs, cows, and chickens—with good management and hard wo[illegible] the Scotts have climbed step by step into ownership. Today they own a well-furnished home, 2 100-acre farms and adequate livestock and poultry. They operate one farm and rent the other to tenants. Everything they have is paid for and they have money in the bank.

"World Situation" To Be Theme At 44th ATA Meet In Tallahassee

MONTGOMERY, ALABAMA, July 3—THE AMERICAN TEACHERS AND THE WORLD SITUATION will be the convention theme for the 4th annual convertion of the American Teachers Association to be held at the Florida A. & M. College at Tallahassee beginning Sunday night, July 20, and extending through Tuesday night, July 22.

Continuing its emphasis upon the relationships of the teachers of Negro children to pressing national and international issues, the ATA focuses attention upon some of the implications for teachers of the current world situation. The keynote address will be delivered at the opening session on Sunday night by Dr. Doak S. Campbell, President of the Southern Association of Colleges and Secondary Schools and President of Florida State University at Tallahassee. Dr. George S. Counts, Teachers College-Columbia University, eminent authority in international education will be the featured speaker for the Monday night session. Governor William S. Hastie of the Virgin Islands is expected for the climaxing address at the closing session on Tuesday night. Recognition will also be taken of the centennial celebration of the founding of Liberia.

The two morning seasons will include a memorial hour in tribute to the deceased members of the year, a series of reports on the several aras of professional representation of the organization during the year, and the fourteen departmental discussion groups. Each of the two afternoon sessions will be allocated to the business deliberations of the Delegate Assembly in which the various states have reprsentation in proportion to the number of ATA members from the respective state.

The American Teachers Association will report wide distribution of its 2nd publication "One World in School" as well as the continuing demand for the first publication, "The Black and White of ejections for Military Service." Initial progress will be made on a third study now underway.

Walter N. Ridley, Chairman of the Department of Sociology at Virginia State College, will conclude his three-year term as ATA President. Dr. H. Council Trenholm, President of Alabama State Teachers College is the ATA Executive Secretary.

He Could Not Hear His Own Music

ARCHER WALLACE

It was a pathetic circumstance which caused Ludwig van Beethoven, one of the greatest musicians of all time, to be unable for the greater part of his life to hear his own music. He was born at Bonn, Prussia, in 1770. His childhood was not by any means a happy one. His father, who was a musician, earned only a very small salary with which to support his family of seven children, and besides he was a man whose drunken habits reduced the family income still further.

Ludwig was only four when he began to study music, and by the time he was nine he had mastered all that his father could teach him. At the age of seven he gave a series of concerts in Cologne. Very soon he began to compose music. When only ten he went on a tour to Holland with his mother, and a year later he was appointed deputy organist of the Elector's Chapel. While he was still very young he went to play before the great Mozart. Mozart was very busy and did not want to be bothered. He took very little notice of young Beethoven, which disappointed the lad; but the boy sat down at the piano and began to play in such a manner that the great musician said to his friends. "This youth will someday make a noise in the world."

Then it was that a very serious thing happened to Beethoven—he began to lose his hearing. For awhile he would not admit it, even to himself. That he, who was so fond of music, to whom it seemed the sweetest thing in life, should cease to hear, seemed too cruel to be true. It was almost the same as if some great artist were suddenly to lose his eyesight and never again see the beauty of colors. He consulted one doctor after another in frantic efforts to find a remedy. It was of no avail. His deafness increased so quickly that while he was still a comparatively young man he was nearly totally deaf.

He got his greatest inspiration out of doors. He would go out in the wettest of weather, then come in dripping with rain, and shake the water from his hat and clothes, quite unaware that he was spoiling the carpets, coverings, and furniture. It seemed as if he must get alone with nature, and with God in order to do his best work. His mind was strangely awakened by the sight of a storm. He seemed supremely happy when the wind bent the pine trees around him and the lightning flashed. He could not hear the singing of the birds, but he loved to watch their flight and remember how they sang. He would stay in the solitary woods until his whole being seemed full of strange music; then he would hurry back to his room to put down what he had conceived while the inspiration was still upon him. As he raced through the streets with his hat gone and his bushy head down, not looking at anyone, the people who knew his strange moods would laugh and say, "It is just Ludwig van Beethoven. Only his body is in this world."

There is no doubt that at times Beethoven was subject to fits of irritability and even to fits of rage. But it must not be forgotten that he was a great sufferer. In addition to being deaf, he suffered much from rheumatism, indigestion, and finally from dropsy.

For a considerable time after he became deaf Beethoven continued to lead the orchestra in his great compositions. He was extremely sensitive, and no doubt he often pretended to hear when in reality he could not. He was just as eccentric in leading an orchestra as he was in private. He would put tremendous physical energy into the task, making himself smaller and smaller to compel softened sounds, then rising and standing on tiptoe with head thrown back when every instrument of the orchestra burst forth.

All during those anxious years when sickness and poverty dogged his footsteps, Beethoven continued to compose such music as ranked him among the greatest composers that ever lived. He was very anxious about his CHORAL SYMPHONY, and urged on by friends he consented to conduct the first performance. His friends could not have realized the full extent of his deafness or they would never have allowed him to be placed in such an unfortunate position. He stood up before the orchestra and energetically waved his baton, but evidently he could not hear the music. At the conclusion of the piece, the audience thundered its applause, which Beethoven could not hear, but someone turned him around to face the people, who were wild with enthusiasm, and then it dawned upon the great musician that they were showing tremendous appreciation, and he was deeply moved.

Beethoven died in Vienna on March 26, 1827, in his fifty-seventh year. He had undertaken a long journey in winter, and the severe cold and exposure brought on inflammation of the lungs and dropsy. He died during a terrible thunderstorm and prompted, no doubt by the heavy burden he had borne so long, he said with his last breath, "I shall hear in heaven."

USDA Chemists Find New Test For Maturity Of Cotton Fibers

Chemists at the Department of Agriculture's Southern Regional Research Laboratory in New Orleans have developed a differential dyeing procedure which demonstrates the maturity of cotton fibers.

The new method is based on the facts that mature cotton fibers are thick-walled and immature ones thin-walled, and that thick and thin-walled fibers take the same dyes differently and also take different dyes. The test is easily made on unprocessed cotton lint in laboratory or dyehouse. When fully perfected, it should have wide usefulness, say Department scientists.

AFL Leaders Cites Gains for Labor to La. Baptists

New Orleans—"Economic insecurity, the failure to have a job or to be secure in it is one of the most demoralizing facts a man can comphrehend," said Dr. George Snowden, liaison officer of the American Federation of Labor, addressing the 38th Annual Convention of the Louisiana Baptists, in Lake Charles, Louisiana, last week.

Organized labor has changed America from a nation where the wealth was concentrated in the hands of a few to a land where the worker can reap the benefit of his handiwork, Snowden continued. He asserted organized labor has just begun its work to secure the blessings of our great country for its people and when it is successful, poverty will be unknown.

Earl Conrad's New Book

There has just been issued a publication, "The First Portrayal Of Jim Crow As A System," written by Mr. Earle Conrad. The book itself is under the caption of "Jim-Crow In America." They are now claiming that it is hailed by experts as one of the few publications that really attacks the problem and deals with it in its true form.

A copy of the publication reached Houston, Texas sometime ago, and is being sold by one of the local book stores in the Bayou City.

Personnel Of University Faculty Members

PRESIDENT R. P. DANIEL AMONG THE NEW STAFF FOR 1947-49 IN NORTH CAROLINA INSTITUTION

Raleigh, N. C., July 14—A partial ist of additions to the faculty of Shaw University for the 1947-48 school term was made public recently by President R. P. Daniel. Among new staff members are:

Carl E. DeVane, A. B., Shaw University, M. A. Atlanta University, completed course requirements for the Ph.D at University of Pennsylvania, Instructor in History.

William N. Smith, A. B., Alabama State Teachers College; M. A. Atlanta University; completed course requirements for the doctorate at Columbia University. Instructor in Psychology and Personnel and Veterans Counsellor.

Mrs. Vivienne Hood Smith, A. B., Wiley College, M. A., Atlanta University; work toward doctorate at Columbia University, Instructor in English.

Miss Enola E. Laws, B. S., American International College, Springfield, Mass.; Diploma in Voice. Institute of Musical Art of the Julliard School of Music, Instructor in Music.

The Rev. Charles R. McCreary, B. S., Virginia Union University; B. D., Andover-Newton Theological School; work at Union Theological Seminary, Richmond, Va., and Union Theological Seminary, New York, Instructor in Bible.

Miss Willie Blanche Baker. A. B., Shaw University, B. L. S., Atlanta University Library School, Assistant Librarian.

Caswell Carter, B. S., Shaw University, Men's Proctor and Director of Men's Activities. Mrs. Sarah Lambe, B. S., Shaw Univereity, Assistant Dietician.

Professor: Hey, you can't sleeep in my class.

Freshman: I know. I've been trying for the last half hour.

Leading Newsman In Washington Raps Bias Of NAACP Officials

Washington, D. C.—Louis Lautier, leading colored newspaper reporter at the Nation's Capital, is unsparing in his criticism of the NAACP officials for the partisanship they showed in selecting the speakers for the 38th annual session of the organization, and stated that the sessions with the exception of the Sunday afternoon mass meeting, addressed by President Truman, were very ordinary. Mr. Lautier points out in his article to all papers belonging to the powerful Nat'l Negro Publishers Association, that while there are any number of persons in Washington capable of enlightening a convention on great issues, the program managers saw to it that only one point of view was presented, this being that representative of the views of the Truman administration.

Lautier says that no sooner had Dr. Louis T. Wright delivered, on the first night, the annual report of the board of directors, in which it was claimed that the association followed a traditional policy of non-partisanship in politics, they paraded out speakers who talked partisan politics. These were Leon Henderson, chairman of the executive board of the Committee for Democratic Action. Next night came Congresswoman Helen Gahagan Douglas, a Democrat, whom Mr. Lautier criticised for her over-simplification of the problem of getting an FEPC bill passed. Mrs. Douglas tried to make it appear that with a Republican House and Senate it was easy to enact the FEPC bill, ignoring the filibustering members of her party, who are in congress in as big a quantity as when the Democrats controlled Congress.

Then, Mr. Lautier points out, followed Philip Murray of the CIO who damned the Taft-Hartly labor bill. No chance was given by the "non-partisan" NAACP to any friend of the labor bill to express his views.

The success of NAACP branches in influencing congress by writing letters was jeopardized by the partisanship of the NAACP officers in selecting speakers, Mr. Lautier states.

And like so many other commentators he sees as the biggest hindrance to NAACP progress the fact that, as he says, a small group, running the NAACP, "believe themselves omniscient and they restrict participation by the membership to a minimum. They pick the speakers to address the annual conference. They make the decisions as to whether a pending bill shall be supported or opposed without any consultation of the membership."

In this connection it is recalled that Walter White and his associates opposed the appointment of a war investigation committee by the 80th Congress apparently because it would be headed by a Republican senator. This was exactly the position taken by President Truman and the Democratic administration. Why the NAACP would oppose the uncovering of frauds in the conduct of the war cannot be explained except by the term "partisan politics"—a desire to keep the NAACP enslaved to the Democrats, despite the fact a Republican Congress is now in power and the NAACP ought to be "standing in" with it.

Hints On Growing Roses May Add To Your Pleasure

By Dr. Floyd Bralliar
Garden Editor, The Nashville Tennessean

Give your roses close attention through the summer if you wish to get full enjoyment from them.

Here are some of the things to do in growing roses that are the pride of the garden:

Cultivate through the summer until the end of September not only to destroy weeds but to areate the soil. The soil should never be allowed to bake.

One way to keep a crust from forming is to apply a good mulch. This also helps conserve moisture. After a heavy rain, it is advisable to hoe and rake rose beds just as soon as the soil has dried sufficiently, unless they are well mulched.

If you water, be thorough about it. Sprinkling is actually bad for plants since it brings the feeding roots to the surface and often causes burning. Water in the forenoon preferably, as the foilage will be dry by nightfall. This lessens the danger of mildew, a disease which thrives in cool nights and wet foilage. During extremely hot periods, it is a good idea to spray plants with a strong stream of water several times a day.

Most roses are grafted on stocks of stronger rooting varieties. Often these send up sprouts from below the graft and these sprouts crowd out the variety you bought. Naturally, these sprouts should be removed as soon as they appear. The only way you can get rid of these sprouts permanently is to remove them at the point where they leave the main root. They should be cut off close to the main stem to keep other buds from developing. They can be readily distinguished by their leaves.

Disbudding

To get beautiful flowers for cutting it is often necessary to disbud, for most varieties of roses, in spite of the efforts of rose breeders, set a cluster of buds at the end of the stem, which makes it necessary to remove all but the end buds to get just one flower on the stem. Some of the best varieties produce only one bud at the end of the stem and therefore do not need disbudding.

Of course Polyanthas roses are supposed to produce clusters of blooms, the larger the better, and of course they should not be disbudded. The real purpose of setting Polyanthas roses is to have either a single plant that will make a definite show, or for bedding purposes. They are very seldom used as cut flowers. When disbudding is done, it should be done as soon as buds are large enough to handle without injuring the bud that is left. The flower on a disbudded shoot will naturally be larger than if no disbudding were done.

It is best to cut roses just as the buds begin to unfold and are yet fairly "tight." Floristic and other professional rose growers usually cut their roses early in the morning and at once stand them in water three or four inches deep to allow the stem to gorge itself with water. Cold water is better than warm for this purpose.

Fertilize Again

All rose bushes should have been fertilized well about the time new growth started in the spring. It is now time to fertilize them again for it is better for any plant to fertilize it often but moderately and repeat it in six weeks and again about the last of August. It does not pay to fertilize any plant too late in the fall for to do so encourages it to produce an abundance of soft and is almost sure to be killed by the first heavy freeze.

We are frequently asked what we consider the best fertilizer to be used on roses. There is no one "best" fertilizer for this purpose, and in our opinion, for the type of soil, and its condition what type of fertilizer to use. In the late fall, after no more danger of new growth until spring, we like to fertilize all but the very richest soil with manure from the horse stable used as a mulch. Cover the surface of the ground with it after the roses have been prepared for the winter, but do not allow the manure to come in direct contact with the rose bushes.

In the early spring, scatter some good complete commercial lightly over the surface of the bed and work this altogether with the manure that has been on the ground all winter into the soil.

This mid-summer fertilizing should consist of a light mulch of fairly old manure from the cow stable, or if this is not available, apply some good complete commercial fertilizer at the rate of one or two pounds per 100 square feet of bed, and work it well into the soil. If the soil is already full of humus, the fertilizer used six weeks later should consist entirely of commercial fertilizer, if the soil is not full of humus, use cow manure again.

Poison Line Saves Oregon Wheat From Cricket Horde

ORDNANCE, Ore.—(AP)—Millions of Mormons crickets headed for death yesterday into a poison line expected to save rich wheat fields only three miles from the main vanguard.

The horde is "under control" along virtually all its 12-mile advancing front. Assistant County Agent Leroy Fuller said after a tour of the area.

Friday the crickets broke through a bait line and spilled over into sagebrush country adjacent to the farmlands of the Umatilla Valley. Baiting crews fell back and spread a new line—aided by a plane pouring out the new chemical chlordane—and this line Fuller said he thought would hold.

The crickets, hopping, jumping, crawling through the poison area, moved on for as much as a quarter af a mile before falling. Thousands upon thousands began to dot the sand and lie under the scattered clumps of sagebrush as more thousands moved up from the rear. But the poison line, Fuller said, is deep enough to take them.

One flank of the attackers swept into a 1,000-acre wheat field 14 miles southeast of here and poison was spread in their path. Pendleton grain growers co-operative said 1,000 pounds of chlordane would be spread on the ranch by pea dusters.

Fuller said baiting would be continued throughout the infested area for 30 days at least. The poison—aided by seagulls which returned to the attack again in the nearby Boardman area—is expected eventually to annihilate the insects which were named for their 1848 attack on Mormon fields in Utah and are properly a wingless grasshopper rather than a cricket.

Fire's Toll Among Children

Speaking over a recent radio broadcast sponsored by the National Board of Fire Underwriters, Mrs. Ruth Bryan Rohde, daughter of the late William Jennings Bryan, told of the terrible toll fire takes among the children of the country.

In 1944, said Mrs. Rohde, 6,000 children under five years of age died in home accidents--and burns acounted for 2,000 of their number. In 1941, 7,500 children seriously crippled from burns were being cared for by state agencies. The number of similar victims in private homes is not known, but must be far greater.

"These children died or were crippled needlessly," added Mrs. Rohde. "These tragedies in most instances were due to adult carelessness or negligence. Let us not wait until tragedy has brought the full force of this to us. Let us begin a campaign of prevention at once."

It is not the children who make the mistakes of omission and commission that are responsible for most fires. It is not the children who are inexcusably indifferent to the danger. It is, instead parents who fail to take the simple precautions that will prevent the great majority of fires--and the communities which lack adequate fire safety laws.

The ghastly toll will continue to grow--until every adult in the country joins in the campain to conquer fire.

Weeds Will Ruin Gardens If Allowed To Get Too Big

By Dr. Floyd Bralliar
Garden Editor, The Nashville Tennessean

Weeds have grown unusually freely this spring. There has been so many rains that the surface of the soil has been too wet for plowing or even for hoeing much of the time.

But weeds will ruin a crop if they are not removed before they get too big. It takes time, but we are pulling the weeds out of the rows by hand and hoe those out that come up between the rows as soon as the soil is dry enough and will not bake when worked.

Fortunately we can pull weeds and grass out of our vegetables rows by hand when the soil is too wet to work in any other way. The reason for this is that in pulling weeds we do not press the soil together but let it lie just as it falls when the weed roots come out. Should it rain again soon the soil will settle back as it was. Should it not rain before the soil is dry enough to hoe we can fill any uneven places when we hoe between the rows. But weeds should not be allowed to grow in the row if we can prevent it.

If you did not get to plant all the garden you desired to plant at the proper time, better plant just as soon as you can. Even though you may be able to plant a very few minutes every day get your planting done at once.

A few days ago we planted our kale between showers. It was up to a good stand the third day. Like many others we planted our lima beans just before one of our cold rainy "spells" and very few of them came up. The day we planted our kale we replanted these lima beans with the same kind of seed and in five days they were up well. We mention these things to call attention to the fact that it seldom pays to get in too big a hurry to plant seeds that are tender to cold. Probably had these beans come up when they were first planted they would not have set beans more than a day or two earlier than these planted almost a month later.

Do you think that because the ground has been wet much of the spring it will continue to be so all summer. The good and successful gardener will not be caught without a dust mulch on his garden when the dry weather we are sure to have arrives.

The New Naval Reserve

The New Naval Reserve provides an opportunity to eligible men to perform a distinct and essential service to their country--and to become proficient in skills which are of value to them in civilian pursuits.

The record of the Naval Reserve is known to everyone. It has performed magnificently in time of crisis. Its basic purpose is the defense of the United States.

Reserve instruction involves spare time courses not only in the military sciences, but in a long list of technical subjects and trades. Recreational activities are regularly scheduled by Reserve units. And Reserve groups on the coasts of the nation and the Great Lakes are assigned to Navy ships for short training cruises in local waters.

Membership in the New Naval Reserve is open to citizens between the ages of 17 and 39. War veterans will be given the grades they held when on active service. The Reserve offers its members a splendid chance to serve both the nation and themselves.

Rural Women's Club Marks 10th Anniversary

A home demonstration club of Logan County, Okla., celebrated its 10th anniversary recently with a review of its achievements, reports Mrs. Rosa J. Parker House of the Oklahoma State Extension Service.

During the 10-year period, the club has purchased two pressure cookers and two sewing machines for 4-H club girls' use. Also the club has provided $200 in prizes to encourage home improvement and 4-H work.

$3,000,000,000 A Year For Oil

The oil industry must spend the enormous sum of $3,000,000,000 a year for some years to come on new facilities and improvements, according to Dr. Robert E. Wilson, chairman of the board of the Standard Oil Company of Indiana.

That is nearly three times the average yearly expenditure during the past decade. It will be used, Dr. Wilson said, for six primary purposes: to find and develop additional sources of crude; to build new pipe lines, refinery units and other equipment; to employ new methods of conserving oil and gas; to make gasoline from natural gas and develop new products; to improve existing facilities; and, finally, to develop foreign sources of oil for the United States.

This need is, of course, the result of an unprecedented and to some extent unanticipated increase in the demand for oil. It was naturally expected that after the war there would be a certain drop in consumption of petroleum in its various forms. That did not occur--instead, our peacetime appetite for oil has been even greater than we demonstrated in war. Thus, the industry is undertaking a development program of unprecedented scope.

In pursuing this program, the industry is facing many an economic problem. A service station costs about three times what a comparable installation cost ten years ago. The cost of wildcat wells on the basis of oil discovered has multiplied sixfold. Costs are similarly swollen in every phase of the oil industry's activities. In the light of that, it is a remarkable tribute to the industry's efficiency that oil prices have risen as little as they have.

The industry's job, in short, is to meet our oil needs at the lowest cost possible. And that is precisely what it is doing.

Conservative Farm Loan Policy Urged On Lenders

WASHINGTON—(AP)—A national farm real estate conference urged that banks and other money lenders adopt a conservative policy toward loans backed by farm mortgages.

The conference was held at the request of President Truman who has said a continuing boom in farm land prices could wreck agriculture. It offered no other specific recommendation beyond a voluntary program of cautioning both lenders and borrowers as to the dangers of the situation.

Attended by representatives of government and private lending institutions, farm organization leaders, and agriculture department officials, the meeting heard arguments that the government itself through its own "liberal" policies is contributing to high land prices.

C. W. Bailey, president of the American Bankers Association, told the conference that "factors other than credit have caused the rise in farm land prices.

Bailey, president of the First National Bank of Clarksville, Tenn., said an ABA survey, including a poll of state banking commissioners, showed little indication of inflationary loans by banking institutions and showed only a minor increase in the volume of farm mortgage loans held by state and national banks.

The main factors, he said, are higher farm incomes arising from increased demand, higher production and incentive payments from the federal government, along with steadily lower interest rates.

Meanwhile, on the floor of the house, Rep. Harold D. Cooley (D-N. C.) assailed the conference as "a deliberate effort to drive down the value of farm land and to frighten the public."

Opening the conference, which was held behind closed doors, Secretary of Agriculture Anderson urged all lenders to adopt what he said was the government's policy of making loans based only on the normal, or long-term, earning capacity of farms.

July Corn Prices Reach 99-Year High, Retreat

CHICAGO — (UP) — July corn futures soared to $2.00¾ a bushel on the Chicago board of trade yesterday. It was the highest price ever paid in the 99-year history of the exchange.

Influenced by export demand and the threat of severe crop reduction because of Midwestern rains and floods, contracts sold for delivery in July epened just ⅝ of a cent below the previous all-time high of $1.99⅛ paid in July, 1919.

The prospects of curtailed supplies and the export demand for Europeans nations sent the July contracts up to $2. A few trades later they moved up to $2.00¾.

Bidding Increasing

The bidding contests in corn futures have been increasing for nearly a month. In addition to the overseas drain of supplies, persistent rains flooding the Cornbelt states have brought a serious crop threat.

The bureau of agricultural economics at Washington, reported yesterday on the 1947 pig crop, said that the uncertain outlook for corn had influenced many farmers to curtail use of corn in fattening pigs.

Market observers and traders declined comment on the effect a continued high price range for corn might have on retail levels.

Rain-soaked fields have delayed planting in some cornbelt areas. A recent national survey indicated that about 80 per cent of the new fields through the nation had been sown. An Illinois survey showed that only one-half of the normal acreage had been planted and that corn stalks generally had grown only about four inches.

Spokesmen for thee Uhlmann Grain House of Chicago, were optimistic. They said their information was that only a comparatively small percentage of corn area had been flooded, "though some reseeding must be done." They said the future price would depend on the weather from now on.

Prices To Continue High

H. M. Conway, director of research for the National Livestock Producers' Association, said meat prices were going up and "will continue to do so due to the shortage of corn and its consequent rise in price."

"The brightest spot for the consumer is pasture cattle—beef from the ranges and pastures," he said. "As this cattle is not affected by the present corn shortage, it will end to stay the same price and some grades will even go down in price. High quality beef will be the major scarcity."

He predicted that pork would be in low supply, due to delay in the corn harvest.

USDA Scientists Breed New Varieties Of Flowers

How tomorrow's flowers are recently developed to meet special needs was demonstrated to radio farm directors recently in a preview of new varieties of snapdragons, carnations, and garden lilies created at the U. S. Department of Agriculture's Plant Industry Station, Beltsville, Md.

The flower breeder usually has more than one objective in mind when he makes selections for crossing and breeding new varieties, says Dr. S. L. Emsweller, scientist in charge of the floricultural investigations. His aim may be a variety with more and larger flowers on taller, sturdier plants than any now grown. He may seek new and interesting variations in color, shape and petal formation. He may want to extend the flowering season with early and late blooming varieties, or disease resistance may be the major goal, says Dr. Emsweller.

A fairly recent genetic discovery that plants treated with colchicine, a poisonius drug, undergo marked changes in structure, was used to create 11 magnificent snapdragon varieties.

Professor: "This essay on 'Our Dog' is, word for word, the same as your brother's."

Student: "Yes, sir. It's the same dog."

WOMAN'S PAGE

Helpful Household Hints

HONEY TWIST COFFEE CAKE

1 cup milk
¼ cup butter or fat
½ cup sugar
1 teaspoon salt
2 cakes yeast
2 eggs well beaten
5 cups sifted flour (about)
Two-thirds cup confectioners' sugar
1 egg white
2 tablespoon honey
½ cup chopped nuts

Scald milk. Add butter, sugar and salt. Cool to lukewarm. Crumble and add yeast. Add eggs, well beaten. Beat in to make a soft dough. Knead until smooth. Form into a ball, place in a greased bowl, cover and let rise until double in bulk. Form into a long roll about one inch in diameter. Coil the roll into a greased 9-inch cake pan, beginning at the outside edge and covering the bottom. Cream butter, confectioners' sugar. egg white and honey. Spread over twist in pan. Sprinkle with chopped nuts. Bake in 375-degree oven 25 to 30 minutes. Serves six.

QUICK COFFEE CAKE

2½ cups flour
4 teaspoon baking powder
½ teaspoon salt
One-third cup sugar
Two-third cup, raisins
1 egg
One-third cup melted fat
1 cup milk

Sift flour. baking powder, salt and sugar together. Add raisins. Combine and add egg, fat and milk to above mixture. Mix well. Turn into buttered pan, nine inches square. Sprinkle liberally with cinnamon and sugar.

WEDDING SALAD

1 lb. white grapes
1 lb. marshmallows
1 large can white pears
Cooked dressing

Split grapes and take out seed. Cut marshmallows in two pieces. Mix lightly with cooked dressing. Fill half pear and serve in cup of lettuce. Pecans make a nice addition. Use whipped cream in dressing. Serves 6 to 8.

Umbrellas folded up when damp are likely to mildew. Leave them open to dry. Then put away in a cool dry place.

In most recipes, macaroni, spaghetti and noodles are interchangeable. Macaroni and noodles are generally preferred in casserole dishes. Spaghetti is generally used with sauces, while elbows and shells are nice for salads: Noodles, stars and alphabets are particularly good in soups.

THRIFTY HAT CLEANER

Straw hats can be cleaned by rubbing with damp corn meal, then brushing off.

Dried peaches offer iron and vitamin A as well as other minerals and vitamins.

To cut down on dish washing when baking, sift flour and sugar on to sheets of waxed or brown paper instead of into bowls.

Heat herbs with a little cooking fat in making sauces or gravies.

MEASURING ROD

A correspondent of the Christian Science Monitor wrote the paper about certain comments that were being so commonly made with regard to the stature of various public characters—Churchill, Stalin, Chiang Kai-shek and Dewey.

The correspondent said, "It might be well for critics to recall the quotation from Isaac Watts poem "True Greatness," which reads:

'Were I so tall to reach the pole,
Or grasp the ocean with my span,
I must be measured by my soul,
The mind's the standard of the man."

WHITE POUND CAKE

1 lb. creamed butter
1½ lbs. sifted powdered sugar
18 egg whites beaten stiff
1¼ lbs. sifted flour
2 teaspoon baking powder
¼ lb. cornstarch

Beat whites very stiff; then by degrees, stir sugar into them. Cream butter and flour together, putting in a little flour at a time, until it will absorb as much as it will take without forcing: then add the whites and rest of flour alternately. The flour should be sifted several times with cornstarch and baking powder. Bake in loaf or layers in 325-degree oven one hour to one and one-fourth hours.

BOWKNOT ROLLS

Combine: 1 cup milk, scalded, ¼ cup melted shortening, ¼ cup sugar, and 1 teaspoon salt. Cool until lukewarm. Soften 2 cakes fresh yeast in ¼ cup lukewarm water. Add yeast to milk and stir in 1 well-beaten egg. Stir in 3½ cups bread flour. Beat vigorously until dough is quite elastic. Turn out on floured board. Knead until smooth. Place dough in greased bowl. brush with oil, cover and store in refrigerator.

About one and a half hours before baking time, roll dough about one inch thick. Cut into strips. Roll into ropes about ½ inch thick and 6 to 8 inches long. Tie loosely into a knot. Place on greased cooky sheet. Brush with oil. Let rise until double in bulk. Bake at 450 degrees for 15 or 20 minutes.

STRAWBERRY VELVET

1 envelope unflavored gelatin
¼ cup cold water
½ cup boiling water
2 teaspoons lemon juice
1 cup sliced strawberries
¼ teaspoon salt
¾ cup sugar
2 egg whites
½ cup cream, whipped

Soften gelatin in cold water. Dissolve in boiling water. Add lemon juice and salt. Let cool until mixture begins to thicken. Combine strawberries and ½ cup sugar. Let stand about 5 minutes. stirring several times to draw out juice. Stir into gelatin mixture. Beat egg whites until stiff, fold in remaining ¼ cup sugar. Fold egg whites and whipped cream into gelatin. Pile into sherbet glasses. Chill until firm. Garnish with fresh strawberries and serve. Serve 4 to 6.

CRYSTAL APPLES

6 apples
½ cup sugar
¾ cup water
½ cup syrup,
3 whole oranges sliced
Pinch of salt

Bring sugar, syrup and water with salt to boil. Add apples and oranges sliced. Cook slowly until apples are tender through. Remove fruit from dish. Cook syrup until thick and pour over apples. Serve warm or chilled. Surround with broiled bacon for breakfast dish. Serves six.

HAWAIIAN PORK CHOPS

6 pork chops, cut 1½ inches thick.
2 tablespoons flour
2 tablespoons lard or drippings
Salt and pepper
6 slices pineapple
¼ cup water

Dredge pork chops with flour and brown on both sides in lard or drippings. Season with salt and pepper. **Place a pineapple slice on top of** each chop. Add ¼ cup water, cover tightly and cook very slowly until done, about 45 minutes. Serves 6.

FAVORITE WITH THE MEN

Looking for new salads to appeal to the men in your family—those rugged creatures who disdain fluff? Try one of their favorite vegetables a new way—succulent sauerkraut chilled and tossed with thin green pepper rings, tomato wedges and French dressing, with a light sprinkling of celery seed.

SCALLOPED CELERY

Prepare boiled celery. To two cups celery, add one and one-half cups thin white sauce; place in baking dish in alternate layers: sprinkle top with bread crumbs and bits of butter; run in oven to heat and brown.

Rhubarb is on the market for only a very short time, and its delicate flavor should be savored in pies and sauces. To two pie recipes I am adding a recipe for a rhubarb mousse.

RHUBARB PIE FILLING

2½ cups cooked rhubarb
¼ cup fruit juice
½ cup crystal corn syrup
3 tablespoon quick cooking tapioca
¼ teaspoon salt
2 tablespoon butter

Combine all ingredients except butter and let stand while preparing the pastry. Fill the unbaked pie shell with the mixture, dot with pieces of butter. Cut remaining pastry into strips one-half inch wide and place them over filling, weaving them in and out to make a lattice effect. Attach the ends firmly to the crinkle edge of the crust. Bake in moderately hot oven, 375 degrees. about 45 minutes or until the crust is a light brown. Cool.

Here is a pie which employs sugar instead of corn syrup.

RHUBARB PIE

3 cups rhubarb
1 cup sugar
Juice of ½ orange
2 tablespoon flour

Peel and slice rhubarb to make three cups. Add sugar, orange juice and flour. Allow to stand while rolling pastry. Roll pastry, line pie pan and cut off edge. Add rhubarb and dot with butter. Cover with pastry. Allow top crust to overlap lower crust one-half inch thick. Cut even with shears. Moisten lower edge to seal perfectly and fold top crust under lower. Crimp edges. Bake in 425 degree oven 45 to 50 minutes.

RHUBARB MOUSSE

1 cup rhubarb cooked and mashed
½ cup sugar
1 cup cream whipped
½ teaspoon vanilla
⅛ teaspoon mace

Combine rhubarb and sugar, mix well. Cool. Fold into cream, add vanilla and mace. Pour in refrigerator tray. Freeze two to four hours at coldest temperature.

NOODLE RING

Cook noodles in boiling salted water. Drain, chop, combine two cups of cooked noodles with two beaten eggs, ½ cup milk. Pack into greased ring mold and steam or bake 35 to 40 minutes. Fill center with Ham a la King.

HAM a la KING

4 tablespoon butter
1 cup mushrooms
1 green pepper, chopped
2 tablespoon flour
1 cup broth
2 cups diced ham
2 eggs
1 cup cream
1 pimiento, chopped
2 tablespoon cooking sherry
Salt and pepper

Melt butter in skillet. Add mushrooms, green pepper and flour. Mix thoroughly. Add broth. Cook until thick. Add diced ham. Cook five minutes on low heat. Beat eggs and cream. Add pimiento. Combine ingredients and heat one to two minutes (do not cook). Add sherry, salt and pepper. Serve on toast, popovers, patty shells or in cereal ring.

SEWING TIP

When you machine-stitch rayon jersey, stretch the fabric a little and keep the tension loose so that the seam will be as elastic as the fabric. When you sew rayon jersey by hand, use a very fine needle.

Moisten the table top before putting down waxed paper when rolling dough. This will prevent the paper form slipping.

ASPARAGUS WITH SCRAMBLED EGGS

Place whole stalks of hot, buttered asparagus on a chop plate, radiating from the center to the rim. Fill the center with a fluffy mound of hot scrambled eggs. Sprinkle grated Parmesan cheese over the asparagus and the eggs and serve at once.

AQUACATE SALAD

2 firm ripe avocados
2 hard-cooked eggs, chopped
6 stuffed olives, sliced
3 small tomatoes, diced
¼ cup finely chopped onion
¼ cup French dressing
½ teaspoon chili powder
1 teaspoon salt

Split avocados lengthwise and remove seed, then peel and cut into cubes. Combine avocado, eggs, olives and tomatoes. Mix together onion, Frenh dressing, chili powder and salt. Add to avocado mixture and toss lightly. Serve on crisp salad greens. Makes 6 servings.

FROZEN ROYALE SALAD

2 packages cream cheese
5 tablespoons mayonnaise
5 tablespoons pineapple juice
½ cup Maraschino cherries
¾ cup chopped dates
½ cup mixed nuts

Add mayonnaise to cream cheese and gradually blend in pineapple juice, beating constantly until consisteny of whipped cream. Add **pineapple, drained and diced; then cherries. Carefully blend in dates and nuts. Turn into large mold or individuals molds and place in refrigerator** for 12 hours or longer, or turn into trays and freeze. Serve on bed of lettuce.

SANDWICH FILLING

Put through a food cropper 1 cup of cooked or leftover beef or veal and one-third cup Brazil nuts. Blend with ¼ cup pickle relish, 1 tablespoon prepared mustard and ¼ teaspoon salt. Makes filling for 6 sandwiches.

FOLLOW-UP LAMB DISH

If there is roast lamb left over from dinner, one good way to serve it is to make Curried Lamb. Cut the meat into small cubes and add to brown sauce. Season with one teaspoon curry powder to two cups sauce. Serve very hot on fluffy boiled rice.

CREAMED CARROTS

1½ cups cooked chopped carrots
1 cup white sauce

Add drained carrots to highly seasoned white sauce; heat in double boiler; serve hot. Serves four to five .

Celery, although available the year around and usually served raw, is delicious as a cooked vegetable—particularly the unbleached green variety sometimes grown in home gardens.

PIE PASTRY

2 cups flour, sifted
1 teaspoon, baking powder
¾ cup shortening
½ teaspoon salt

Sift dry ingredients together. Blend in the shortening with two knives or a pastry blender until pieces of fat are about the size of peas. Add ice water, a little at a time. Use only enough water to make the dough stick together. Mix gently into the flour and shortening with a fork. Pat into a ball and chill. Roll out about three-fourths of the pastry and line a nine-inch crinkle-edge heat-resistant pie plate with it. Fit crust loosely into pie plate, making a deep crimped edge. Trim if necessary. Save the remaining pastry to make lattice strips over filling.

BOILED CELERY

Srape celery; cut in small pieces and let stand a few minutes in cold water; drain; cook in boiling salted water until tender; drain and serve with melted butter, salt and pepper.

HELPFUL HOUSEHOLD HINTS

Plastic and leatherette upholstery becomes dirt-resistant and easy to clean when given a coating of liquid wax. Waxing also gives it a high gloss. Save steps with a basket stocked with bottles of cleaners and polishes.

To hasten the preparation of a casserole dish, place the mixture in individual dishes and shorten the cooking period.

Fine, dry bread crumbs that have been browned in meat drippings make a flavorful topping for casserole dishes. Croutons made by frying stale bread cubes in bacon or sausage drippings are an exciting addition to split pea or bean soup.

RESTORE STIFFNESS

If your broom has become a little limp, dip it in a pail of boiling soda water and dry it in the sun.

Chilled sauerkraut served in salads offers pungent flavor contrast to milder salad vegetables.

Always hang slacks or trousers by the legs after washing. The wet weight of the garment takes out most of the wrinkles and the **slacks will need little pressing.**

Woman, Where Art Thou?

By MRS. ANNA BELLE FOSTER
Los Angeles, Calif.

"Where am I and just why was I born?" Frankly, how many times have you asked yourself this question? Surely the Almighty God in His making had a reason for creating you, for it was He who took the rib from man to make woman. Today, with the world in a turmoil and souls hourly going to destruction, these questions are rather appalling to the Christian woman.

The question, "Where are you," has many, many angles for there are many different types of women and all have different paths that lead to different directions, but there is one glorious pathway that leads from earth to heaven. this pathway is the greatest of them all and the women that are travelling this path are and will be God's eternal worshippers. It is the duty of these Christian women to carry the lighted torch of Life that others might see the good works in them. It is also the duty of the woman to become substantial trees planted by the rivers of the Living Water to bring forth her fruit by experiencing normally and naturally, just as a deeply rooted and well nourished tree does. fruit that will be pleasing in the sight of God.

Today we find, more than ever before, a great demand for women of free flowing power of the Divine Life, power that will enable the world to become brighter with more Christian women. But women. you will never find the real **pattern by roaming through the** outside world. though, it may be found by you retreating within, by you trying to find yourself and know yourself, the real eternal you.

"Women where art thou?" Find yourselves and come from among the beer gardens and dance halls, dear women, find yourselves and come out from among strangers, **drunkards, thieves, robbers and** other destructive elements of the world and come to the house of the Almighty God, where the blessings are plentiful upon you and where you may mingle and co-mingle with more of God's people.

Sunday School Teacher—"Now, why was it that Mary and Joseph took Jesus with them to Jerusalem?"

Mary--aged four--"I guess they didn't have a sitter."

THE GODLY EVADE NO ISSUE

Knowing that they are opposed by every agent and agency of Satan, the Godly people seek to prepare themselves for life's every combat. Godly people are prepared by the Heavenly Father to face their foes just as he prepared Gopher Wood for the task of saving seed to continue humanity up on the earth.

Godly folks are prepared to meet life's three main issues, namely: Economic security, Social security, and Divine security. In everything that God has instituted, God intended that man should be economically secure. Before placing him on the earth, God prepared for his comfort and sustainance. For the keeping of his principles and commandments, God promises economic security. It matters not how spirit-filled a man may be, he seeks to make himself secure in the materials of this world. Man is not to be condemned for seeking property as long as he does not intrude upon the rights of another and as long as he strives to make others happy through wise use of his own goods. A man may serve God on an empty stomach, but he seems to be able to render better service when he is getting regular meals. It is to be understood that the writer refers only to sincere Christians. God prepares his children that they may stand firmly upon the grounds of righteousness whether hungry or well-fed; whether ragged or well-dressed; whether he is pauperish or affluent. With the many changes which come in life, one should realize that God only can prepare one to become really economically secure.

Another o fthe great issues of life is social security. A man cannot get the joys out of life when he strives to live alone. It is good to have economic security, but a man who has millions of dollars and no friends is in much worse condition than the poor man who has many friends. Mentally normal people seek to be secure with mankind. We continually seek the friendship and respect of others. Prchaps the most enjoyable thing that a normal man of wisdom has ever heard was something which revealed that other folks though well of him. Despite the fact that Jesus was God and that ne was omniscient, he maintained a certain human element in his dealings with his followers. Although he had a definite didactic purpose in mind there is possibly some sign of human elements in his question, "Whom do men say that I the son of man am?" God through his word and thought himself as the Son, and by the spirit strives to draw men to himself. Despite his power, he seeks to win men rather than to force their love upon himself. God being highly magnetic, will while living in a man draw other men to the person in whom he resides. His spirit draws and holds men better than money, intellect (carnal) or position. No man can be socially secure, even with his own relatives except God be with him.

Divine security is the ultimate

4-H Girl To Tell In Broadcast How She Sewed Way Into College

In a broadcast Saturday, July 12, Miss Emma Holley, a junior at Tuskegee, will tell how she sewed her way into college, according to a report received by the U. S. Department of Agriculture from Dr. J. R. Otis, Alabama State leader of extension work with colored farmers.

Miss Holley will be interviewed by Miss T. A. Whitlow, colored home demonstration agent of Barbour County, and by Announcer Jimmie Willson over Station WAPI of Birmingham at 1:30 p. m., CST. She will explain how she earned enough money to enter college by carrying out 4-H sewing projects.

Dr. Otis says that Miss Holley learned to make corn shuck mats, burlap rugs and crocheted table sets as part of her 4-H work. Anxious to make some extra money to save toward her college education, the club girl displayed her handicraft at the local curb market on Saturdays and took orders for work which she delivered a few weeks later. The first year Miss Holley kept a complete record, she sold $76.50 worth of handicraft. That was in 1943.

By the fall of 1944, she had saved up enough to buy clothes for school and pay all her entrance fees at Tuskegee.

Over Half of Farms In South Are Still Unelectrified

In describing the job yet to be done in rural electrification, Administrator Claude R Wickard of the Rural Electrification Administration pointed out recently that 43 precent or 2,523,469 farms are still without central station electric power.

However, he added that since 1935, the year REA was established, the number of farms with electricity has increased from 11 to 57 percent. He said that electricity has laid the basis for new prosperity, health and happiness in many communities; through electricity many farmers have increased their income and reduced their production costs.

Of the unelectrified farms, over 1,600,000 are in the Southern States.

"This represents over 50 percent of the South's farms, a powerful challenge to future action," said Mr. Wickard.

Old and New Methods of Turpentining

The U. S. Department of Agriculture has delevoped a new method of turpentining which enables white and colored workers in the naval stores industry to doublt their output and increase etheir earnings. At top, a worker employs the old method of wood chipping every week to keeep the gum flowing, while at bottom, a worker uses the new technique of chipping only every three weeks and spraying thee "facee" with a diluted solution of sulphuric acid to keep the gum glowing. The acid increases the rate of the flow of the gum and makes it flow longer. The new method is described in a recent USDA Forest Servicee publication—Farmers' Bulletin No. 1984.

The Old Method

Washington, D. C.—A new method of turpentining—known as chemical stimulation—has been developed by U. S. Department of Agriculture research which enables white and colored naval stores workers to double their output and increase their earnings, say USDA Forest Service officials.

Employment of the new turpentining technique was begun during the war to help increase production and offset the growing manpower shortage. Prior to that time, chemical stimulation had been carried out only on an experimental basis. Department officials point out that since the war, the new method which is coming into wide use has been an important factor in the upping of wages and in the general improvement of housing and working conditions in the naval stores industry.

Since 1943, wages have increased from $12 per week to from $5 to $8

Colored 4-H'ers Carry On Many Interesting Activities

Colored 4-H club boys and girls are carrying on many interesting activities according to reports received by the U. S. Department of Agriculture from State Extension directors.

For example Virginia reports that 4-H'ers in one county have undertaken as their projects, beautification of the school and the development of more playground facilities at the school. In carrying out their projects, the clubbers have set 50 loblolly pines, filled in around the foundation of the school building, moved four tons of dirt, laid off a baseball diamond, erected baskets and layed off basket ball, volley ball, and horse shoe courts. In addition they have purchased and put up swings for the smaller children.

USDA Issues New Guide To Farm Jobs From Gulf To Great Lakes

Migratory farm laborers, coming to help harvest the rich and varied crops of the Lake States, Iowa, Missouri, and the Ohio Valley and southward to the Gulf, can travel this year by a farm labor timetable prepared by the Extension Service U. S. Department of Agriculture, to bring man and seasonal job together with the least expense and loss of time. Central information stations are maintained along main highways in the fourteen cooperating States in the region. County agents' offices in nearly every county exchange local information about crops and jobs. This information is relayed promptly to central offices and the highway stations.

The pocket guides, or timetables, contain maps showing the harvest areas, the principal roads, the information offices and a calendar of drops for each State. The seasonal worker can plan his movements to points of need with reasonable accuracy. Thousands of seasonal workers help with the great complex of crops in the region throughout the long session, but there is no need for widespread haphazard movement of workers.

There is no generally distinct pattern of migration of farm workers in this region. Sources of seasonal labor are found in every state and distances between jobs in gathering the maturing crops are usually less here than in the West. Spanish-speaking workers from Texas, however, often migrate in large numbers to the sugar-beet producing areas. Southern Negroes do not go north in large numbers, though some thousands move from job to job in the cotton states.

Men from the Appalachian and Ozark districts, accompanied in many cases by their families, roll northward by car, bus, or train to help with the crops. Great dependence also is placed by the growers of truck and fruit crops on workers from nearby cities. Detroit, Cleveland, and Chicago are sources of large contingents; other cities furnish somewhat

This comfortable, convenient farm home helped this family to be recognized as one of the leading families of their community.

A Symbol of Progress for Negro Farmers Exemplified by Gordon Family

By Ocie Lee Smith

Earle, Arkansas and vicinity was the scene of a gala affair April 29, 1947, at which time the Clint Gordon Family, winner of the Farm Family of the Year contest, was featured.

This family won out over four other families in a runner-up contest sponsored by the Farmers Home Administration. The winning family record must reflect the greatest amount of progress made within twelve months. Thus the selection is determined by exemplification of managerial ability. Farm and home improvement, soil conservation a steady increase in net income and retirement of in debtedness on the farm. This familys net income increased from $138.00 in 1940 to $4,974.00 at present.

Farmers, agricultural and community leaders, teachers and ministers gathered on the Clint Gordon farm about two miles from Earle, Arkansas at 10:00 A. M. After inspection of the farm and home, Mr. S. A. Haley, Head of Agriculture Department, A. M. & N. College, assisted by five senior farm Agriculture Department, and one lady from Home Economics Department conducted a front porch forum and quiz, using as their theme, — The Outlook for the

Farm eexpert joins Mr. and Mrs. Gordon in their inspection of their grain crop.

Negro Farmer in Southern Agriculture.— This developed into a provocative discussion which was enjoyed by all. About 12:30 P. M. we climbed into wagons, trucks and cars and journeyed to the Dunbar High School in Earle. The citizens of Earle prepared and served a sumptuous meal for all present.

At 2:00 P. M., the auditorium of the school was filled to overflowing. The highlights of the program were: Music by the Fargo School Chorus conducted by Miss Wade. An accomplished musician; inspirational address by Dr. John H. Williams, Administrative Assistant, Farmers Home Administration, Dallas, Texas. Using the theme as a basis for the thesis, Mr. Williams held the audience spellbound. Drawing upon his training and rich experiences, with his fundamental concepts of a glorified age, he imparted information and inspiration that should rebound to an abundant life for farm people.

The family was the recipient of numerous awards given by the white citizens of Earle, Arkansas congratulating them upon their efforts to become an example in their community, county and state for other farmers. Mr. R T. Huxtable and son sponsored this activity.

Mr. and Mrs. Gordon inspect their crop.

New Guide to Farm Jobs Issued by Agriculture

White and colored migratory farm workers seeking employment will have the aid of a pocket-sized timetable to help direct them to seasonable jobs this year.

The guide was prepared by Extension Service of the U. S. Department of Agriculture and copies are available at the offices of county agents and at U. S. Employment Service offices.

The guide contains maps showing the harvest area, the principal roads the information offices, and a calendar of crops for each State. Extension of iicals point out that this guide will help workers save time and effort in seeking farm employment. They say that there is no need now for widespread haphazard movement of workers.

Do Not Use DDT as Spray on Vegetables to Be Eaten

By Dr. Floyd Braller
Garden Editor
The Nashville Tennessean

The question concerning use of DDT in the garden is becoming a serious one.

There have been so many new insecticides, fungicides, and weed killers put on the market recently, to say nothing of the various plant hormones that have appeared within the last two or three years, that the public has been confused.

Recently we have been informed that the mis-information is being spread that if tomatoes are sprayed with a solution of DDT they will produce first-class fruit without any seeds.

DDT is a poison and is not only poisonous if taken into the stomach, but a few whiffs of the spray often produce illness; in fact many of the instructions issued in recent months for the use of DDT as a spray recommend that they use with a handkerchief or some similar cloth tied over the nose to prevent breathing this material.

May be Absorbed

Furthermore, one who works with this material must be careful about getting it on the skin, for it is sometimes absorbed into the tissues in an amount that will cause sickness. DDT is not easily washed away by rain and for this reason we urged our readers not to use it as a spray on any food that is to be eaten. It is a wonderful insect killer, in fact there have been fewer flies this year than we have ever known before, doubtless due in part, at least, to the fact that most up-to-date dairymen and stablemen sprayed their barns and milking sheds thoroughly with this material and renewed the spraying frequently enough to kill all flies that landed on the surface of the wall that had been sprayed.

However, all instructions for the use of DDT warn against spraying animals with this material if the animal has the habit of licking itself or licking each other.

Warns Against Spraying

We wish to warn against spraying bean plants after they have set on beans, tomato plants and pepper plants after they have started blooming, cabbage, lettuce, in fact, any and all garden vegetables that are of such a character that the user might eat some of this material.

It is possible to spray or dust tomatoes with fruitone, one of the hormones that appeared on the market about three years ago. This hormone is often used for spraying beans, tomatoes, and other crops that have a tendency to drop their leaves without shedding their fruit It is nonpoisonous and so is perfectly safe to use. It can be had from any of our local seed stores but do not confuse it with DDT

On the Agricultural Front

PATSY GRAVES APPOINTED HOME ECONOMIST IN FHA

Washington, D. C.

Appointment of Miss Patsy A. Graves as a home economist in the Farmers Home Administration of the U. S. Department of Agriculture was announced this week by Administrator Dillard B. Lasseter.

Miss Graves, who is trained in home economics and social work, will help develop and coordinate the prigram of home management supervision, Her work will relate to production and conservation of the home food supply of colored FHA borrowers, and to their problems of budgeting, clothing, and general home management.

Prior to her appointent in FHA Miss Graves was neighborhood secretary for the New York City Urban League. Also, for several years she was associated with Extension Service, first as a county home demonstration agent in Alabama and later as a member of the State Extension staff in West Virginia.

Miss Graves is the first colored home economist to be placed in the national office of FHA to help supervision at State and county levels. Her program will touch the homes of the 60,000 colored FHA borrowers, helping the homemakers to realize the greatest possible benefits through FHA assistance.

At present there are 26 colored county home management supervisors serving colored borrower families. They help these families with their gardens, poultry, food preservation, budget planning, and home improvement. Miss Graves will work very closely with these supervisors, assisting them in making their program more effective.

Miss Graves, who is a native of Alabama, received her training in home economics at West Virginia State college, and her social work training at the New York School of Social Work from which she holds a M.S. degree. FHA officials point out that her combination training will serve her in good stead in dealing with rural community problems, both economc and social.

POOR FISH

Talkative lady: "A big man like you could find a better occupation than catching poor little fish."

Wise fisherman: Maybe so, ma'am. But if this poor little fish had kept his mouth shut, he wouldn't be on this hook."

—McCall Spirit.

Be Careful With Poison

Now that spring is really here many housewives will begin to prowl around in dusty attics or littered basements. They will dream up ways for getting the "little man" to roll up his sleeves and buckle down to the necessary evil—spring house cleaning.

Important in the cleaning program will be the job of getting rid of insects and rats. This means that housewives will be using roach and rat poisons in a variety of forms—lye, sodium hydroxide, strychnine, sodium flouride, etc. In the eagerness to get rid of pests, carelessness may cause the death of pets or even children.

Very few cases of home poisoning ever reach the headlines, but doctors and veterinarians could show many records of suffering and death brought about through careless use of poisons. Sometimes the person who dusts shelves with ant or roach powders forgets it, to say nothing of others who know nothing about it.

When pets or children come in contact with the poison dust without knowing it, they get enough to cause acute pains, vomiting, or death. The parents don't know what has happened. By the time the doctor arrives and discovers the cause, it may be too late. Dogs may dig up poisoned food from the ground or overturn garbage cans in which poisoned food has been thrown. The best advice in such cases it: "BE CAREFUL WITH YOUR POISON!"

Do not use knives or rough scouring materials to clean glass cooking ware. This scraping may scratch the protective surface of the glass and finally lead to a crack.

Apple Boxes Made Useful

Perry County 4-H Club girls and home demonstration women did much to make homes and schools more healthful and sanitary during National Negro Health Week, March 30—April 6.

They made medicine cabinets, bed trays, and soap boxes from discarded apple boxes. Each piece of the box was sand-papered twice in order to make it smooth. Then it was cut to size. Heavy pieces of wood were used for the tops and bottoms of the medicine cabinets, and thin wood for the backs, sides, shelves and doors.

Wood glue was used to join the surfaces together. Nails from the old boxes also were used. The cabinets were painted white and light green. It cost about 25 cents to make one cabinet, 16 cent for a bed tray, and 5 cents for a soap box.

Poultry Profits Used to Buy Refrigerator

Mrs. Ozie Harriel, St. John Community in Hale County, bought 150 baby chicks and raised 147 of them. She sold the chicks eight weeks after she got them for $94. The money was used to help buy a refrigerator.

Mrs. Harriel said, "I've been saving money from my poultry sales to buy a refrigerator ever since we got electricity in our community. I have it now and it saves time as well as food."

She has been cooperating with the extension service program for several years. She has served as a club leader and at the same time she was a successful homemaker. She says that her success with poultry is due to having followed recommended practices in care and management of her flock.

As a result of Mrs. Harriel's progress, four other families in the community have been encouraged to grow baby chicks to add to their cash income.

Ministerial Alliance to Aid County Agent

A newly formed ministerial alliance of 39 ministers in Prince George's County, Md., has pledged to assist the colored county agent in passing along farm, gardening, health, and home improvement information to the rural families in the county, reports Martin G. Bailey, district Extension agent of Maryland.

Officers of the new alliance are: The Reverend J. T. Brooks, president, T. J. Houston, vice president, Joseph C. Weems, secretary and J. W. Ford, treasurer. The organization was formed in the office of County Agent J. R. Taylor in the Upper Marlboro courthouse.

The secret of success in cooking eggs is low or moderate, even heat, according to the U. S. Department of Apriculture. Eyvs cooked at low heat are tender when done. At high heat they become tough and leathery. When cooking eggs in water, have the water simmering but not boiling. When frying eggs, keep the heat even by using a thick skillet and turning the heat low

Farmers, agricultural and community leaders gathered at the Clint Gordon Farm.

Luxury Or Necessity

Representatives of nations where there is no freedom of the press and where the people enjoy no privileges of personal liberty have often remarked that the American system of individual freedom is a luxury only a rich nation may afford. This is a flimsy excuse for the brutalities of dictatorship. But would we be so different from these other nations which are tobogganing back into the dark ages, if we were hard pressed by economic chaos? Not if we are to listen to some of our most notable, self-styled liberals who claim with fearful urgency that should another depression descend upon America, she too would abandon the "luxury" of freedom. Some of them would even jump the gun by setting up a planned state now—fixing prices, rigging supply and demand to artifical standards, controlling production, and in effect, establishing government as a spurious God.

When this country was founded, the going was tough. Freedom was the first goal of life. It was not achieved easily. The privilege of going to the church of one's choice was not considered a luxury, nor were ownership of property and the right of assembly and free speech. These things were as vital as air To infer, no matter how indirectly, that they have become luxuries at a time when millions of people over the whole world are looking to the United States to keep alight the torch of civilization, is inexcusable.

Very likely there will be depressions in this county in the future, as in the past. They can either be short pauses in the march forward of a great nation—or any one of them can be the jumping-off point for state socialism and the subjugation of the people. It will depend upon our point of view—whether our freedom is a luxury or a necessity.

Freight Rates

The charge that the railroad rate structure favors the Eastern part of the country to the disadvantage of the West is not borne out by a study of figures taken from official reports of the Interstate Commerce Commission.

Ratemaking for a great country such as this is an enormously complex affair. The rates established must cover thousands of classifications of commodities. Some commodities are transported for only short distances between points of origin and points of consumption-others travel thousands of miles. Under these conditions, it is possible for critics to produce statistics which will prove almost anything.

However, the ICC annually makes public figures showing the revenue, in cents, received for each ton-mile of freight carried in the various sections of the country. This is the average freight rate charged on all traffic, and so provides a true comparison of rate levels as a whole. It shows that, from year to year, the ton-mile revenue in both the East and the West undergoes minor variation. In 1937, for example, the Eastern lines received .971 cents for hauling a ton-mile of freight, while the Western lines received .980. In 1940, this situation was reversed, with the Eastern lines receiving .995 cents as compared with .982 for the West.

In 1946, the Eastern lines received 1.035 cents—and the Western lines received .980. That would seem to thoroughly dispose of the current popular misconception that discrimination exists between these two sections.

The rate situation is eomparable to the boxcar situation. Recently a group of Western Congressmen charged that Eastern lines had drained Western lines of their cars —while the truth was that on the very day the eharge was made, the Western lines had in use more cars than they actually owned! Boxcars are allocated to sections of the country on the basis of greatest need, and when shippers are unable to secure as many cars as they desire, it is the result of a general car shortage which is being made up as rapidly as the railroads can get delivery of new rolling stock. By the same token, freight rates, which must be approved by the ICC, are established on a basis of equality for all kinds of shippers —and for all sections of the nation.

Economic Highlights

Happenings That Affect the Dinner Pails, Dividend Checks and Tax Bills of Every Individual National and Internatiotnal Problems Inseparable from Local Welfare.

As the first Republic Congress in fifteen years draws toward its close, the country is beginning to evaluate its achievements. The sum of public opinion will be of great political importance, inasmuch as the program which the Republicans have started will provide the campaign issues for next year's presidential race.

In the early days of the current Congress, the Republican leadership was widely criticied for what secmed to be an excessive slowness in getting started. That criticism was based, at least in part, on misconceptions. For example, it takes a freshman senator several years to get on to the traditions, procedures and customs of the Senatc. The Republicans labored under the disadvantage of having very few oldtimers in their ranks, and a disproportionately large number of their senators were brand new, and green as grass. Some of the Democrats of long standing took full advantage of this, and constantly tossed monkey wrenches into the creaking legislative machinery

Under these conditions, the Republicans did a good job in organizing their battalions and starting the wheels rolling. Much of the credit for this must go to Senator Taft, who, regardless of one's views as to his opinions, is an able parliamentarian.

In the all-important field of foreign affairs, the Republicans steadily maintained a bipartisan policy—due in large part to the leadership of Senator Vandenberg. The principle Executive recommendation, the Greek-Turkey aid bill, passed easily, with a minimum of debate. The appointment of Secretary Marshall was as warmly received by the Republicans as by the Democrats. Thus, the GOP has donc its full part in helping this country present a united front to the world.

Biggest domestic issue in the Republican program was a labor bill. The bill finally produced may be imperfect, but it is difficult to see how a better piece of legislation could have been written on so controversial a matter. The Republican leadership was most effective. Considering the importance of the subject, the time consumed in ironing out the wide differencces between the original House and Senate versions was not excessive. GOP party unity and discipline was remarkable—only three Republican senators voted to sustain the President's veto. All in all, that is a considerable achievement.

It is apparent now that Mr. Truman plans to use the labor issue as a major campaign argument when he runs next year—and everyone is certain he will be the candidate. But the record of his party members on the labor bill will be a weakness so far as he is concerned. In the final Senate vote, nearly as many Democrats voted to override the veto as to sustain it. All his efforts to promote party solidarity in this matter were unavailing, and thc split was virtually complete. This was not the fault of the Democratic floor leaders, who did everything to gain support for the President. Sentiment just ran the other way.

The Republieans promised a tax reduction bill, and they delivered the goods in this as well. The great majority of the party in the House voted to override the Presidential veto but they simply didn't have enough votes. Regardless of the wisdom of tax reduction now, the party leadership was excellent.

The tax question will also loom large next year. It is significant that many bservers who were opposed to tax reduction on the grounds that reduction of the debt should come first, did not like the President's reasons for vetoing the bill. He laid particular stress on the theory that it favored the rich at the expense of the poor. This, say the Republicans, is not true, and is an attempt to gain the votes of people who are not conversant with the facts. Some also belive that the President vetoed the bill so that he can propose a tax reduction measure of his own next year and gain whatever political profit may be involved. That remains to be seen, but it is true that the veto message was so worded as to make tax reduction seem a possibility for the near future.

With Mr. Truman's nomination by the Democrats a seeming certainty, the various forces within the Republican party are getting down to cases in grooming candidates. A little-noted fact is that the labor bill was, in some measure, a victory for Governor Dewey. Most of the job of framing the final version was done by Senator Ives of New York who is very close to the Governor and is believed to reflect his point of view. It is apparently the kind of bill Governor Dewey believes fair and workable.

Senator Taft seems to have increased his lead over most of the other prospective candidates. He is very strong in the potent Middle West, and he has a good following in the industrial East. But the opposed Taft and Dewey forces could conceivably eliminate each other at the convention. That is why some commentators feel that there is a distinct possibility that neither may be the candidate.

In the meantime, talk of a third-party seems to be growing. Its advocatcs say that the Republicans are hopelcssly reactionary, and that the Democrats are weak, ill-disciplined and vacillating. Some curious third-party tickets have been proposed, one of them being Henry Wallace with Elliot Roosevelt as second man on the ballot. Very few people, however, take this kind of talk too seriously.

The Ultimate Challenge

It has becn said that hunger and cold are communism's most efficient allies. That aphorism underlies the present United States foreign policy with its emphasis on material aid to nations threatened by Soviet diplomatic and economic aggression.

France is a perfect example of this. France must have two basic materials from the United States—and if she doesn't get them from us, the way will be paved for her complete descent into totalitarianism. One of the commodities is wheat—France's own crop will be only about one-fifth of her normal prewar crop. The other commodity is coal—and, to quote a Life editorial, "Coal for France means the difference between just getting by and utter industrial collapse."

Fortunately, the United States will have a bumper crop this year, and filling France's requirements will not be an excessive drain. Coal, however, is another matter. We have plenty of it in the ground. But it cannot be used to aid France or to serve ourselves unless the miners get it out. To quote Life onee more, "The man who burns coal in Main Street must understand why he must conserve just as clearly as John L. Lewis must understand the necessity of avoiding a coal strike." If we fail to deliver the coal, we will be playing straight into the hands of the communists. If France ever enters the Soviet orbit, the Iron curtain will soon cover all of Europe.

What this amounts to is that American materials are now a diplomatie weapon. If the greatest democratie power in the world eannot sueeor distressed peoples, strieken nations will turn to the greatest dictatorship in the world, and the cause of human freedom will be irretrievably damaged. H is the ultimate challenge to American industry—and to American labor.

Fat Calf Tour Helps 4-H Boys

On a recent tour conducted by County Agents C. G. Leslie and J. T. Bulls, Jr., 4-H Club members of Lauderdale and Colbert Counties of Ala., made a close study of fat calves owned by each member on the tour.

Each calf was classified on the basis of eight at withers and heart girth measurements. Steers owned by boys who had met feeding and sanitation requirements graded good and better. These calves had made rapid gains.

The tour inspired boys to do a better job, and all club members pledged to follow feeding practices more closely and do a better job of handling their calves.

Perry County Club Members Observe National 4-H Week

"Working Together For A Better Home and World Community," was the theme of National 4-H Club Week, March 1-9

Throughout Perry County, Ala., 4-H Clubs held special meetings during that week. Demonstrations were given and exhibits were shown at meetings. The importance of 4-H Club work was stressed and boys and girls who were not members were invited to join a club. Junior neighborhood and adult leaders did a good job of showing the meaning of their theme.

Parents were invited to the club meeting during that week. They learned more about 4-H Club work and what it means to boys and girls.

Perry County's 885 4-H'ers have pledged to do more for home, community, and county.

Up to the Community

The Action Program developed at the President's Conference on Fire Prevention is now being put into effect. A basic need, which is essential to the success of the entire program, is to overhaul laws and law enforcement procedures as they apply to fire.

Every state and community should at once initiate a study to determine whether its fire prevention regulations are so antiquated as to create perils to life. Many such codes are a generation or more old. Thousands of communities have no codes whatsoever This lack amounts to a constant invitation to destructive fire.

Secondly, every state and community should create a continuing advisory board to make recommendations to keep the regulations up to date. As new materials and new engineering techniques are developed, they should be incorporated into law.

Lastly, the key to the whole problem is rigorous enforcement of safety laws and building codes. The best code ever devised is worthless if enforcement officials allow it to become a dead letter.

There can be no excuse for states and communities which fail to discharge their responsibilities in these vital matters. The life and property of every citizen is at stake.

Fourth-Grade Arithmetic

A trade magazine which deals with retail distribution, recently said: "The assertion or implication that prices are excessively high and could be reduced if it were not for the greediness of distributors, the old outcry against 'profiteering', is certainly untrue and unfair so far as the chains are concerned, and, because of the competition which the chains offer, can be true only in rare instances outside of the chain store field." It then cited the case of an advertisement of a banana importing company which pointed out that it charged only 5½ cents a pound for the fruit at ports, while the consumer had to pay 15 or 12 cents a pound in retail groceries. What the advertisement didn't say was that practically all of the spread was absorbed by unavoidable handling and overhead costs, and that the grocer's profit is extremely small.

The fact is that if grocers earned no profit whatsoever, an obviously impossible situation, the saving to the average family would be a microscopic percentage of its monthly food bill. And this is true of retailing in many other fields. Some lines, where spoilage, seasonal goods and other such factors are involved, must allow a greater margin. But this spread is held to a minimum by competition. Every store has its competitors down the street who are eager to get its trade. The chain, the independent, the super-market, the specialty shop, the department store, the mail-order house, every one of them is in direct competition with all the others. And the store which offers the lowest prices or the best service or the largest stocks or whatever else consumers want, gets the business.

Retail prices will come down when, and if, wholesale prices come down. Wholesale prices will come down when, and if, production costs decline. That is the fourth-grade arithmetic of the situation, and there's no sense in trying to avoid it.

An Effective Force

If anyone believes that retailers are principally concerned with how to dredge more dollars out of price-conscious consumers, he should read the reports of recent conventions and meetings attended by leaders in the merchandising field.

The most intense attention has been given to ways and means of preventing further price increases, and to reducing prices whenever possible. Equal attention has been given to the possibility of improving the quality of goods—which, if achieved, is in itself a form of price control.

In the day by day course of business, retailers have been working closely with manufacturers on these related problems of price and quality. The objective is to reduce costs in every possible direction—and to pass the saving on to the buyer.

It is difficult for the individual consumer to measure the results of these undertakings. All he knows is that the cost of many articles has continued to go up, and the cost of relatively few articles has come down. But it is unquestionably true that, had it not been for the work of the retailers, prices would have been substantially higher than they actually are. And this is a very positive achievement in the interest of the public pocketbook.

Four-H Thrift Helps Family

Zephlyn Bailey of Lane Springs Community has made her 4-H Club projects very helpful to her family.

She carried three projects last year—food preservation, home improvement, and cotton. Money from the cotton project was used to carry out some of the other plans that she had in mind.

She knew that her family needed a home orchard. So she used a part of her cotton money to start one. She began with 12 peach trees, three pear trees, three apple trees, and a number of grape vines. She plans to increase the number of different fruits in the orchard.

Zephlyn didn't take meal preparation as a project last year because of a poor cook stove. However, she wanted to take a part in meal preparation so much this year that she gave $25 of her cotton money to help buy a new stove.

Zephlyn is an active member of her club and is treasurer of the county 4-H club eouneil.

THE FORUM

The Modern Farmer

Published monthly by the Modern Farmer at Nashville 3, Tennessee.
Giles A. Hubert,---------- Contributing Editor
Sadie Wilson --------- Secretary
Henry Allen Boyd_.--- Publisher
Office, 403 Charlotte Avenue.

Devoted to the interests of the Farmer, Truck Gardner, Livestock and Poultry, Breeder, the Home and the People.

Entered as Second Class Matter, April 10, 1929, at the Post Office at Nashville, Tenn., under act of March 3, 1879

All contributions for publication in the Modern Farmer, should be addressed to The Modern Farmer, 403 Charlotte Avenue, Nashville 3, Tenn.

No libelous matter will be published. Unsigned articles or letters, and those written on both sides of the paper will not be used.

Subscription price $1.00 per year, 75c for six months, payable in advance. Personal checks must be certified. Make all checks or money orders payable to The Modern Farmer.

Advertising rates and sworn circulation figures presented upon application.

USDA Issues

(Continued from page 1)

smaller numbers in proportion.

Many migratory farm workers who have already been working in strawberries in Ark., a little later may be detasseling hybrid seed corn in Indiana, Illinois, and Iowa or picking cherries or peas in Wisconsin. By early August they will be picking tomatoes and harvesting sweet corn in those states and Iowa, then moving on to Ohio or Michigan to pick cherries or more tomatoes, or to Wisconsin for cherries, sweet corn and cucumbers, or it may be to the sweet corn field of Minnesota and Wisconsin. Blueberries will also await pickers in Michigan.

September, as indicated in the guide charts, is the middle harvest month for peaches, plums, pears, tomatoes, and many of the root crops in Michigan. Sugar beet harvests follow by October, which is also harvest time for many vegetables and for sugar beets and potatoes in other northerly states of the region. The harvesting of muck crops including onions, potatoes, is carried on in the Lake states until late in the fall. Sugar beet work may last through November.

Through the fall months some of the human tide moves southward to pick cotton from southeastern Missouri to the Gulf. Rice harvest in Louisiana begins late in August and continues into early November; sugar cane from mid-October through December. This year ends with the picking of tung nuts in Louisiana and Mississippi.

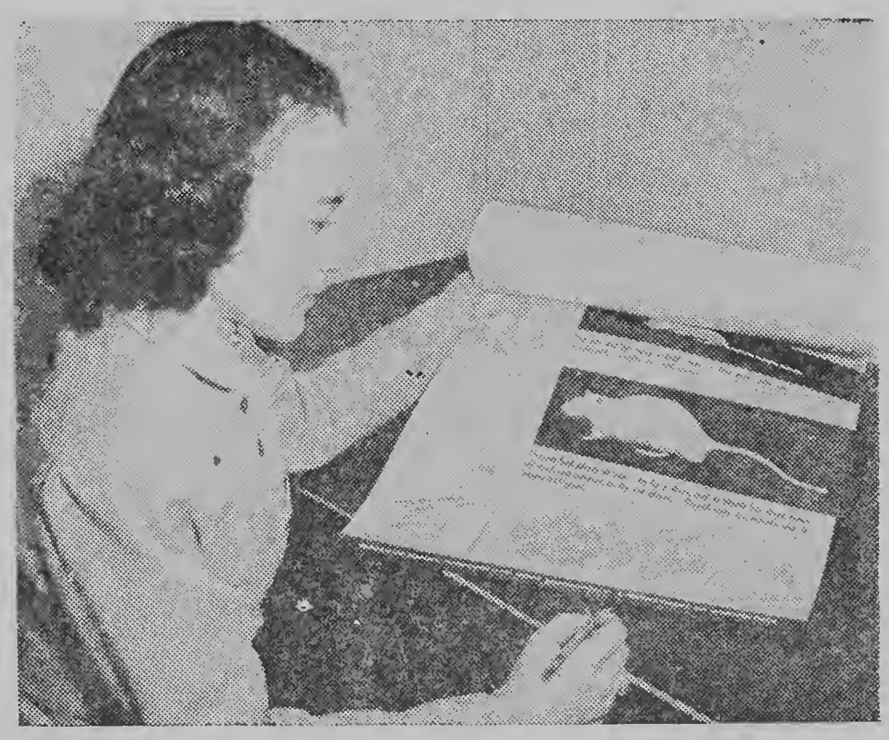
Byrd's Nest

(Continued from page 1)

aim of a vast majority of the human race. Even barbarians, and men of idolatrous nations seek divine security. The barbarian of the worshipper of idols may be far off the right track, but according to his own understanding, he is trying to please a God that the proper relationship may exist between him and his idol. I respect the desire of all men's seeking in various fields of religion, but I pity the ignorance of millions who seek divine security through secular means. Such seeking cannot be confined to the dark regions of India, China, Africa, and Japan etc. there are millions of profess Christians who seek divine security by carnal things and gestures. Jesus own words sustain the fore-going statement when he said. "Not every one that saith Lord, Lord, shall enter into the kingdom of Heaven." Divine security does not come by the enactment of human opinions or the establishment of human convictions, but rather by the carrying out of God's will. Divine security is the most mysterious kind of security and yet the most easily and the most quickly acquired. One needs but to accept of it and it is his. God has so fixed men that any and all may receive divine security. We are told, "Whosoever will may come."

The ark made of Gopher, in saving sheep, cattle etc., was making Noah and his family economically secure. The ark in saving Noah's sons and their wives was also guaranteing social security for the old patrioch. The ark in tiding life over the period typifies the divine salvation and security guaranteed by the church of Christ. In the ark, divine relationship was maintained between Noah and God.

Food Makes the Difference



Rats and guinea pigs tell the story of the importance of a well-balanced diet in an up-to-date series of 10 new nutrition charts which the Bureau of Human Nutrition and Home Economics of the U. S. Department of Agriculture has prepared as a visual aid for nutrition classes and wall exhibit use. Mrs. Edith B. Shepherd, Howard graduate, who is employed in the Department as a food economist, looks over the new charts. Sets may be obtained for 75 cents from the Superintendent of Documents, Government Printing Office Washington, 25, D. C.

New Visual Aid in Nutrition Teaching

Keeping pace with advances in nutrition knowledge, the U. S. Department of Agriculture's Bureau of Human Nutrition and Home Economics has prepared an up-to-date series of 10 nutrition charts, as a visual teaching aid for nutrition classes and wall exhibit use.

Food makes the difference, is the theme running through the entire chart set. Photographs of laboratory animals point the importance of well-balanced diet for normal development and growth. Well-fed white rats, sturdy, sleek, and lively, are contrasted with other white rats that show by weak legs, rough coats, stunted growth, or other signs that they got too little of some one essential in everyday food. Eight of the better known nutritients essential for growth are thus illustrted, and the importance of each—protein, iron, calcium and vitamins A. C. D. riboflavin, and thiamine—is simply told.

"Rats are used for nutrition studies," one chart explains, "because they will eat the same foods we do and quickly show the effects of good and bad diets. A rat grows up 30 times as fast as a child and usually lives less than 3 years."

In the case of one nutrient—vitamin C—guinea pigs replace rats be cause rats are not sensitive to a lack of this vitamin.

Rounding out the lesson on each nutrient are sketches of a number of foods, chosen for a double reason. Not only are they good sources of a given nutrient, but also studies of the national food supply show that they are widely available and commonly used.

The new, modernized charts, which are 19 by 24 inches and printed in yellow and black on heavy white paper, replace an out-of-print black and white edition which became a longtime best seller among the Bureau's educational charts.

Sold in complete sets only, at 75 cents a set, the nutrition charts may be purchased from the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

B. J. Murray Representing the Wings Over Jordan Choir

Long Island City, N. Y.- New York 22. Wings Over Jordan, the world's greatest Negro choir, has found a unique solution to one of the many problems involved in making a concert appearance in a different town every day of the year.

Ordinary an organization which must travel for performances has sufficient time between engagements to keep its transportation in good repair. This does not apply to WINGS OVER JORDAN because the demand for engagements cannot be met even though it has been on continuous tour since March of 1946. Rev. Glynn T. Settle, originator and director of the organization, faced the problem of disappointing sponsors who were planning a concert or making special arrangements for transportation.

Although, it involved a great deal of extra expense, Rev. Settle evolved a plan which keeps the choir on schedule for its performances. Wings Over Jordan bought two busses instead of one! Now there is always a bus overhauled and ready for service in the section in which the choir is touring. The two large GMC busses provide sufficient room to permit the choir to make its longest moves at night and arrive in good time for all performances. They are alternated at regular intervals to minimize danger of breakdowns which ordinarily plague traveling units.

This transportation plan is especially essential in the case of Wings Over Jordan because it is often necessary to travel several hundred miles to a studio of the Columbia Broadcasting System. Although the coast-to-cost broadcastings every Sunday at 11:05 A. M. EDST originate from a different city every week, Wings Over Jordan is always in the studio hours before broadcasting time.

This is another example of the planning that has made Wings Over Jordan a great Radio feature for ten consecutive years and a concert attraction in a class by itself.

Farmers of 12 States to Vie for Soil Conservation Awards

Colored farmers of 12 States are expected to compete for awards at the first annual South-wide Soil Conservation Jamboree to be held at Log Cabin, Georgia, on August 6, according to report received by the U. S. Department of Agriculture from Dr. B. F. Hubert, director of the event.

Elimination contests are now underway in several States. The 12 States which are expected to enter farmers in the competition are: Alabama Arkansas, Florida, Georgia, Louisiana, Mississippi. North Carolina, Oklahoma, South Carolina, Tennessee, Texas and Virginia.

USDA Soil Conservation Service is cooperating fully with the conservation effort. Colored SCS technicians are serving as judges in some of the State conservation contests, and SCS officials will take part on the Jamboree program.

Within the last three years the conservation contest which was orig inated in Log Cabin has grown from a county-wide to a South-wide event. Last year a State-wide jamboree was held for Georgia farmers. Dr. H. H. Bennett, chief of SCS, was the principal speaker.

Methodist Leaders Of Both Races Made Delegates To E. M. C.

Springfield, Mass. (Special) Bishop Paul B. Kern, Revs. M. S. Davage, A. J. Walton, Roy A Short, Hoover Rupert and Lee Davis, of Nashville have been named among the 270 delegates who will represent American Methodism here in the coming world gathering of followers of John Wesley, from September 24 to Oct. 2

Known as the Ecumenical Methodist Conference and embodying all branches of Methodism on the five continents, these conferences have been held at 10 year intervals since 1881 until the war made impossible the 1941 session scheduled for Oxford, England.

Current food and housing conditions abroad compelled the transfer of the postponed session to the United States.

Fifth delegates are expected from the Mother church in England and smaller numbers from the Methodist denominations of Australia, New Zealand, South Africa and some Latin American countries where Methodism is independently organized. Delegates will come also from mission lands.

The conference does not have legislative power but wields strong influence in shaping world-wide Methodist opinion and policy.

Naval Stores Workers

(Continued from page 1)

per day. And Forest Service officials report that in many turpentine areas the growers have replaced the traditional backwood labor shacks with modern cottages. It is also said that many of the workers now have gardens, chickens, pigs, and milk cows which enables them to eat better and save more of their earnings.

By the new method of turpentining which is described in a recent publication, Farmers' Bulletin No. 1984, the worker sprays a diluted solution of sulphuric acid on the streaks of the tree "faces' immediately after chipping. A "face" is a series of cuts or streaks which are made on the side of a tree to keep the gum flowing. The acid makes more gum flow, and makes it flow longer.

Chipping off only the bark of the tree in making the "face" instead of chipping into the wood is also part of the new method. Both of these techniques save time, which means an over-all reduction in labor costs, and they leave the worked trees in better condition for sale as timber.

Without the use of acid, new streaks have to be chipped on the "faces" every week in order to keep the gum flowing. But with the acid treatment of the streaks, gum often continues flowing for as long as three weeks. Thus, instead of one man working the same "faces" every week, he may work different "faces," repeating only every three weeks instead of every week.

For example, by the old method, a man could tend only 5,000 faces a season because he had to chip the same "faces" every week, but with the new method he can tend about 12,000 "faces", chipping and spraying at three week intervals. By the old method his season's production was only 100 barrels of gum. By the new method his output may average as high as 210 barrels.

Because labor requirements with the new method are less, the "crops" (10,000 faces) of workers who have gone to urban centers have been divided among the 18,000 workers who remain in the industry. Before the war there were over 30,000 naval stores workers. Negro workers make up a large percentage of the labor force.

The pine forests along the coast from the Carolinas to Texas comprise the naval stores region of this country. Each year about 500,000 barrels of gum turpentine and 1,500,000 barrels of gum rosin are produced. Wood turpentine and rosin are produced by the distillation of the roots and stumps of pine trees.

Naval stores are used in the manufacture of many important products. Among them are paint, varnish, printing ink, shoe polish soap paper, roofing, matches, perfumes, and pharmaceuticals.

All gum naval stores are not produced by large growers who hire a labor force to work their trees. Many small farmers in Georgia, South Carolina, and Florida work their own trees. With gum now selling at around $30 per barrel, hundreds of small white and colored operators find naval stores an important crop. The Farmers Home Administration has loaned some farmers money with which to buy equipment to work their own trees.

The history of naval stores in America goes back to Jamestown colony where a thriving industry was developed by supplying early American traders with tar and pitch for their sailing vessels. The tar was used for preserving the hemp cordage and rigging of the ship, and the pitch for calking the seams in the wooden bottoms.

Hold Training Course in Forestry for Miss. Colored Farm Agents

The 40 Mississippi colored county agents who will direct the 4-H woodland improvement contest, sponsored by the Gulf-Mobile and Ohio railroad, have been given intensive training in forestry, according to reports received by the U. S. Department of Agriculture from the Mississippi State Extension Service.

Tree marking for selective cutting, timber estimating, and evaluating were included in the course which was directed by J. S. Therrell, associated extension forester. He reports that the agents were enthusiastic about the training and the 4-H contest. Also, he says that the agent's interest in forestry will greatly increase the participation of colored farmers in forestry development in Mississippi.

The 4-H clubbers who enter the contest will carry out standard improvement practices on one-acre plots. Winners will be awarded $1,000 in prizes. Eight of the winners will receive four-day trips to Tuskeee.

Founder of Georgia Ham and Egg Show Promoted

Otis S. O'Neal, founder of the nationally famous Georgia Ham and Egg show, has been promoted to a State-wide position as special agent in charge of Negro work.

In his new position, Mr. O'Neal will devote his full time to assisting the county agents of the State in developing county-wide ham and egg shows.

Mr. O'Neal, who is a graduate of Tuskegee, held his first show at Fort Valley in 1916 Only 27 poorly trimmed, ragged hams, shoulders, and sides were displayed along with 17 dozen dirty ungraded eggs. But the few farmers and their wives who attended caught the vision. For the first time they saw dignity in curing meat and in selecting and cleaning eggs, says Mr. O'Neal.

Through 30 years the show has grown into a national event. Nearly a thousand excellently cured and trimmed hams are now displayed along with hundreds of dozens of top grade eggs. In 1945 Life magazine covered the show, and in 1946 it was covered by Readers' Digest, Coronet, and the Columbia Broadcasting Company.

Working state-wide, Mr. O'Neal will stimulate increased preservation of meats, and also will seek to secure the adoption of a single curing formula, says Mr. Stone, in this way, all Georgia home-cured hams would taste the same, and the State would be on its way to producing a ham that could compete with the Virginia ham, a long-time ambition of Georians.

Vets Preferred For 3,700 Acres To Be Made Homesteads

Sacremento, Calif.-(Global)-The Bureau of Reclamation announced last week that 3,700 acres of rich bottom land in the Tule Lake district of northern California would be opened to homesteading about Oct. 1.

The land is located in Coppeck Bay area of Tule Lake, near a 7,500-acre unit awarded 86 veterans last December after a drawing. These veterans are now harvesting a bumper crop of barley, seed clover alfalfa and potatoes.

Veterans of World War II will receive preference in filing during the first ninety days of the availability period. The 3,700 acres would provide 46 farms.

During the war, Tule Lake was the site of a Japanese relocation camp.

A genius is a man who shoots at something no one else can see and hits it.

Tenn. State "Tigers" To Meet Arkansas At Memphis, Sept. 19

On Paper, "Lions" Appear To Be Formidable Foe Against Coach Kean's 1947 Entry; Game Will Be Big "Charity Classic"

By C. J. KINCAIDE

The football season gets under way down in Dixie, September 19, at Memphis, Tennessee, when the Tennessee State Tigers, National and Mid-Western champions respectively meet the powerful Arkansas State College Lions, members of the Southwestern conference. So early in the season will all eyes and ears of the football coaches and fans be turned on the Charity Classic. Many of the national sports writers and thousands of fans will pour into Memphis to see in action these two very fine teams, Tennessee State, coached by Henry Arthur Kean and Arkansas State, coached by Lamar Allen. These two teams will be just like their two coaches, they will highly respect each other because of their last year's record.

Well folks, those of you who might predict Tennessee State as the favorite should pause long enough to consider two teams which played both Arkansas State and Tennessee State last year. Arkansas State beat Southern University (second best Negro grid team in the country in 1946), by the score of 9-6, while Tennessee State just barely eked out a 21-20 victory over the Louisiana lads. Tennessee State defeated Langston University 26-0, however the Arkansas State Lions took "Zip" Gayle's Oklahoma gridders into camp to the tune of 25-0.

Now this writer has known of several football classics in the past, however, this gridiron clash is the first of its kind, in that one-third of the net proceeds will be given to Negro charitable organizations, including Tri-State Boxing, Milk Fund, Elks' Christmas Basket Fund, YMCA and YWCA, Boys and Girls Scouts, Tri-State Fair Association, finally scholarships will be awarded to worthy students now enrolled or desiring to enroll at Arkansas State, Alcorn A. & M. College and Tennessee State College. Our hats go off to President W. S. Davis of Tennessee State and President L. A. Davis of Arkansas State for engineering such a game. When the fans come to see this contest, they will also have the satisfaction of knowing that they had contributed directly to a worthy cause in helping the less fortunate Negroes in this Tennessee, Arkansas area where it is most needed.

Education is Tool For Good or Evil Graduates Warned

Wilberforce, Ohio.- Summer graduating seniors of the College of Education and Industrial Arts at Wilberforce university, today were challenged by Dr. Clyde Hissong, state director of education, to make practical use of their college training.

In his commencement address here this evening, Dr. Hissong described a college education as a tool for good or evil, depending upon how well each graduate used "the extremely valuable tools of knowledge" gained through scholarship.

"The purpose of any tool," Dr. Hissong said, "is to fashion something Any craftsman knows that a tool justifies itself only when it helps to fashion a better instrument than itself."

Dr. Hissong stressed the fact that scholarship in our American way of living is only the beginning of practical accomplishments that should lead to better living for everyone. He explained that college graduates have the responsibility for leadership in promoting better living and that each graduate must cultivate "a personal magnetism that will generate respect for your ideas, belief in your personal integrity, and faith in your social vision."

"Above all," Dr. Hissong concluded," scholarship must exemplify tolerance and understanding between individuals and among nations, if we are to be able to avoid costly wars, both worldwide and regional, in the future."

Guadalupe District Association

Forty-fourth Annual Session Held in the West End Baptist Church in San Antonio

San Antonio, Texas—(Delayed in Transmission)—After being in session here at the West End Baptist Church, Rev. J. A. Kemper the entertaining pastor for five days, the Guadalupe District Association closed out its seventy-fourth annual session, which was regarded as the greatest ever held in the Association's history. The meeting here in the Alamo City.

loaded and drew representatives from throughout the district. The major objective of the convention is not only home and foreign missions, but Christian education.

The moderator, Rev. D. Manning Jackson, D. D., was re-elected to succeed himself. He is one of San Antonio's dynamic ministers, pastors theologians and teachers. He has such able men on his staff of officers as Revs. S. E. Stewart, C. B. Everage, R. L. Murray and M. C. Arnold. The association was highlighted by the religious, spiritual and denominational fervor that made it an occasion long to be remembered. The finances reported raised through the session were $4,580.00. The appropriation committee reported to the Association its recommendations for disbursements for various denominational causes, but the major portion of its educational money was divided equally between Mary Allen College at Crockett, Texas and Guadalupe College at Segin, Texas.

One of the highlights of the convention was the annual address of Rev. D. Manning Jackson, who stressed "The 10 F's That Make for our Furtherance and Freedom." It was in mimeograph form, and was distributed to the messengers before he began his delivery and as he was being presented by the vice moderator.

D. C. Theatres To Continue Policy Of Discrimination

Washington, D. C.-(Global)-Despite the tremendous pressure being brought to bear against it, the National Theatre, the only legitimate theatre in the Capital; will continue to bar Negroes unless the racial policies of the entire City are changed, the management intimated, last week.

Marcus Meiman, president of the operating corporation, in a statement, said that the theatre's present policy would be changed only if, the general policy (toward Negroes) is changed in Washington by legislation, or if business and civic groups revoke racial restrictions.

His statement came in the midst of contract negotiations between the League of New York Theatres and Actors' Equity. Equity is demanding a contract clause which would forbid its members to appear at the National Theater unless exclusion of Negroes is stopped by June 1, 1948.

Religious Leaders And Educators of Nation Strongly Oppose Measure Advocated by Military Forces; A Stirring Fight Over Issue Begins

WASHINGTON, D. C.—Governor Thomas E. Dewey may have lost ground in his race for the Republican nomination for the presidency as a result of espousing the proposal for peace time conscription, at the American Legion National Convention in New York, last week. By so doing he broke with his party's congressional majority and is believed "played into the hands" of Senator Robert A. Taff, his chief opponent for the presidential nomination.

Gov. Dewey's stand for peacetime conscription, which euphoniously is called "universal military training", is the one and only stand on major issues he has taken which has disturbed colored voters, who all along have been overwhelmingly for his nomination and election to the presidency. There is hardly a single organization of colored persons in the country that is not openly hostile to peacetime conscription. The Negro press is generally opposed to it and even the National Association for the Advancement of Colored People which under the guidance of Secretary Walter White has been a partisan supporter of all "Truman doctrines" was forced to go on record against "universal military training" at its annual convention this year.

Mr. Dewey's stand for conscription, it is being said, would make another tweedledee, tweedledum race for the presidency in 1948 should he be named as the opponent of President Truman, and should the Republicans in their 1948 National Convention refuse to endorse "universal military training" and yet nominate Mr. Dewey for the presidency, that would put the Republican candidate in an embarrassing position. The most ardent supporters of Gov. Dewey, are as loyal to him as ever, but they are stunned as a result of his expression putting him in association with all of the fascist elements of the country, since all these elements are in the forefront of the movement to turn this government over to militarists and warmongers.

It is realized that Gov. Dewey will gain in prestige with special interests and also his popularity in the Gallup polls may mount higher and higher in the doctor's future figures, but none of these "advantages", it is held will affect the hard-boiled delegates to the next Republican National Convention. These delegates will likely refuse to repudiate the position taken by the Republican majority in congress against peacetime conscription.

Mr. Dewey's New York friends it is understood, are betting on the Republican majority changing its position on peacetime conscription at the next session; they hope before the National Convention is held that the party in congress, will be driven to pass the bill for conscription. If that is done, then Mr. Dewey will be in a stronger position than he is now, in announcing support of a measure which the Republicans have not endorsed and at present seem unlikely to endorse.

The friends of Senator Robert A. Taft, it is known, feel that Dewey has helped their candidate greatly, at a time when the Ohioan's prestige was low. The fight on the Taft Hartley labor bill, which has been subjected to an attack by the labor leaders that has flim-flammed a host of people and made them believe the bill "robbed labor of its rights", undoubtedly had hurt Senator Taft. But it is now probable that the Ohio senator will be able to regain lost ground by carrying to the people the peacetime conscription issue and rally the nation's majority which undoubtedly is opposed to this totalitarian proposal. Taft undoubtedly has the power to prevent the passage of peacetime conscription in the United States Senate. And should he get the Republican presidential nomination he would be in a position to make a race for the presidency on a clean cut issue which would put President Truman and the Democrats on the defensive

Peacetime conscription is opposed by most of the religious denominations of the country and most of the nation's educators and teachers. It is backed only by warmongers and the bosses of those veterans' organizations that maneuver to keep the rank and file from having any say in the policymaking of such organizations. It is doubtful if the hullabaloo created at the American Legion Convention in New York favorable to peacetime conscription is endorsed by twenty-five per cent of the rank and file members of the legion. Senator Taft realizes this just as he knew the rank and file of labor did not want to be forever engaging in strikes merely to give labor leaders a chance to pose as powerful political figures.

Back in December, 1943, the members of congress were given the real "low-down" on the reason why there is so much agitation for "universal military training," it came from a GI. His name was George L. Mark, a father of three children, who at the time was in Camp Atterbury, Md. Mark went to Washington and appeared before the committee that was considering the conscription bill. In a prepared speech, opposing the bill, Private Mark said, "universal military training" was the brain child of the Pentagon Boy Scouts, the be-medaled four-flushers, the brass hats and the aristocratic phonies of the Pentagon caste." He was referring to the military men who occupied the war department headquarters in the Pentagon Building in nearby Virginia.

Private Mark said the "brass hats" wanted universal military training because they want a large army, so that army officers can keep their soft jobs. "These brass hats don't like work. If they did they wouldn't be in the army. They're in the army as officers because they cannot make a fight in the competive game." Thus spoke this game Buck Private., and his speech was the most sensational expose of the plan to conscript the youth of the nation that was made during the hearings on the bill.

Private Mark further stated that the military clique was making life miserable for enlisted men so that they would not re-enlist; that the military clique had undermined voluntary enlistment solely because they wanted to force congress to adopt compulsory military training. Mark said he did not believe compulsory military training is democratic. He said it would undermine the morals of the nation's youth and eventually bring about a militaristic control of government and lead the country off to another war

Mark said that voluntary enlistments could produce all of the soldiers the nation needed for a peacetime army. He challenged the statements of Secretary of War Patterson and other army "brass hats" who had said the enlisted men wanted universal military training. Mark said letters he had received from his "buddies" in this country and from overses showed that they were against universal military training; that only the officer caste favored it.

Taft, in his contest with Dewey, it is believed, will make a powerful use of G. I. opinion regarding universal military training. Now as never before, politicians are concerned with what rank and file war veterans think about military training. But Mr. Dewey, it is charged, is thinking only of what the officer clique and heads of the leading veterans' organizations think. These army officers, as Private Mark disclosed, are thinking only about the soft and easy jobs they can keep if they can get a big army of school kids to boss.

LIFE

Life isn't always sweet,
Nor does the bitter remain;
Paradoxical as it may appear,
Rarely we're heroes in shame.

Third Annual Fat Calf Show Held in Montgomery Tops All Records—Much Interest Shown

"Joe" the Aberdeen Angus calf owned and shown by James Brown of Greene County, paid his owner $1,975 in sale and prize money by winning the grand championship of the third annual fat stock show for Negro youth held in Montgomery, April 8-9.

Keen competition was offered by the reserve champion calf of the show, a prize Hereford steer owned and shown by George Yarbrough Jones of Epps in Sumter County. George's calf was bred and fed on the farm of his grandfather, Cal Jones, from whose herd many winners have come.

Highlight of the two-day event was the sale of the grand champion by the Honorable James E. Folsom, Governor of Alabama, who said in a preliminary statement, "Alabama's progress depends 40 per cent upon the progress that Negroes make, as they constitute that per cent of the population." He further commented upon the high quality of Negro 4-H and NFA boys and girls as evidence of progress being made.

Governor Folsom took the gavel at 9:45 a. m., and by 9:48 had run up a record bid of $2 a pound for the grand champion steer. The calf was bought by Boyd Leyburn, manager for Sears Roebuck and Company's store at Montgomery. He represented the Montgomery Chamber of Commerce and several business firms. The prize-winning animal was donated to the Montgomery Tuberculosis Sanitarium.

This third annual show topped the first and second years' shows by a wide margin. According to J. R. Otis, state leader for Negro extension work, 255 calves were entered in the show as compared with 130 in 1946 and 32 in 1945. The quality of animals was in like manner far out in front of the previous shows, although prices were lower, he said.

More than 3,000 spectators crowded the stands at the Union Stock Yard to witness the judging of the show by Dr. R. S. Sugg, State Veterinarian from Auburn. The day of the sale brought an even larger crowd of cattlemen and spectators.

Visitors from out of state included Wayman Johnson, assistant director of state extension work for Negroes. of Orangeburg, S. C., with a party of three; Sanford Lee, county agent of Macon, Georgia; and Miss Singleton of the Macon Telegraph and Evening News. J. L. Lawson, assistant director of API extension service, W. H. Gregory, extension livestock specialist, and others from Auburn were present to give a helping hand.

T. M. Campbell, field agent of the U. S. Department of Agriculture, delivered an inspiring message at the annual banquet Tuesday evening. "What we saw at the fat stock show today proves that our boys and girls have accepted the challenge to meet the changing conditions brought about by farm mechanization and are pointing the way to a future brighter than the traditional cotton economy of the South," he declared.

Oher prominent visitors to the show included R. E. Cammack and J. C. Cannon of the State office of Agriculture Education; Robert Durr, editor of the Birmingham Weekly Review, and others.

The annual fat stock show is sponsored by the Montgomery Chamber of Commerce, the Agricultural and Livestock Committee of the State Chamber of Commerce, and Union Stock Yards Company of Montgomery, in cooperation with the Alabama Extension Service and the Department of Vocational Education.

While the margin of profit did not reach last year's sale on individual calves, the total sales value of $41,000 plus $1,000 in prizes gives a record gross return.

Electric Power Used Wisely on Montgomery County Farms

With the extension of electric power lines into the rural sections of Montgomery County, 30 different communities are using electricity in one or more forms. There are more than 30 rural churches and schools now making use of educational motion pictures on the use of electricity.

A large percentage of rural homes are being benefited with radio programs because of the extension of power lines into the rural areas of the county. The progress of radio users runs side by side with the extension of electricity into every type of rural home. Landlords are seeing to it that all houses of wage hands on their plantations are wired and connected in order that electric service may be extended to them.

The more progressive farmers are installing water systems powered by electricity. These systems are serving both the family and livestock. Dairy farmers are using electricity in dairy barns.

Other uses which farmers are making of electricity inclule refrigeration, brooding chicks, ironing clothes and operating shop motors, fans, churns, wood saws, and milking machines. Through these and other means, electricity is bringing a more abundant living to many farmers.

New Farm Housing Bulletins Tell How to Plan Remodeling

For farm families thinking of remodeling their home, or building a new home from the ground up, there is practical guidance in two new publications prepared by the U. S. Department of Agriculture housing specalists.

Title of one of the new publications is "Your Farmhouse: How to Plan Remodeling." It tells in words and in before—and—after pictures what members of one family actually did to make their old house more comfortable and convenient inside and out. The principles of farmhouse remodeling are presented in this bulletin. They start with the first major decision which must be made: Is the old house worth fixing over, or not Price of this bulletin is 15 cents.

Title of the other bulletin is "Your Farmhouse: Cut-outs to Help in Planning." This publication provides diagrams of beds, stoves, and other standard pieces of furniture and equipment. It also provides structural features, such as closets and stairs, all drawn to scale. By pinning the cut-outs on paper, a family can develop its own house plans; they can try out new iedas, and draw rough plans that will give the builder or architect a definite idea of what the family wants. The price of this bulletin is 25 cents Both publications may be obtained from the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

Sport Magazine Carries Story On Jackie Robinson's Success

New York—"If you were Jackie Robinson," says the current issue of SPORT Magazine, "you'd notice that every day there were fewer 'incidents,' that every day you were getting better breaks from the fans, the players and the press."

In a revealing story of Jackie's historic making of the big time in baseball SPORT states that Robinson's obstacles are steadily declining but that he still has many lonely moments.

Summing up Jackie's first months in baseball, the story written by Roscoe McGowen of the NEW YORK TIMES, who covers the Dodgers, points out that the Brooklyn star knows by now that the sweat he is pouring into his efforts to pave the way for members of his race in major league baseball isn't being wasted.

"Some nice things have happened," Jackie told McGowen. "It was nice of Hank Greenberg to speak to me as he did once when I pulled up at first base.

"You're doing fine he told me—keep your chin up. He's a fine gentleman."

According to SPORT, Robinson is paying quite a price for the privilege of playing baseball in the major leagues but he thinks it well worth the price.

Four-H Members Help Improve School Building

The 4-H'ers and older youth in Graham Community, Randolph County, have started a program to remodel and paint their school building.

It is an old Rosenwald school that at present is somewhat in need of repair. The youth and local leaders discussed their plants with the county agents, and members first started raising funds by giving money themselves. Later the 4-H boys and girls selected a one-acre plot of the school's land to grow an acre of cotton. When this cotton is sold, the funds will be used to buy paint and shrubbery to improve the building and grounds.

The farmers agreed to let the 4-H'ers use their work stock and tools, and to help them with the project.

The county agents will give the club members information on planting, cultivating, dusting, harvesting, and marketing the cotton.

Arkansas Professor Chosen Teacher At College In Ohio

Wilberforce, Ohio, -Leonard C. Archer, chairman of the department of English, Ark., state college, Pine Bluff, has been appointed chairman of the new department of speech and dramatics in the Wilberforce college of education and industrial arts, President Charles H. Wesley disclosed today.

A graduate of Morehouse college, Archer received the M. A. degree at the University of Toronto, Canada, and has done additional work in speech and the theatre at Atlanta university and the University of Wisconsin.

In 1943, Mr. Archer was winner of one of the "Dr. Christian Awards" for original radio script. His one-act adaption of Ann Petrey's novel, "The Street," won high praise at the Southern dramatic festival recently. Also, Archer appeared in the roll of the Fourth Tempter in the University of Wisconsin production of "Murder in the Cathedral."

Vice-president of the Southern Association of Dramatic and Fine Arts, Archer has taught previously at Bethune-Cookman college Georgia normal college, Alcorn college, Southern university, and Arkansas state college.

A little lemon or orange juice mixed into many sandwich spreads not only improves the flavor, but thins the mixture for easier spreading. Try a dash of orange juiee in cheese spreads, ham or other mineed meat spreads, or in peanut butter.

West Ky. Vocational School At Paducah

Acting President M. J. Sleet Announces New Additions to Teaching Staff

Paducah, Ky.,-(Special)- The doors of West Ky., Vocational Training School will swing open for the ninth consecutive year when students begin registering the morning of Sept. 9th.

The students and faculty will be greeted with complete rearrangements of all of the trade departments, and an almost complete renovation of the physical plant. Much painting has been done to the interior of the trade departments, and the dormitories will be in readiness upon the arrival of the avalanche of students.

The administration, as stated by Acting President, M. J. Sleet, has not confined it's effort only toward an improvement of the physical plant, but much time has been given over to the strengthening and improvement of the quality of the instructional setup. Attention to this phase of the school's program will also continue to receive sincere and careful attention, he says.

The following new persons have been added to the faculty: Mr. L. S. Hunter, of Louisville, will return as head of the Barbering Department. Mr. Hunter left the institution to join the army of World Waar II and his return will be heartily acclaimed by the entire administration. He was the school's first Barbering instructor.

Mr. Davis H. Edwards, Jr., of Monroe, Louisiana, and a graduate of Tuskegee Institute, with the Bachelor of Science degree, will be added to the teaching staff of the Auto Mechanics Department He has had five years of experience as an Automobile Mechanic and comes highly recommended by Dr. G. B. Love, Director of the Auto Mechanics Division of Tuskegee.

Miss Mary B. Marshall, of Shelbyville, Ky., and a graduate last year in the capacity of Secretary.

Mr. Fred E. Drummond, of Newport News, Virginia, will head up the Tailoring Department. He is a graduate of St. Paul's Polytechnic Institute, of Lawrenceville, Va., obtaining a Bachelor of Science degree, with a major in trade education. He has on file in the school's office the most eomplimentary recommendation his Alma Mater could bestow upon any of it's graduates. Mr. Drummond also has the blessings of Hampton Institute. He has had two years practical experience as an operator of his own Tailoring esablishment.

Miss Alyce Simpson, of Frankfort, Ky., will assume the duties as Librarian and comes to us efficiently recommended by Mrs. Virginia Lacy Jones, Director of Library Service of Atlanta University.

Oil Burner Better Than Old Wood Stove

Mrs. Grandberry, leader in home improvement in Ebenezer Community, inspires many of her fellow elub leaders to do a better job in homemaking. She is making her home a more convenient and comfortable place in which to live.

Early this year Mrs. Grandberry decided to do something to solve her cooking problem. She found buying wood very costly because she did not own land. Therefore, she decided to change her wood and coal cooking stove to an oil stove. She had the fire box sealed and put in burners. Then she ran a pipe from a five gallon can of kerosene outside the house to the burners.

This homemaker found that she used only three gallons of kerosene per week at 12 cents per gallon. The total cost of putting in the oil stove was only $17. "There is no cheaper fuel." says Mrs. Grandberry "Kerosene is cleaner, more convenient, and eheaper."

In addition to the steps taken to improve her kitchen, Mrs. Grandberry has made draperies, bedspreads, and many other useful household articles from sacks.

Quarantine Imposed on Flower Importation

For the purpose of preventing the entry of injurious insect pests and plant diseases, quarantine destrictions have been placed by the Secretary of Agriculture on the importation into continental United States, Hawaii, and Puerto Rico of eut flowers from most foreign countries.

Among the countries affected by the quarantine which goes into effect on August 1 is Haiti which has been shipping eut flowers here by plane during the winter months. The order will not affect Canada Labrador, and Newfoundland, because insect pests and plant diseses likely to be found in eut flowers from these countries are largely common to the United States.

Red Bank 4-H Apron Project

The six new members of the Red Bank 4-H Club in Lawrence County selected clothing as their project this year.

The first articles they worked on were aprons. They used their activity period at school for working on their aprons, and their leader, Mrs. Elna Faqua, supervised the work.

Flour and fertilizer sacks were used by all of the girls. The sacks were first bleached and washed white, then the aprons were cut anl the designs were drawn on them The girls pioled their money to buy the thread. Enough thread was bought to embroider all of the aprons and extra thread went into their school sewing boxes.

In embroidering the aprons, the girls used satin, buttonhole, feather, lazy daisy, and outline stitches, and the French knot.

Hoe Only Enough to Control Weeds

A wise note to home gardeners: You need to hoe your garden only often enough to keep down weeds. Any extra hoeing is a loss of time and labor.

API extension gardner, J. C. Ford adds that hoeing and cultivating should be shallow. Deep cultivation is not only hard work, but it may injure plant roots.

Sharp hoes and sweeps on garden plows are ideal for the garden. They make it possible to scrape the top layer of soil and destroy weeds without going too deep.

Sacks Are Handy and Add Beauty to Homes

Mrs. Bessie Loveless, Barton Community in Colbert County, is really known to her friends as "the sack lady." She has used sacks in making more than 25 pillow cases, aprons, dresses, vanity sets, curtains, dish towels and rugs. To many of these artieles she added touches of color with bits of ginghams and dyes.

Mrs. Loveless says that the sack articles really come in handy around the house as well as add to the beauty of the home. She also says that working with sacks is a good way to rest the mind and pocketbook.

To Use New Weed Killers Learn to Spray Properly

By Dr. Floyd Bralliar
Garden Editor
The Nashville Tennessean

More and more people are writing in to inquire whether there is really any virtue in the many new weed killers recently put on the market.

Much experimenting has been done by both the Weed-No-More and the Weedone people and also by many of the state agricultural college people using 2, 4-D. As a result, there is no doubt that this material when properly used, will kill most broad-leafed or veined plants and yet will not damage most grasses.

Expect Too Much

Some users expect to spray with this material and have it kill their weeds in a few minutes. When it does not they are disappointed and condemn the material as worthless The proper time and way to use this material is while the dew is on the grass on some bright morning that promises a clear day.

When the material falls on the plant leaves it begins to be absorbed, and enters the sap of the plant and is gradually carried to all parts of the plant, even to the outermost root tip. This requires a week or even two or three weeks' time. In large vines or trees there may not be enough of this material absorbed from a single application so a second must be made, if the weather is very hot and dry or if a dashing rain falls too soon and washes the material off the plast it may be necessary to spray again.

Use Hand Gun

It is a question whether this material is best used in liquid form or as a dust. We prefer it as a liquid spray. If the user prefers the dust form, it should be used in a dust gun. Whichever way it is used, we recommend that the ordinary householder apply it with a hand-operated one-man gun. The reason for this is that if we use a power-operated machine, we are almost sure to get the material on something we do not wish to kill.

This material is death to dandelions of all kinds, but it is also death to any member of the clover group of plants. It is very effective in killing wild lettuce, and all of the rag-weeds, but it will also kill most roses and flowering shrubs if it gets on them. With a hand spray, we can stand in such a way that we miss our desirable plants while we reach the one we desire to kill.

Hay-Fever Problem

For years, the hay-fever problem has been a serious one all over the country, especially in the vicinity of great cities. It is generally recognized that this disease is generally caused by breathing the pollen of any of the rag weeds that at blooming time is always floating in the air. New York City made a very expensive experiment last year in order to demonstrate the practicability of rag-weed control on city-wide scale. A plan was drawn up by the city health department to be carried out by the Bureau of Sanitary Engineering under the inspection of a trained horticulturalist. It is estimated that there was about 100,000 acres of rag-weeds in New York City.

The campaign was carried on for about six weeks and about 3,000 acres or ragweeds were sprayed with 2, 4-D. As a result, the American Academy of Allergy reports that there was less ragweed pollen in New York City than at any time for over 10 years and as a result there was a decided reduction in the number of cases of hay-fever in New York City.

Weeds Grow Rapidly

Ragweeds are now growing rapidly and it will not be too long before they will begin blooming. But why wait for this when they can be completely killed by one good application of 2, 4-D.

The following is a very much abridged list of the plants easily killed by this material:

With a hand spray we can stand in such a way that we miss our desired plants while we reach the ones we desire to kill.

morning glories of all kinds, Queen Ann's lace, Jerusalem artichokes, wild asters, sunflowers, beggar's ticks, velvet leaf or butter print, bitterweed, Virginia creeper, all varities of cress, wild carrots, all nettles, bouncing bet, burdocks, all of the buttercups, dandelions of all kinds, dodder, goldenrod, ground ivy, henbit, wild mustards of all kinds, our common wild evergreen honeysuckles, knotweed, lambsquarter, larkspur, lettuce, Carolina moonseed, chickweed, peppergrass, plantin pokeberry, poverty weeds, all of the amaranth or pigweed roots and there seems to be plenty of evidence that it will kill wild onions. As before stated, be careful about getting it on all leaves and shrubs.

My 4-H Project

By Thelma Clay

Penny Club, Malison County

"My 4-H Club project is poultry. After I decided to take poultry as a project, I talked it over with my father. He agreed to buy me 25 baby chicks and feed for them.

"On January 9, my father helped prepare a place to put my chicks. I got them on February 14 and had my brooder all ready for them. Now I spend at least 45 minutes each day after school working with my chicks.

"This is my second year in 4-H Club work and I hope to be successful with my projects."

Cotton Chopping in Eastern Arkansas

By Ocie Lee Smith

While working with Farmers Home Administration Negro borrowers the week of June 9 in Eastern Arkansas, I took advantage of the opportunity to look into the cotton chopping situation which, of course, has created an urgent problem because of incessant rains. A description of what is taking place will give an index into the economic status and attitudes of certain elements of Negro non-farm and farm people. The following quotations were collected from transient scoppers and farmers to and from cotton fields.

Passenger aboarding bus, "I want to pay for three of us back to Wynne."

Driver of bus, "What's wrong, you 3 girls quitting?"

"Yes sir-ee we are. The sun is too hot, and furthermore that man ain't paying but $4.75 a day. Just on the other side of town you can get $6.00 a day, and ice water."

The three Negroes take seats in the rear of the bus, meet others and continue conversation.

"Whew! This air show feels good; just drive on man."

"Say", says a renter en route to Forrest City to visit wife in clinic. "I know a place where you can get $7.00 a day, and don't have to take no static, cause the man right across the road 'isbeckoning 'for you. Tell me over near Earle they have struck for higher wages cause that cotton over there is as grassy as hair on a hog's back."

Preacher en route to funeral in Marianna, "Children, I've been sitting here listening to you talk. What you say look like the "signs of the times". I remember when I chopped cotton for 50c a day, but salt meat bacon wasn't but 10c a lb. Now even at $6.00 a day, when you get through buying 'your furnish' you won't have nothing left."

In unison, "That's the truth."

One middle-aged lady chimed in, "Before I'll work for nothing, with these high prices of food, I'll go fishing every day." (Great and loud laughter in unison)

Preacher, "They had a meeting at the church in my neighborhood out from Marianna last week. A man came in to take a list of who would go out the next morning. He told us he was paying $2.50 a day. Everybody in the church laughed out loud, and one of the deacons told him, "looks like you're gonna have to plow yours up".

A fellow who had remained very quiet all the time said, "Now, I've been sitting here listening. You all let me talk. You know, looks like this cotton proposition is about to bust open. When I get through with this crop, I'm selling my mules and tools and everything else but my cows, chickens and hogs. I'm going to put this money in my pocket; I ain't for letting this crash catch me napping. Again, I just got to thinking. Here we go out there in the field with our heads bowed down working, and can't see nothing. Can't even check up to even see which way you going. Now you know it's taking just some money to pitch this crop, and if the price of cotton goes down, we are ruined. Won't be long no how before them cotton choppers and pickers gonna start us to twittling our thumbs. I've been farming 20 years and it used to be we'd know just about what to expect. Now it's just like playing checkers, if you move you lose."

Truly, I was thrown into a thought crisis. Here I sat among people who actually lived by the sweat of the brow, by tilling the soil, with acquired philoslophies, even though unpolished, attract attention and deserve consideration.

Driver, "Marianna, all passengers out for Marianna."

I baled out, confused in my thinking, I know I looked haggard. I felt empty, my vision was blurred. I was in a state of flux, quite a contrast to these tillers of the soil who alighted the bus, laughing and joking, moved onto a roadside confectionary, bought ice cream cones and began licking the melting mixture of sugar and milk.

"My, my", says I "goodness! It's hot! May I have one too, Mister."

"What flavor?"

"Strawberry, please."

Surplus Potatoes for School Lunches

Ex-GI Warfield Keene, Jr., one of several veterans who are studying to be cooks at the Margaret Murray Washington Vocational School in Washington, D. C., is shown dropping potatoes for the school lunch program into a mechanical peeler. These potatoes are part of two million surplus bushels from last year's record crop which the Government is distributing to schools throughout the country for use in their school lunch programs. The Washington Vocational School cafeteria not only serves hot nutritious lunches to its own students at noon each day, but it also serves pupils from nearby elementary schools.

2,000,000, Bushels of Surplus Potatoes Go to White and Colored School Children

Washington, D. C.

Two million bushels of surplus potatoes from last year's record crop are being passed along in extra portions to white and colored school children through the joint Federal-State School Lunch Program, reports the U. S. Department of Agriculture.

This extra outlet, though comparatively small, is serving a double-barrelled purpose, say Department officials. They point out that the larger servings of potatoes provide the youngsters with additional energy for study and play; also the purchase of these surplus potatoes by the Government protects farmers against heavy losses.

The 1946 crop totaled 475 million bushels, about 100 million bushels more than are annually consumed by the American people.

Foreign countries took some of this surplus, but not a very large part because the special handling in shipping both fresh and dehydrated potatoes makes the per-unit cost in food value too high. Even Canada, which last year took about 10,000 carloads of potatoes from this country was not in the market because of her own large crop.

The School Lunch Program, made permanent this year for the first time, has made it possible to turn over about two million bushels of the surplus potatoes to public and parochial schools throughout the country. All the States, the District of Columbia, and the territories are participating in this program, which offers their schools two types of Federal aid: (1) A cash idemnity, matched dollar for dollar by the State, of so much per meal, according to the type of lunch served, and (2) the direct distribution to them of surplus food bought by the Department of Agriculture as part of the Government's price support program.

Since Congress passed the Steagall Amendment it has been mandatory for the U. S. Department of Agriculture to support the price of potatoes. This means that the Department will have brought from 60 to 100 million bushels of the potatoes grown in 1946. The Department has made every effort to divert these potatoes into channels of human consumption.

4-H'er Wins State Prize

Fifteen-year-old Maurice Harper of Okmulgee, Oklahoma, recently was awarded a $25 saving bond for having the best record of any colored 4-H club member in the State, reports State Leader Paul Brooks of the Oklahoma State Extension Service.

Young Harper's activities included the winning of the Danford Foundation award in 1945, winning the reserve grand championship on a hog he placed in the Junior Fat Livestock Show last year, winning an award for a hybrid corn project, a prize for a calf he entered in the State Fat Livestock Show, and a blue ribbon in the appropriate dress contest last spring.

Also, this prize winning 4-H'er operates a tractor on his father's 160-acre farm, has over $250 in his savings account, is a member of the baseball and softball teams, and attends Sunday School regularly.

Iowa Children Study Lowly Mud Pies, Learn that Valuable Soil Must Be Saved

By Knox Craig

Des Moines, Ia.—(AP)—The lowly mud pie some day may take its place with the Bunsen burner and the map in Iowa's 6,000 rural schools.

Soil conservation is now an intergal part of the curriculum and in the classroom, on field trips and in special projects, a majority of the state s 48,000 rural school children are being taught, "to see that civilization moves, survives, or disappears with the fertility of the soil."

The first year of a three-year experimental proram ended with the close of school this spring and Iowa students, for the first time, from 40 questions dealing with soil conservation and related problems on their state examination papers.

There is no lack of opportunities for first to eight grade children to see in the rolling, fertile farm lands that surround their little schools some of the things they have studied in the classroom.

They study soil samples to see their various compositions. They are taken to fields where erosion has slashed deep ditches or where water stands in fields not properly drained. They may observe a pasture which overgrazed and filled with weeds.

Study the Land

The children are encouraged to question their parents and other farmers in the area about the history of their lands. In some classes pupils are asked to draw maps of the farms on which they live showing the running streams, dry creeks, gullies and ridges. They are asked to report on the conservation practices on their farms.

Studies of wildlife, an important part of the course, help hold their interests. The Iowa state conservation commission works closely with the schools, and runs in its monthlc publication stories of some phase of wild life included in their studies.

As part of the program hundreds of students prepare scrapbooks or write essays on soil conservation subjects. In a numer of counties the soil conservation commission or the Izaak Walton League sponsors such contests and offer prizes. Hand-painted pictures of game birds went to the winners of a Marshall County contest.

'As the Soil is Lost'...

How important the soil is to U. S. livelihood constantly is emphasized in these essays by school children. Shirley Livingston, winner of a for-county contest in northeast Iowa, writes, "as the soil is lost, so is our security and our freedom."

Mary Gardner, 12-year-old eighth grader, who won the Marshall County contest, observes that "the soil is a nation's most valuable natural heritage" and concludes that the remedy for soil erosion "lies in education."

The comprehensive three year study, which is a part of the regular science course, includes units on soils and how they deteriorate, the agencies employed in soil conservation and methods used, wild life, conservation of minerals and for ests.

How deterioration of the soil has a direct bearing on the welfare of the child is stressed early in the training course. The teaching out line suggests that teachers have their classes make lists of things which the pupils or their parents need in the home or on the farm.

Then they are shown how not only the money to buy such things but also the basic products from which they are made come from the soil The children, for example, are asked to list many of the materials which are used in an automobile such as steel, rubber, wood and glass, and then shown how productive soil is needed for building the automobile.

WOMAN'S PAGE

In the Good Old Summertime Try These

Summertime, when the afternoons are longer and we are inspired to stray out in the open as much as possible, should be a happy time. It is a good idea to store up as much sunshine as we can during these months to fortify us through the dreary months of fall and winter. For those whose only vacation is to be at home it is well to take it easy when it comes to preparation of meals and try to salvage added time for work or recreation outdoors.

This does not mean that one must sacrifice nutritional values. We can economize upon, our time, and upon our expenditure of money, for simple foods, well prepared and with taste appeal, are often relished more than fancier dishes which require more tedious preparation.

There is no better way to gain this freedom for outdoors than to let your supper feature a generous platter of meat patties or hamburgers, dressed with onion rings and accompanied by a zesty sauce and pickles. Serve with this a bowl of assorted spiced pickled fruits and one hot dish. That hot dish might be buttered corn, garden peas or baked squash. Sliced tomatoes, coffee or tea and a light dessert will make it a perfect meal to end a summer's day.

The meal which we have outlined today is a simple one, consisting of hamburgers, served with mustard and catsup and onion rings, jars of hot sauce for those who want their hamburgers even hotter, buns, stewed fruits and watermelon. The fruit can be prepared hours ahead of time, the watermelon is kept chilled, the buns can be purchased or made at home and reheated at the last minute, and about the only last-minute kitchen work involved is the actual cooking of the meat.

Such a meal can easily be whisked to the porch or to the back yard for easy serving in the cool of the evening

For quick and easy meals your broiler is an indispensible help. The tender cuts of meats are suitable for broiling, but in many instances they are expensive, and when chops and steaks are too high the standby for the home-maker is ground meat.

Ground meat, cooked or uncooked, may be used in various ways for delicious meat dishes. It may be served in patties or croquets, in loaves, or creamed and served on toast or in combination with other foods.

If your family is beef hungry and your budget is running low, how about serving beef patties? Of course you do not want to serve them the same way each time. If you want to stretch the meat a bit here is a suggestion developed in wartime which is good enough to retain in one's files, making patties which you can count upon to serve six people.

Victory Meat Balls

1 lb. ground beef
1 1-2 cups rolled oats
1 medium onion
1 1-2 tbsp salt
1-8 tsp. pepper
2 cups tomatoes
Drippings for browning

These may be shaped in flat patties or rolled into balls as you like, after they have been mixed by combining the ground beef, rolled oats, onion and seasoning with one cup of the tomatoes. Shape, roll in a little flour and brown in hot drippings. Cover this with the remaining tomatoes and simmer gently about 45 minutes. Serve with onion rings and the sauce left in the skillet

Here is another combination which stretches meat and serves equally well for patties or a larger meat loaf.

Meat Loaf or Patties

2 pounds ground beef
1-2 pound chopped bologna
1 cup bread or cracker crumbs
1 cup chili sauce
1 tsbp. grated onion
2 eggs, beaten slightly
2 tsp. salt
1-8 tsp pepper
Few thin slices American cheese

Put the ground beef and bologna through the meat grinder together, or chop the bologna with a sharp knife and mix the two meats together thoroughly. If you have any stale bread, but into tiny cubes and let them stand in the chili sauce a few minutes, to moisten them a bit. Combine all the ingredients except the cheese, and mix well. Pack into a loaf pan or shape the mixture into individual cakes. Lay the slices of cheese on top and bake in a slow oven (300 degrees F.) for about one to one and one-half hours This recipe will serve 8 or 10 people

This dish, with its bologna and chili sauce blended with the other ingredients, is unusual and spicy, and it is equally good when the loaf is served in cold slices

Lamb has been unusually good this year, and we all enjoy a lamb roast A roast is a good investment, for there are many ways of using the leftover portions. One of my friends uses ground lamb or beef thriftily and attractively in a dish she calls Green Pepper Ring Loaf. The recipe calls for shoulder breast or shank of the lamb. (Cooked lamb may be replaced successfully by veal or beef.)

Green Pepper Ring Lamb Loaf

1 1-2 pounds ground lamb
1 1-2 cups bread crumbs
1 cup milk
3 tbsp grated onion
1 cup cooked peas
1 1-2 tsps. salt
1-8 tsp. pepper
2 tbsp. chopped parsley
1 small bay leaf
3-4 cup cooked seasoned rice
1 egg
4 small green peppers

Buy lamb from the shoulder, breast or shank for grinding. Soak bread crumbs in milk. Add onion, peas, salt, pepper, chopped parsley and finely crumbled bay leaf. Mix thoroughly. In a separate bowl, combine the cooked rice and eggs. Remove seeds and membranes from peppers. Parboil pepper cases about five minutes or until tender. Drain, rinse with cold water and fill with rice mixture. Line the bottom of a loaf pan with waxed paper Pack a one-fourth inch layer of meat mixture into loaf pan. Arrange stuffed peppers on meat and pack remaining meat around peppers to make a firm loaf. Bake in a moderate oven (350 degrees F.) for one and one-half hours.

Liver Loaf

1 1-2 pounds liver
2 slices bacon
1 medium onion
2 eggs
1 tsp. salt
1-8 tsp. pepper
1-2 tsp. marjoram
1 cup cracker crumbs
1 1-2 cups liquid
1-2 cup catsup

Cook liver slowly for five minutes in water to cover. Reserve liquid. Put liver through food chopper with bacon and onion. Add all other ingredients except the catsup. Liquid in which the liver was cooked, meat stock, milk, tomato or other vegetable juice thoroughly. Pour the catsup into a well-greased loaf pan. Pack meat mixture over catsup. Bake in a moderate oven (350 degrees F.) for one hour.

Fruits are an especial boon to the home-maker in hot weather when light salads and desserts are desired. Fruit is the answer for that little extra something necessary to round out a meal. Spiced pickled fruits, fresh or chosen from your own canning or tins purchased at the store, add charm and give dash to the plainest menu.

Fruit Compote

6 peaches
1 can apricots
1 lemon, sliced
2 cups fruit juice (including apricot)
1 orange, sliced
1 1-2 cups sugar
3 bananas

Peel and quarter peaches. Make a syrup of sugar, fruit juices, sliced oranges and lemons. Add other fruits. Simmer 10 minutes Serve warm or chilled, garnished with sprigs of mint.

Another fruit compote recipe uses apples instead of peaches and requires no orange.

Fruit Compote No. 2

6 apples
1 small can apricots
2 cups water or apricot juice
1 lemon
2 cups sugar
1-2 lemon

Peel, core and quarter apples. Make syrup of water or juice and sugar, add lemon and apples, stew until tender, add apricots and bananas sliced. Cook 10 minutes. Pour in dish. Serve hot or cold with or without cream. Nuts may be added to this at the same time that apricots and bananas are added.

MASHED POTATOES WITH SPRING ONIONS

While potatoes are cooking wash one bunch of spring onions and cut into thin slices. Panfry in two tablespoons of butter or margarine. Pour over mashed potatoes in serving dish.

Creole Pot Roast

4-lb. chuck pot roast, bladestone or armbone
1-4 cup thinly sliced stuffed olives
1 medium onion
1-4 cup olive liquid
1-4 cup water
1 cup condensed tomato soup
Flour, fat, salt, pepper

Dredge roast with flour and brown slowly in several tablespoons melted fat. When browned, sprinkle each side with salt and pepper. Mix olive liquid, water and tomato soup together. Pour one-half cup of this over and around the meat. Sprinkle sliced olives and chopped onion over and around the roast. Cover roaster and place in a 325 degree F. oven. Cook for two and one-half to three hours, or until meat is tender. Or cook roast in Dutch oven on top of the stove at simmering temperature for the same length of time. As the liquid cooks away, (after about the first hour), add rest of liquid. Thicken gravy with flour, adding more water to make of resired consistency. Serve over rice or noodles. (Potatoes are not suitable for this type of gravy.)

Steamed Rice

1 cup rice
2 cups cold water
1tsp. salt
1 tsp butter

Wash rice thoroughly. Place in saucepan and add water, salt and butter. Cover. Cook on high heat until steaming (eight to 10 minutes). As soon as rice is steaming, stir with a fork, cover and turn to low heat. Steam without removing cover for 20 or 25 minutes.

If any of the Creole sauce is left from the pot roast, a delicious dish may be made by folding it into left-over rice. Top this with grated cheese and bake 15 to 20 minutes.

Peach Salad

1 can peach halves
2 cups cottage cheese
1 3-oz package cream cheese
4 tbsp. crushed pineapple
Almonds and cherries
Mayonnaise

Mash cottage cheese through a sieve. Mix thoroughly with cream cheese, pineapple, mayonnaise and seasoning of salt, red pepper and a drop or two of Worcestershire. Chill Fill peach cavity with mixture. Garnish with lightly toasted almonds and maraschino cherries or strawberries. Serve with whipped cream and mayonnaise on bed of lettuce.

Water Cups

3 tbsp. butter
6 tbsp. confectioners sugar
2-3 cup flour
Few grains salt
3 tbsp. milk
1-2 tsp. vanilla
Fresh fruit

Cream the butter, add the sugar gradually and cream thoroughly. Mix the flour and salt and add to the first mixture alternately with the milk. Add the vanilla. Drop by spoonfuls, several inches apart, on buttered cooky sheets and spread very thin, making eight rounds about five inches in diameter. Bake in a moderate oven (325 degrees F.) for 12 to 15 minutes or until very delicately browned. Place the pans in the oven a few minutes apart so that they will not be done at the same time. Remove the rounds, one at a time, with a wide spatula and shape over an inverted glass or custard cup. Cover with a cloth before shaping to keep from burning the hands. Work quickly, because the cups must be shaped while warm. If they become too crisp, return to the oven to soften. Fill carefully with fruit. These cups are fragile but delicious. This recipe makes eight.

A delightful way to use any meat left from roast is chartreuse of meat and rice. From our main meal today, you will perhaps have some rice left.

Chartreuse of Meat and Rice

2 cups cooked meat
1 tsp. salt
1-2 tsp. pepper
1-4 tsp. onion juice
1 tbsp. parsley
1 egg
3-4 cup soft bread crumbs
4 cups cooked rice

Season meat and mix with crumbs and beaten egg, add enough stock to make it pack easily. Line a thoroughly buttered mold with three cups of rice, fill with meat mixture and cover with remainder of the rice. Cover tightly and bake. (Half of this recipe may be successfully made.)

No better tasting leftover pot roast dish is there than croquettes. The croquettes given below are seasoned tastily with catsup and Worcestershire sauce and have the interesting addition of a few shredded raw carrots. They're fat savers, too, because they're baked in the oven instead of deep fat fried.

Beef Croquettes

2 cups ground cooked meat
3-4 cup thick white sauce
1-4 cup shredded raw carrots
1 tbsp. finely chopped onion
1 tbsp. catsup
1 1-2 Worcestershire sauce
1 tsp. salt
Dash of pepper
Milk
Fine bread crumbs

(Make thick white sauce using three tablespoons flour, one tablespoon, fat, and three--fourth cup milk. Do not season.) Combine meat, white sauce, carrots and seasonings. Chili mixture for several hours. Then shape in cylinders about three inches long and one and one-fourth inches thick. Dip these in milk then roll in fine bread crumbs. Place in a shallow baking dish and drip melted margarine or butter, or a mixture of the two, over the croquettes. Bake in a 400 degree F. oven for 20 to 25 minutes. Serve alone or with tomato or mushroom sauce.

Either a cherry pie or a gooseberry pie would make as good a dessert as the cherry-filled wafer cups.

Cherry Pie

1 qt. cherries
1 1-2 cups sugar
3 tablespoons butter

Cover cherries with water after they are stoned; add sugar. Cook until tender. Line pan with pastry; strain cherries and fill pastry; sprinkle with a little sugar, add butter in small pieces and a few tablespoons cherry juice. Strip with pastry. Bake in 375-degree oven about 35 to 40 minutes. This acn be baked in individual pans if desired.

Gooseberry Pie

1 qt. gooseberries
2 cups sugar
2 tablespoons water

Pick, stem and wash berries. Add water and stew until tender. Add sugar. Boil one minute. Line pan with pastry and fill with berries; sprinkle with sugar, bits of butter. Cover with pastry and bake until pastry is brown. Serve with cream

Treasured Recipes From the Old South

By Lillian Potter Barrett

EGGS

The egg was not new to us—even before we had heard so much in recent months about Betty McDonald's book, "The Egg and I." It is an international must, and a breakfast favorite in many delicious dishes. Furthermore, one should eat eggs, unless allergic to them, at least every other day. Here are some recipes you can try.

Deviled Egg Casserole.—Boil four or six eggs hard, then remove shells and cut eggs lengthwise. Remove yolks and mash well. Saute three-fourths cups mushrooms in butter along with two teaspoons parsley and add to mashed yolks, add two tablespoons chili sauce, one-fourth teaspoon salt. Fill egg whites with yolk mixture and set in greased baking dish. Pour over them one can of tomatoes or tomato sauce and sprinkle heavily with grated cheese and then bake in a hot oven (about 425) for fifteen minutes. Makes four good servings.

Watercress and Egg Salad.—Wash and remove stems from two bunches water-cress, and combine in salad bowl with two-thirds cup slivered carrots, one-third cup scallions, four hard-cooked eggs quartered, one-fourth teaspoon salt, about one-half cup French dressing, and four radishes thinly sliced. Serves four.

Super Scrambled Eggs.—Fry 3 slices af bacon crisp and drain. Blend one tabespoon bacon fat with one tablespoon enriched flour, three-fourths teaspoon salt, and pepper to taste in the top of double boiler. Stir in four beaten eggs and one cup milk and mix thoroughly. Add the three slices of bacon chopped and cook without stirring. Now and then run a spatula around the edge, lifting to let uncooked portion flow underneath, but avoid a stirring motion. Serves four.

Egg and Bacon Souffle.—Requires one-fourth cup diced bacon, three slices of bread, three slightly beaten eggs, one cup milk one-half teaspoon salt, one-fourth teaspoon dry mustard, and one-fourth teaspoonful paprika.

Fry bacon crisp. Brush bread with bacon fat and cut slices of bread to fit deep casserole. Arrange in layers. Sprinkle each with bacon. Combine eggs, milk and seasoning and pour over bread. Bake in a moderate oven (around 350 degrees F.) until puffy and mixture does not stick to inserted knife.

Serves four.

Morgan Women Grow Chickens

Commercially hatched chicks and lamb brooders have given start in poultry production this year.

Their goal is to increase production for home use and for market. A record number of chicks have already been bought from nearby hatcheries and strict rules of feeding and sanitation are being followed.

Mrs. Sallie Bibb of Hartselle Community started 150 chicks on March 4 from which she plans to save the pullets and sell the cockrels.

THE GODLY FACES THE PROBLEM OF SECRET DESTORYERS

Another of the great qualities of Gopher was its ability to resist destruction by termites. Such destruction can be well understood by persons who have lived in forestry districts. They have noticed wood cutting insects which bore into logs and boards causing them to lose their strength and usefulness. Workers in the church of God would suffer similar tragedies were it not for the fact that the spirit of God fixes a man so that the boring insects of sin will not oe able to destroy them. What are some of those insects of sin? One may ask. They are things which are unseen but are quietly working destruction to the individual. One of the sinful termites is the tendency to cease work or slow down on work in the church because someone else thought to be a true Christian is found to be a hypocrite. Discoveries of insincerity and falsity in persons of whom one has held high estimation often shocks one into a temptation to stop. The person who is not thoroughly rooted in Christ will stop, but when a person having been born of God has studied to prove himself a faithful worker for Christ, as advised by Paul to Timothy, that person with his preparation will resist the boring of the termite of disappointment.

Another of the boring sinful termites is selfish over-estimation. Many people are hindered in their efforts mainly because they think more highly of themselves than they should. The person who places himself high in his own mind is more concerned about what the people are thinking and saying about him than he is about doing a great job for the Lord. While one is seeking honor and recognition for himself, he cannot give due honor and recognition to others or to God. Neither can he put his whole soul and body into his work because his mind is not on the things of God. The church has been exploited by many persons who were seeking honors and favors from others. They came into the church not to honor, but to be honored; not to serve but to be served; not to praise, but to be praised not to lead men to Christ, but to lead them to themselves. These persons are made weak and useless for service in the kingdom of God. The Christian however, is treated with the spirit of God which never allows his head to get too big, or his thoughts of himself to run too high. The truly converted man often refers to himself as the unworthy servant and as the least of all.

Another dangerous termite of sin is that of underestimating one's own ability and relationship with God. Many persons in the church of God are not rendering service today because they feel that they are not able to render the type of service which is expected. Such a person does not realize that the least that one does for God is precious enough in His sigh for God to send special blessings and rewards of joy. Many men may have the same tolent. but all do not have it to the same degree, and all should realize that God needs the talent of each to his respective

Carver Peanut Research May Be Expanded By U. S. Dept. of Agriculture

Washington. D. C.—Some of the peanut research studies begun by the late Dr. George Washington Carver may be furthered by the U. S. Department of Agriculture under the Research and Marketing Act of 1946, if the recommendations of the Peanut Advisory Committee are carried out.

In its recent report to A. E. Meyer, administrator of the Research and Marketing Act, the committee recommended that four types of peanut research be conducted. Among these, it proposed that a high priority be given research on consumption of peanuts for edible purposes and on the development of new ways of incorporating peanuts into other foods such as soups, meat substitutes, infant foods, and other specialty products.

Dr. Carver did considerable research on this problem. In 1916, he published a bulletin entitled "How to Grow the Peanut and 105 Ways of Preparing It for Human Consumption." In this publication he has prepared recipes for such items as peanut ice cream, peanut sausage, baked peanuts with rice, peanut pudding, and peanut soup.

Other peanut research projects recommended by the committee are: Seed improvement and maintenance of seed stocks; mechanization of

West Virginia 4-H'ers Publish Song Booklet

Colored 4-H Club boys and girls of West Virginia now have a new mimeographed booklet of 4-H songs which State Leader L. A. Toney is distributing to farming areas throughout the State.

The song booklet was compiled by Mrs. Susie J. Price, club agent. It contains neraly 50 songs. It opens with the 4.H pledge: "I pledge my head to clearer thinking, my heart to greater loyalty, my hands to larger service, and my health to better living for my club, my community and my country."

The booklet of songs closes with "A Plowing Song." The last lines of this song are as follows: "Sons of the soil are we, lads of the field and flock turning out sod—asking no odds where life is so free.

"Sons of the soil are we—men of the coming years facing the dawn—brain ruling brawn; lords of our land we'll be."

Seeks New Uses for Farm Products

JOHN E. HODGE, research chemist on the staff of the U. S. Department of Agriculture's Northern Regional Research Laboratory which is seeking new industrial uses for agricultural products. The laboratory is situated in Peoria, Ill., where the young chemist is engaged in starch research.

Specialist Says Mechanization Will Replace Many Farmer Tenants

Washington, D. C.—As cotton production becomes mechanized, hired workers will replace tenants and sharecroppers, says O. B. Brown, Arkansas Extension farm management specialist, in a report received this week by the U. S. Department of Agriculture.

The specialists draws his conclusions from the 1945 census which shows that only 43 percent of Arkansas farms are operated by tenants and croppers. This com-

Virginia Extension Agents Conduct 873 Farm Demonstrations

Washington, D. C.—A total of 873 result demonstrations are being conducted with colored farmers in Virginia by that State's 29 Negro agricultural extension agents, reports Ross W. Newsome, State extension agent.

Result demonstrations which are carried out by farmers under the guidance of extension agents serve to help show locally the value of following recommended farm practices. Field meetings are held in connection with the demonstrations so that farmers throughout the community may witness the results.

(Continued On Page 4 Col. 4)

Prof. John E. Hodge Graduate of University of Kansas Valued Highly

Washington, D. C. — John E. Hodge, research chemist, is making a significant contribution to the intensive search for new industrial uses for farm products which is being carried out at the U. S. Department of Agriculture's Northern Regional Research Laboratory, Peoria, Ill., says Dr. L. B. Howard, chief of the Bureau of Agricultural and Industrial Chemistry.

Mr. Hodge, who has been employed in the laboratory since 1941, is engaged in starch research which may lead to the development of more durable lacquers and varnishes, synthetic fibers, and products similar to cellophane.

C. E. Rist, acting head of the Starch and Dextrose division of the BAIC laboratory, reports that Mr. Hodge has made major contributions to the knowledge of the preparation of complex starch derivatives. He points out that the young chemist has developed an improved procedure for preparing these derivatives which has enabled him to succeed in solving the difficult problems of separating the constituents of trimethyl starch—something that had never been achieved before. The results of this research will be published in scientific journals.

Mr. Rist explains that a thorough knowledge of the chemical structure of starch, such as Mr. Hodge's work has made available, is necessary in order to determine the industrial uses that may be made of it. He says that the new lacquers and varnishes that may probably be developed from starch offer the possibility of increasing considerably the life of furniture coated with them.

Mr. Hodge, who is considered one of the most valuable research chemists in his division, received his A. B. and his M. S. degree in chemistry from the University of Kansas.

Plan $75,000 4-H Camp For South Carolina Negro Farm Youths

Washington, D. C., April 28, 1947—Plans are underway for the construction of a $75,000 4-H camp for colored farm youths of South Carolina, report E. N. Williams, and Mrs. Marian B. Paul, supervisors of Negro Extension work in the State.

The camp, which is to be named in memory of Harry Daniels, late Extension supervisor who served the State for more than 25 years, will be situated on a 267-acre site spreading along Lake Marion near Orangeburg. The site has already been purchased for $2,100 with funds raised by the colored farm and home demonstration agents of the State

Altogether, the agents have raised nearly $8,000, and they have asked the South Carolina State Planning Board for $56,000 to construct two dormitories, a recreation hall, a workshop, and a model farm home.

Camp plans also call for the establishment of a small model farm, and the seeding of 10,000 pines for naval stores and timber, and 200 pecan trees. The agents expect to collect enough from the sale of naval stores, timber, pulpwood, pecans, and other farm products to take care of a large part of the operating expenses of the camp.

With the construction of Camp Harry Daniels, which is expected to get under way next year, there will be a total of four state camps and 303 county camps for colored 4-H'ers. The other State camps are situated in West Virginia, Georgia, and Louisiana.

Important Recent Achievements of Department of Agriculture Scientists

Soluble Sausage Casings from Fruit Wastes: A new pectinate material, made from citrus peel or apple pomace and used as a soluble protective covering for sausage and other meat products, was recently developed by the Bureau of Agricultural and Industrial Chemistry's Western Regional Research Laboratory at Albany, Calif. The method for making this new coating material is simple and easily controlled. A 2 percent dispersion of low-methoxyl pectin is prepared and adjusted to a suitable acidity. A calcium salt is added in a quantity so a calcium pectinate soluiton will form at about 150 degrees and the material will gel when cooled to 104 degrees. The sausage or other meat product, molded into any desired shape, is dipped in the warm solution for abolt 3 seconds, after which the liquid coating is dried in a current of air for half an hour to form a strong gelled film coating. Treated products can then be stored in the usual way. If the coated meat product is boiled, the film will dissolve; if fried or roasted, the film, which is tender and edible, may be eaten with the meat.

Ham and Eggs Get Scientific O. K.: Confirming practical experience, sicentists in the Bureau of Animal Industry have shown why ham and eggs are an efficient, satisfying food combination. One reason is because the proteins of those foods supplement each other so well that the two, when eaten together, supply more nourishment than when eaten separately. That, in substance is the result of a series of tests on rats involving these and other protein foods. Provious experiments had shown that the protein in pork enhanced the value of bread eaten with it. Now it appears that the protein of egg enhances the value of the protein in pork when ham and eggs, for instance, are eaten together. The whole is therefore greater than the sum of its constituent parts! Although the protein in dry-cured ham was inferior to that of spray-dried eggs in growth-promoting value, when the diet contained equal parts of ham and egg protein the growth-promoting value was practically the same as for eggs alone. When the diet contained two parts of ham and one part of egg, the growth promoting value was somewhat higher than the computed value, but lower than the value of eggs alone. The addition of the sulfur-containing amino acids, crystine and methionine, also proved advantageous in promoting growth. The general results of the tests provide further evidence of the superiority of carefully selected combination of foods and food supplements over the same products eaten separately.

Ethyl Alcohol from Whey: Successful alcoholic fermentation of the lactose, or milk sugar, in whey has been perfected by the scientists of the Bureau of Dairy Industry. Whey, a by-product of cheese and casein manufacturing plants, is one of the cheapest sources of fermentable sugar when normal whey supplies are available. Furthermore, the disposal of waste whey offers difficulties in steam pollution. Before the war the Bureau scientists demonstrated that alcohol could be produced from whey. Subsequently search was made for yeast strains that would perform the fermentation process more efficiently, and, as a result, a large and varied collection of lactose-fermenting yeasts was assembled and tested. One of the yeasts, known as **Torula cremoris**, did a complete job of fermentation in 55 hours, proving far superior to any competitor among the yeasts under observation. It was finally selected for pilot-plant trials by Bureau workers. Experimental yields of ethyl alcohol averaged 84 percent in the plant, as compared with nearly 91 percent in the laboratory. The best temperature for fermentation is around 33 degrees to 34 degrees and for best results the whey is slightly acidified before fermentation. Yeast equal to only about 2 percent of the weight of the lactose is required. The equipment required is relatively inexpensive. The alcohol can be made as a by-product of cheese or casein manufacture, using waste steam to concentrate the alcohol. The whey protein and slops remaining make an exeellent by-product feed for cattle. Thus a former waste product, which was hard to dispose of, may become an asset and a valuable source of useful products.

Fight Oats Disease: There is a rust hole in the armor of Clinton oats, a new variety distributed in 1944 by the Department of Agriculture and the Iowa, Illinois, and Indiana Experiment Stations. The hole is the result of a fungus, a specific race of crown or leaf rust. Among scores of races of leaf—and stem-searing fungi and other diseases that attack the oats crop, it is the most dangerous enemy that threatens this high-yielding upstanding variety. This flaw in Clinton illustrates the unending struggle of lant breeders to build genetic bulwarks against the shifting tides of disease. Clinton's present difficulty is a striking example of the ups and downs that result from improvements by the geneticists on the one hand and the chance development of new races of destructive fungi on the other.

Today oats are attacked by literally scorcs of races of rusts, smuts, and other diseases. There are now at least 75 races of oat rusts some attacking leaves, some stems. The peculiar qualities necessary to pierce Clinton's armor are in Race No. 45 and several other minor races of the leaf rusts of oats. At present the loss because of Race 45 is not likely to be important as it is minor, and some less well-known oat varities are resistant to it. But Clinton oats has been going places and in a few years, in the absence of a better variety, it will be grown on large acreages in the North Central States. This would mean easy picking for a pushing pest just starting out. It could spread like the proverbial "wildfire" if elimatic conditions were favorable. So the oats breeders are already working to develop a new variety with the high yield and the many disease-resistance factors of Clinton and, in addition, resistance to leaf rust Race No. 45.

Women Buyers' Preference in Textiles: The preference of women buyers among certain ready-made textile yard goods is the subject of a survey conducted by the Bureau of Agricultural Economics. The survey shows, for instance, that 59 percent of the women buy ready-made house dresses and that the rest make their own, wear old street dresses, or use slacks. Other questions taken up in the survey: What fibers do women prefer? What qualities in ready-made items do they consider important? What do women say are the good and bad points of cotton and rayon in fabrics or articles in which these fibers compete?

Progress in Vanilla Research: The Department of Agriculture Experiment Station in Puerto Rico has conducted experiments with vanilla since 1907, when cuttings were introduced from the Florida Experiment Station. The commercial industry began to grow about 1917, when a root rot appeared which has limited production and expansion of the vanilla industry to date. In 1927 a member of this station identified the causal organism as a fusarium root rot. In cooperation with the P. R. Insular Government, investigations since that time have been devoted largely to crossbreeding for varietal resistance and to study of the cultural practices which support vigorous healthy growth. A system of growing vanilla, using lath shade admitting about 50 percent sunlight, has been devised and shows considerable commercial promise. The first year's flowering and fruiting has exceeded all expectations. One commercial grower has entered into a long-term experiment with the station, testing the method on a commercial scalc. Widespread interest has resulted and the experiment is being watched by vanilla growers as the hope for the future of this new industry.

Wartime Revolution in Farming: Agricultural production increased twice as much between 1939 and 1944 as it did in the preceding 20 years. Even though one-fourth of the production in 1944 and 1945 went to military and other war emergency uses, there was enough food to provide civilians with a per eapita food consumption 10 pereent higher than in 1935-39. The story behind these revolutionary developments was told in Changes in Farming in War and Peace, by Sherman E. Johnson, of the Bureau of Agricultural Economics. Although unusually favorable weather contributed to increased farm production during the war, technological developments were more important. These included mechanization, increased lime and fertilizer, cover crops, and other conservation practices, improved varieties of plants, better balanced feeding of livestock, and more effective control of insects and disease. These developments were not all made during the war. Foundations for many of them had been laid years before, but drought and depression prevented their application. War provided the patriotic and financial incentives that made record production possible.

Studies with Radioactive Phosphorus: By use of radioactive phos phorus in fertilizer on test crops of ryegrass, soil scientists of the Bureau of Plant Industry, Soils, and Agricultural Engineering have shown that crops on various soil types may use very differently the phosphorus added in fertilizer. On some the plants use much more of the phosphorus already in the soil. Radioactive phosphorus (obtained from one of the atomic energy establishments), when it gets into plants, can be measured with an instrument known as a Geiger counter. The scientists measured the amounts of the radioactive phosphorus taken into the ryegrass in the various test pots.

The tests showed these striking differences in the use made of the phosphorus added and of that already in the soil. In a sandy loam soil (Evesboro) from the Plant Industry Station at Beltsville, Md., which contained little native phosphorus, the grass got 80 percent of what it used from the applied superphosphate and only 20 percent from that stored in the soil. In a heavy clay loan (Davidson) from Orange County, Va., typical of the general farming soils of the Southeast, the grass got 60 percent from the fertilizer added and 40 percent from the soil. In a slit loam (Caribou) from Aroostook County, Me., heavy with native phosphorus partly accumulated from years of fertilizing, the test grass got only 12 percent of its phosphorus from the fertilizer added and 88 percent from the soil.

Researchers of the Burcau and the North Carolina Experiment Station are now conducting tests on a field scale on corn, cotton, and tobacco farms. Through radioactive materials, they hope to find facts resulting in better use of fertilizer, lime, and organic matter and better profits for farmers.

Progress of Farm Mechanization: Technological devclopments have had a rofound effect on American agriculture in the last 100 years. One farm worker in 1945 produced enough agricultural products to support himself and 13 1-2 other persons. In 1920 one farm worker supported himself and 9 others and in 1820 himself and about 3 others. Each man-hour of farm labor meant 44 percent more gross production in 1945 than in 1917-21. About half the savings in hours per unit of production resulted from mechanization. These and many other developments in the last century due to mechanization are the subject of a publication of the Bureau of Agricultural Economics, now in preparation. Emphasis is given to the effect of the developments in the last 25 years on the volume of food production, labor requirements, farm employment, and efficiency in production.

Costs and Benefits of Soil Conservation: It is becoming clearer every year that soil conservation farming pays better if it goes all the way. A 7-year study by the Soil Conservation Service of the records of 48 farms in Illinois shows a markedly higher net income for farms with high conservation scores over farms with low conservation scores. At the start of the period, in 1939, the two groups of farms were almost identical in productivity and earnings. Crop yield indexes were 100.2 for the high eonservation farms and 99.7 for the low conservation farms. Net incomes per acre were $9.87 and 9.84 respectively.

Twenty-four of the farms adopted conservation programs during the 7 years. Land use remained about the same, but the farms with high conservation scores put in more legume pasture and incorporated needed soil conservation practices into cropping and cultivation systems. Crop yields, as measured by the crop yield index, averaged 6 points higher on these farms throughout the study. Livestock production also averaged higher on these farms. Over this 7-year period the farms with high conservation scores had an average gross income per acre of $4.72 more than the farms with low conservation scores. Conservation expenses averaged 4.9 percent of the gross income on the farms with high conservation and 3.4 percent on the farms with low conservation scores.

Net farm income per acre averaged $13.88 for the high conservation farms and $9.56 for the low conservation farms. This is an annual difference of $4.32 per acre in net income, and a total difference for the 7-year period of $30.24 per acre in favor of the farms with scientifically planned conservation programs. For a farm of 200 acres, that would be an added net income of $6.048 while the farmer was putting the conservation plan on his land.

Conservative Grazing: Recent studies by the Forest Service at several western experiment stations have shown that conservative stocking increases beef production and maintains the range in better condition than heavy stocking.

In grazing studies conducted cooperatively with the Soil Conservation Service at the Central Plains Experiment Range near Nunn, Colo., yearling cattle on conservatively stocked range, 40 head per section, gained 251 pounds per head during a 6 month summer season. Estimated net returns averaged $993 per section of land. Similar cattle on heavily stocked range, 60 head per section, gained only 211 pounds per head and returning per section were $847.

On mountain summer range at ES's Manitow Experimental Range in Colorado, conservative stocking, which removed about 35 percent of all the herbage annually, produced 547 pounds of green forage per acre, while heavily stocked range—comparable at the beginning of the experiment—produced only 236 pounds.

Studies at the U. S. Range Livestock Experiment Station Miles City, Mont., in cooperation with the Buraeu of Animal Industry and Montana Experiment Station showed that Hereford breeding cows on conservatively stocked northern plains range produced 6 percent larger calf crops, and the calves averaged 28 pounds per head larger at weaning time, over a 12-year period, than similar cows on heavily stocked range. These differences in calf crop and weaning weight amounted to 45 pounds greater calf production per cow annually from conservative stocking. Costs of forage and supplemental feed averaged $1.50 higher per cow year with heavy stocking. In addition, cows from conservatively stocked range, sold at the end of breeding, brought over $12.00 per head more than cows from heavily grazed range. Conservative stocking maintained the vigor, density, and forage production of range plants, and heavy grazing caused them to deteriorate. Likewise, during recent years conservative stocking on the Jornada Experimental Range, in New Mexico, has increased calf crops from 74 to 83.5 percent and reduced losses from 2 to 1.2 percent. In addition the range has increased in grazing capacity about 20 percent under conservative stocking.

Inventor Perfects Fiber-Measuring Devices: Seven devices for determining the fineness, shape, length, surface structure, and other characteristics of fibers have been developed by Dr. John I. Hardy, research scientist of the Bureau of Animal Industry, and are adapted to a wide range of agricultural and industrial uses. Knowledge obtained with the various instruments is valuable in the breeding of improved plants and animals. It is useful, too, in the textile industry, cleaning and dyeing operations, manufacture of felt, and even in identifieation of criminals from telltale bits of elothing, hair, or other fibrous material. Most devices were used first in the study of wool in conneetion with livestock researeh. But they soon proved valuable, also, in industries working with mohair, cotton, fur, bristles, paper, leather, cork, silk, and other fibers. One is a holder for determining the fineness of wool fibers. It has a small slot of known size in which fibers are packed to a desired depth and pressed down uniformly by small weights. Excess fibers are cut away by a razor blade, which is part of the device, and the fibers remaining in the slot are counted. The fewer the fibers the coarser they are, and vice verse. The other inventions are equally practical.

Loss of Plant Nutrients by Erosion: Analysis of soils washed from slopes by rains shows that a farmer is not always feeding his own crops when he applies commercial fertilizers to his fields. If he doesn't protect his sloping land against erosion, he is likely to find he is losing his plant nutrients to his neighbor lower down the watershed.

Soil Conservation Service scientists have reported a study of erosion debris made in New York State, to determine the soil and fertilizer elements lost through runoff erosion. Samples of washed soil were taken, immediately after rain, from the bottoms of the slopes of a small watershed where it had washed from 7 farms into and along the creek, along fence rows in bottomlands, and other low places. At the same time, other plow-depth samples were obtained from the soil left on the slopes. Careful analyses showed that all transported soil contained more organic matter than the corresponding soil left on the slope. The average for the 8 deposited soils was 3.7 percent, compared to 2.9 percent for the soil on the slopes.

Seven samples of moved soil contained more potassium than the slope samples, and one contained the same amount. Five samples of deposited material contained more phosphorus than the slope samples, two the same amount, and only one less. Appreciable amounts of magnesium, calcium, and ammonia and nitrate also were found in the deposited soils. Information of this kind, when given to slope farmers, does much to encourage the adoption of conservation practices especially designed to prevent erosion from sloping fields or to build up soil organic matter in fields that have suffered this damage.

Farm Operators' Living Conditions Improve: Between 1940 and 1945, the average net income of U. S. farm operators increased substantially. During the same period, their average level of living increased one-fourth. This is shown by indexes, constructed by Bureau of Agricultural Economics scientists, of farm operator family level of living, by counties. The increases were general throughout the U. S. In only a few counties was the level of living lower in 1945 than in 1940. Most of the counties in the upper fifth are located in the heart of the Corn Belt, the small industrialized States if the northeast seaboard, and California. Nearly all the counties in the lowest fifth are in the Southeast.

New Varieties Boost Grain: In the hard spring wheat regions where now varieties have gradually minimized farmers' losses from rust, yields have been far better as a result. In the past two years farmers have produced 100,000,000 bushels more a year of hard spring wheat because of these improvements. Yields of oats in the principal producing area have gained greatly as a result of wave upon wave of new varieties. The estimated yield has increased by more than 10 percent per acre. There have been similar improvements in barley and rice, and sorghum growing has been revolutionized by varieties adopted to combine harvesting.

Grain Improvement Speeded: The scope of the Federal-State small grain improvement makes necessary many testing stations throughout the country, a factor that has much to do with helping the farmer compete with adversity. There are 80 locations for testing wheat, 90 for oats, 100 for barley, and many for corn, rice, sorghum, etc. The good results of cooperative grain breeding are now so well recognized by farmers that a new variety of proved superiority is usually snapped up as rapidly as streamlined methods can increase the seed.

DDT Controls Powder-Post Beetle in Harvested Bamboo: Dinoderus minutus (F.) is a small bostrichid powder-post beetle that infests many kinds of stored vegetable produets in most of the warm parts of the world. In Puerto Rico, it bores into

and destroys large quantities of harvested bamboo. Infestation often begins within 24 hours after culms are stored. Where the adult beetles are plentiful, infestation may be imminent during the next few months of drying and curing. Culms of nonresistant species are so badly attacked as to be unusable and some are reduced to a mass of fibers and dust. Experiments at the Federal Experiment Station in Puerto Rico have shown that DDT prevents most of this infestation. The ordinary 5-percent residual strength in Kerosene, applied to the trimmed culms immediately after harvest, allows even the most susceptible species to cure with approximately 90 percent less damage than would otherwise occur. As curing increases resistance to beetle attack, the DDT treatment makes possible the marketing of susceptible bamboos for utilization in localities or climates where this insect is not found.

Eradication of Big Sagebrush: Effectively to improve badly deteriorated sagebrush range for livestock grazing, it is frequently necessary first to remove or reduce dense stands of big sagebrush, Research by the Forest Service at the Intermountain Forest and Range Experiment Station, Ogden, Utah, has shown that sagebrush removal not only facilitates reseeding, naturally or artificially, but also enables sheep and cattle to graze more freely. Losses of lambs from predators are sharply reduced. Sagebrush should be removed only where the danger from erosion is not high. Fairly firm soils and slopes under 30 percent are not likely to be damaged if a fairly good stand of grass promptly occupies the area or is established through reseeding.

Methods which uproot, break off, or mash down sagebrush, such as railing, ripping. harrowing, and rolling, are most effective in late summer and easly fall when the sagebrush is brittle and the soil dry. Methods which cut or tear up the sagebush, such as plowing, scraping, and grubbing are effective almost any time when weather and soil conditions permit operations. These methods should not be used in late fall or winter because the removal may effectively scatter and plant sagebrush seed that ripened during the fall. Eradication by these latter methods should be followed by reseeding, which ordinarily increases grazing capacity from 5 to 10 times.

The use of fire, properly handled, to eradicate sagebrush is the eheapest method. Preeautions must be taken to prevent damage to adjacent property, timber, or watersheds. Burning usually gives nearly complete removal. If a good stand of perennial grass prevailed before such controlled burning, it will usually take over the area, if protected from grazing during the following growing season. If a sparse stand of perennial grasses prevailed, burning must be followed immediately by reseeding. Average costs of applying these methods on an experimental basis have ranged from $0.25 per acre for planned burning to $1.32 per acre with equipment such as the wheat-land plow and self-clearing harrow. Seeding eosts are in addition.

Water Conservation Practices Compared: Catching water and storing it in the soil is vital for soil conservation in the southern Great Plains. For several years Soil Conservation Service scientists at Guthrie, Okla., tested different cultivation practices and combinations of praetices to determine those best suited to areas where rainfall is scanty and droughts may occur any year. The scientists now have conclusive evidence that both plain listing and basin listing greatly reduce run-off water losses when done on the contour. Contour cultivation reduced run-off losses 23 percent in the past 5 years. Although this is an outstanding saving of moisture, observations and trials on the watersheds show that contour cultivation alone is not sufficient to control erosions on slopes over 1.5 percent. Over a 5-year period, a eombination of terraces and contour eultivation saved an average of 42 1-2 percent more water than could be held by the old up-and-down slope methods of working cultivated fields. Beginning with the third year after terracing, crop yields were higher with the terraeing and contouring.

Future of Western Agriculture: Prospects for further development in the vast area of the 11 Western States is discussed in Long-term Outlook for Western Agriculture, a joint publication of the Bureau of Agricultural Economics and the Bureau of Reclamation. The outstanding fact in western agricultural history is the greatly increased output from only a moderately large acreage. The annual value of agricultural production (in 1926 dollars) rose from about one billion in 1910-14 to about 2 1-4 in 1939-43. The authors of the report see no reason to believe that the upward trend has reached its peak. They estimate that production in 1960 may be 30 to 40 percent above 1940. During the same period, the market for western products is likely to increase 25 to 35 percent while the population of the 11 States is expected to gain about 33 percent to a total of 18 1-2 million.

Penicillin Reduces Losses from Erysipelas in Turkeys: Bureau of Animal Industry experiments indicate that penicillin is highly effective in saving turkeys infected with the swin-erysipelas organism, to which turkeys as well as swin are susceptible. Infection in turkeys usually attacks the flock just before marketing, when the birds are most valuable. The use of penicillin reduced to mortality of infected birds to 10 percent when 100 percent of untreated birds, similarly affected by the disease, died. The drug, suspended in peanut oil, was given in doses of 20,000 units, repeated 4 times a day apart. The experiments disclosed that the best method of treatment was to inject the penicillin into the wattles. This location is preferred since the wattles are readily accessible. are not used for food, and accommodate a large dose of the drug. Another method of giving penicillin was in drinking water, but this proved to be unsatisfactory since only 7 bird in a group of 10 would drink the medicated water. That bird, however, recovered from the infection. The salts of penicillin appear to have a powerful germicidal effect on the disease organisms. The experiments, which are regarded as preliminary, included 222 three-quarter grown turkeys, treated in various ways in groups of 10.

Making Silage From Hay Crop Halves Protein Losses: Dairymen can reduce the size of next winter's protein-feed bill considerably by saving more of the protein in their home-grown forage crops. An enormous amount of protein available in hays and other harvested forages is lost through conventional methods of harvesting and storing the crops. Under humid conditions like those at the Agricultural Research Center, Beltsville, Md., more than a third of the protein in an acre of alfalfa may be lost when the crop is made into field-cured hay, even during ideal haying weather. One way to reduce these losses, and thereby actually put more of the home-grown protein in the cows' mangers in winter, is to make silage from the forage crops instead of euring them in the field for hay. This conclusion is based on txperiments by the Bureaus of Dairy Industry and of Plant Industry, Soils, and Agricultural Engineering, which have been under way at Beltsville for several years. Feeding tests with dairy cows showed also that alfalfa silage was slightly better for milk production than the hay made from the same crop at the same time. Where conditions make it difficult for farmers to produce good quality field-cured hay, the difference in favor of the silage would be much greater. Farmers, in humid regions particularly, are urged to consider shifting from hay making to silage making and to plan now for such a shift in operations. The wilting method of making silage is praetical and easy to use. Labor and maehinery costs per ton of dry matter fed are not materially different in making hay or silage. Making silage would be an effective way to insure a supply of good quality roughage and to reduce expenditures for purchased protein in winter.

Chemical Method for Determining Toxicity of Derris Root: A quick simple method for evaluating the toxicity of derris roots has been devised by the Puerto Rico Experiment Station. The method is based on the absorption of light by the toxie eonstituents of the roots dissolved in acetone and measured in a spectrophotometer at 360 mu. The transmittance value of total acetone extractives of derris roots is in close agreement with the rotenone equivalent as determined biologically on house flies. Thus the chemical method obviates the necessity of the expensive and time-consuming biological assays formerly necessary to determine the value of derris roots.

Bromegrass Best for Erosion Control: A deep-rooted and nutritious grass is one of the greatest boons to farmers who want to hold their soil and at the same time "grow profit." Smooth brome, originally from Hungary, has been spreading rapidly throughout the Northern States as farmers and stockmen speed the good word about its nutritive values and its ability to withstand drought when most other grasses are dried and dormant. This grass has proved the finest of all erosion control crops.

Grass-root studies by the Soil Conservation Service in West Virginia show conclusively that smooth brome is a deeper rooting grass than four other important northern grasses. In the top 12 to 18 inches of soil, bromegress showed 101 pounds of roots compared with 30 pounds . for orchard grass, 16 for deer tongue, 5 for timothy. and 3 for Kentucky bluegrass. Brome's much-branched, fibrous roots may penetrate the soil 6 feet or more. Its erosion-resisting root system, along with its protein-rich green growth and its adaptability to a large portion of the Northern States, probably is the explanation for the phenomenal increase in smooth brome acreage in the past few years.

Many thousand farmers in soil-conservation districts now use this grass for a soil-conserving plant in rotations, for planting on steep cultivated slopes and in field draws, for buffer strips, for sod flumes and terrace outlets, for headlands around fields, for roadside plantings, and in many other places where conservation plans call for a thick deep sod. Its large quantity of tough roots makes it an excellent ground binder, which stands considerable abuse as well as silting and flooding. When mixed with alfalfa, it has no equal for hay or pasture. Bromegrass has been tested, also, for its ability to improve soil infiltration under frost and frozen soil conditions. In Michigan, hydrologic investigations by SCS revealed that during a storm, when 2.77 inches of rain fell on a brome-alfalfa watershed with a thin layer of frozen soil at the 6-inch level and 2.41 inches fell on an unfrozen woodland, there was more runoff from the woodland than from the brome-alfalfa sod. Neither lost any soil, but one-half ineh of clear water ran off the borme-alfalfa and 3-4 inch from the woodland. Corn stubble, the horrible example, lost 1,009 pounds of soil per acre in 1 3-4 inches of run-off. The unusual aspect of the measurements, the hydrologists report, was that the woodland soil was unable to hold permanently as much of the rain as was the brome-alfalfa with its remarkable root system and tremendous moisture-holding capaeity.

Slow Nitrogen Fertilizer: A slow-acting nitrogen fertilizer that feeds crops over a long growing period has been developed by soil scientists of the Department of Agriculture. The fertilizer is one of a series of combinations of urea and formaldehyde, known as Uraform. It is produced at present only on a laboratory scale. Results of laboratory and greenhouse tests with the material were recently demonstrated by Dr. K. G. Clark, Jew Yam Yee, and Dr. M. S. Anderson at a Soil and Fertilizer Conference at Plant Industry Station, Beltsville, Md. The results indicate that Uraform is superior to natural organics in supplying nitrogen at a uniform rate over a long growing period. Unlike commercial nitrogen fertilizers now used, Uraform does not leach out of the soil easily. It offers promise as a source of nitrogen for corn, potatoes, and tobacco crops whieh ordinarily need additional fertilizing after they have been planted. Applieation of Uraform at planting time would save labor. Its delayed action and long duration would also make it a valuable fertilizer for lawns and other grasses. The tests show that Uraform may be used in mixed fertilizer as well as in separate applications. Because it does not appear to be affested by moisture absorption, Uraform offers possibilities as a conditioner that prevents caking, often a serious problem in mixed fertilizers.

Who Gets the Consumer's Meat Dollar? The way in whieh the consumer's dollar spent for meat is divided among livestoek produeers, markets, wholesalers, retailers, and packers is discussed in a report from the Bureau of Agricultural Economics by Knute Bjorka. In 1939, it was estimated, 51 cents of the consumer's dollar was received by livestock producers. Retail distribution took 24 cents, wholesale distribution almost 6, meat packing nearly 15, and marketing slightly more than 4. The report also discusses the methods of reducing costs and improving the efficiency of markcting and processing.

Reseeding Abandoned Lands: Research on range reseeding conducted by the Forest Service in the West has produced specifications and guides by which several types of range lands can now be reseeded to good forage species with reasonable success. Within a few years after reseeding, abandoned crop lands produce many times the forage they produced after abandonment. Left to revegetate naturally, 40 or more years are required for restoration to a good forage cover. It is particularly fortunate, in view of the expansion of dry-land wheat acreage during the second World War, that adaptable species have been determined and economical reseeding methods developed. As the demand for wheat decreases, it is inevitable that large acreages of land, sub-marginal for permanent crop production, will be abandoned. Newly abandoned stubble fields offer nearly ideal conditions for seeding crested wheatgrass and other forage grasses with ordinary farm equipment. Delay in reseeding after abandonment increases the possibilities of infestation by cheatgrass or weeds, which increases costs of reseeding and reduces the chances for success. Prompt restoration to forage production of abandoned areas contributes to greater production of range livestock and their products and reduces the possibilities of soil blowing and erosion, particularly in the event of prolonged drought.

Fruit and Vegetable Concentration Markets: Since 1925, the concentration markets have been used increasingly by small lot growers in Southeastern States. These markets are the subject of a joint study by the Bureau of Agricultural Economics, Experiment Stations of North Carolina, South Carolina, Georgia, and Alabama and Georgia Extension Service. Relatively low cost of operation is chiefly responsible for the success of these markets. Improved motortruck transportation, dissatisfaction with other kinds of markets, belief that marketing charges are too high, and need for additional outlets also have contributed to their success. In three-fourths of the markets in the survey, at least 90 percent of the products sold came from within 25 miles of the market. The majority of sales were made to resident buyers. The most successful operation methods in the eoneentration markets are discussed in detail in the study.

Plant Growth-Regulating Chemicals: In recent years plant growth-regulating chemicals, sometimes called hormonelike substances, have proved useful in agriculture in several important ways. It started with the discovery by scientists in Holland and in this country that applications of indoleacetic acid stimulate readier rooting of cuttings ordinarily difficult to root. Wide knowledge has gradually accumulated regarding this and similar chemicals. Mueh work has been done by scientists at the Plant Industry Station, Beltsville, Md., and by research workers at some State experiment stations. Growth regulators now in use are products of the chemical laboratory and therefore cannot properly be known as hormones, but as hormonelike substances, since they do not occur in nature.

After about 10 years' work by researchers, the uses of these substances in the order of their economie importance are: Weed killers (2. 4-D); preventives of preharvest drop of certain varieties of apples and pears (2, 4-D and alphanaphthaleneacetic acid); rooting of cuttings (indole-butyric acid); prevention of sprouting of stored vegetables such as potatoes and root erops, and plants such as rose bushes (ethylnaphthalene acetate); and fertilization of greenhouse tomatoes to increase fruit set—often poor under glass—and to better the yield and speed up ripening (indole-butyrie aeid). Other responses not yet used commercially but whieh show promise are: improving the storage quality of eertain varieties of apples especially subject to scald (naphthaleneacetic acid); hastening ripening of fruit, such as bananas, by spraying with 2, 4-D; and insuring the setting of numerous, large, well-colored berries on female holly plants by treating the blossoms with naphthaleneacetic acid.

Scientists of the Bureau of Plant Industry, Soils, and Agricultural Engineering have contributed much to the full use of these chemicals, including controlling many broadleaf weeds with 2, 4-D, delaying fruit-drop, preventing sprouting in stored vegetables and plants, reducing scald in stored apples, hastening ripening of certain fruits, and hurrying fruiting of holly. The scientists believe it may be possible to combat weeds before the cropping season by treating the soil or manure piles so as to kill weed seeds at the germinating stage or immediately before.

Up to the present this new way of killing weeds has applied only to broadleaf weeds, such as dandelions, plantain, and many others, but not to the grassy ones—crab grass, quack grass, etc. Now investigators at the Station are busy studying new growth regulators, including one found by British scientists, called isopropyl-N-phenyl carbamate (1PC, for short). To some extent it does what 2, 4-D doesn't do. Under certain conditions it kills some kinds of grass seedling and lets the broadleafs grow. So far the investigators have made some convincing demonstrations in the greenhouse with mixtures of sugar beets and quack grass growing in pots.

Most Farm Workers Receive More Thman Mere Wages: It has long been a custom for American farmers to furnish their hired laborers with various goods and services in addition to paying them in cash. To determine the extent and importance of these prequisites, a survey was made by the Bureau of Agricultural Economics. It showed that 89 percent of U. S. regular hired hands and 60 percent of the seasonal farm laborers received perquisites. Houses, food products from the farm, and room and meals were the most common types furnished regular workers, while the noon meal was the most common type furnished seasonal workers. Perquisites are about a fourth of the average farmer's wage costs for regular hands, but only about a tenth of his costs for seasonal workers.

Hybrid Vigor in Various Crops: Hybride corn has given farm produe tivity a big lift, but it is only a beginning of what hybrid vigor in plants ean be made to do for us through increasing the capacity of crop plants to make food, feed, fiber, and industrial raw material. Hybrid vigor—the geneticists call it heterosis—has been made widely useful in increasing the yield of plants.

An established hybrid crop variety that possesses heterosis or hybird vigor (such, for example, as the present-day corn and onion hybrid) is the first-generation cross of inbred strains or strains which differ in their genetic composition. Those strains are maintained year after year for seed produetion, as hybirds have no standard independent life. They are artifieial in the sense that they could not be kept up on the ordinary farm except by the specialized farmer who grows new seed for a fresh start eaeh spring. There have long been socalled crop hybrids that are not classified as hybrids in the modern sense. These are really the result of seleetion from the progeny of a eross and produce their own seed. There are still some varietal names that include the word "hybrid" although the varietie sare not hybrid in the rybrid-vigor or heterosis sense, simply improved varieties selected from hybrids.

Corn hybrids in the short period of 25 years have gained 15 to 20 percent over open-pollinated varieties and have caused the farming public to expeet similar improvements through the utilization of hybrid vigor in other crop plants. Informed scientists say these expectations will undoubtedly be fulfilled with respeet to a number of our important crops.

It is relatively simple to produce hybird seed corn because the wide separation of silks and tassels permits the ready detasseling of plants that produce the usable seed. Most crops other than corn have flowers which not only carry both the male and female elements but also are

THE FORUM

The Modern Farmer

Published monthly by the Modern Farmer at Nashville 3, Tennessee.
Giles A. Hubert,_____ Contributing Editor
_____ Secretary
Sadie Wilson _____
Henry Allen Boyd_.___ Publisher
Office, 403 Charlotte Avenue.

Devoted to the interests of the Farmer, Truck Gardner, Livestock and Poultry, Breeder, the Home and the People.

Entered as Second Class Matter, April 10, 1929, at the Post Office at Nashville, Tenn., under act of March 3, 1879

All contributions for publication in the Modern Farmer, should be addressed to The Modern Farmer, 403 Charlotte Avenue, Nashville 3, Tenn.

No libelous matter will be published. Unsigned articles or letters, and those written on both sides of the paper will not be used.

Subscription price $1.00 per year, 75c for six months, payable in advance. Personal checks must be certified. Make all checks or money orders payable to The Modern Farmer.

Advertising rates and sworn circulation figures presented upon application.

Specialist Says

(Continued from page 1)

pares with 53 percent in 1940 and 63 pereent in 1930. As for colored tenants and eroppers, the number has decreased from 46,443 in 1940 to 39,794 in 1945, but ownership has increased from 10,550 to 11,469 during the same period.

Says Mr. Brown, "Most Arkansas tenants and sharecroppers are in the Delta area. Apparently, cotton production and tenancy still go hand-in-hand. As yet not enough mechanical cotton pickers, choppers, and flame cultivators are on cotton farms to change the tenant situation very much, but as more and more of these machines come into use in Arkansas, farming is due for some revolutionary changes."

Continuing, he says, "Biggest change is expected in the number of croppers and tenants in the Delta. As owners shift to machine power, hired workers probably will replace tenants and croppers. Many of the hired workers will be former croppers and tenants trained to operate the machines." ,

Mr. Brown expresses the belief that if present trends continue, we may expect more farm work to be done for wages instead of a share of the erop. As croppers and tenants are replaced by machinery, the trend will be toward fewer and larger farms. This trend, he says, can mean better ineomes and better living on farms, with more food and fiber at lower cost for eonsumers. However, the trend will depend upon whether or not job opportunities continue for workers off the farm. Otherwise many workers may pile up on small farms and hold back the machine age in the South, the farm management specialist asserts.

Carver Peanut Research

(Continued from page 1)

growing, harvesting, and curing the crop; inseet and disease eontrol; fertilizer and other soil management practiees. Research on grading and inspeetion and on the development of new industrial uses for peanuts also are ineluded in the recommendations.

Sunrise Orchestra

By J. P. Batchellor

Have you heard this Sunrise Orchestra?
No? Then you've missed a treat!
Robin red breast sings the Theme Song,
Old black crow keeps the beat.

Song sparrow adds staccoto,
Sleek grackle plays the traps.
If you really have not heard them
Forego your morning naps.

They're not a bit exclusive,
No dates the leader keeps,
But I know "on authority"
They're booked ahead for weeks!

Byrd's Nest

(Continued from page 1)

degree. God never judges one man by what another does: He judges a man's results by what he could have done. The spirit of God in a man causes him to know that however limited his ability may be, God needs and welcomes his effort. And too, men are often affected by that termite of sin which makes one feel that because he made one mistake, one failure, or did some wrong that he is completely unworthy and unfit for service. The spirit of resistance to sinful termites teaches one that he is not to stop and become useless because of his past failures, but rather he is to profit by those mistakes. Men and women often get to themselves and ponder day and night over the things they have done which did not come up to the standards and while pondering Satan takes advantage to make them fruitless and useless, but when one is living with the spirit he is willing to forget those things which are behind and press toward the mark of perfection in Jesus Christ.

Cotton Research Problem

Cotton and cottonseed research should be undertaken in five major problem areas, says the Cotton Advisory Committee and the Cottonseed Advisory Subcommittee, appointed under the Research and Marketing Act of 1946. The problem areas are: Produetion, ginning and marketing, utilization, foreign markets and competition, and supply price analyses.

Consumers' Needs Studied

In a recent address, Dr. Paul H. Nystrom, Professor of Marketing at Columbia University, said that one characteristie of present-day retail merchandising has been greater interest in the consumer.

That interest has been shown in many forms. One form has been the effort of retail stores to hold down prices as much as possible. Another has been their negotiations with manufacturers to improve qualities. Still another has been the very great improvement that has taken place in methods of display and packing. And lately, there has been increased emphasis in training sales personnel so that they will better understand and meet the needs of the consumer.

Elsewhere in his talk Dr. Nystrom forecast that competition will rise sharply—but that prices will remain high for a long time to come. This is not, under present eonditions, a contradietion in terms. Labor eosts are still in the upuward eyele, and this is direetly reflected in all other costs borne by manufacturers and distributors. Our government's foreign policy, necessary as it may be, tends to keep prices high due to heavy spending in the American market for foreign aid. And our now well-established domestie fiscal policy of enormous government spending, aside from military needs, adds more fuel to the fires of inflation.

Despite all this, American industry— including manufacturers, processors, wholesalers, retailers and all other cogs in the production machine—is doing a job for our people that is unrivalled on this earth. As an example, the average Russian worker must toil three weeks to earn enough money to buy a pair of shoes of questionable quality— his American counterpart can buy a fine pair of shoes for less than he earns in one day. A worker in Spain must put in a hard twelve or fifteen hour day to buy enough food for bare subsistenee—here a fraetion of labor's earnings pays for an exeellent diet. So it goes throughout the world—with the American system demonstrating its superiority in every eoneeivable manner.

Farmers Are Advised to Save for Lean Years

Washington, D. C., July 22, 1947—Dear Mr. Hubert: When one of the Nation's leading agrieultural colleges take turkey . . . it's time to give its views some special consideration.

Agricultural colleges generally are somewhat conservative. It's certainly rare that they will enter into economic predictions on a wholesale basis.

But, consider the statement of the Missouri College of Agriculture, in a recent publication:

"The (farmer's) REAL income in (the four 'lean' years) 1931-34 would have been 37 percent higher . . ." if he had "invested 10 percent of his income in the four 'fat' years from 1917 to 1920 in the kind of bonds now available—Series E. U. S. Savings Bonds.

"The reason for the small investment in 1917-1920 adding so much more to the real income in 1931-34," the report continues. "is that the bonds would have been worth 1-3 more in 1931-34 than they cost in 1917-20, and each of those dollars would have bought 40 percent more."

The College adds that such an investment **"could have saved many from serious hardships and perhaps insolvency."**

Today the farmer has bought something less than 9 percent—only $6 billions in Savings Bonds—of his net income for the five "fat" years he has had. In spite of floods and other adverse conditions, it is expected that 1947 will still be another "fat" year for many farmers —perhaps the last really good year for some time to come.

To me, the fact that farmers must be adequately proteeted by Savings Bond investments against any economie contingency is what the economists and financiers are talking about when they say "we must keep the national debt widely spread among individuals, without increasing the debt." This is the main purpose of the United States Savings Bonds Division.

Selling Savings Bonds to individuals, including farmers, gives everyone a ehance to receive some of the interest on the national debt which we are all taxed to pay. That's another faetor in this wise management of the national debt; another reason why it's so important for everyone to be given an opportunity to put money in the world's best investment—UNITED STATES SAVINGS BONDS.

Within a few days you will get a letter from Eli Harris of my staff which will tell you exactly how we can help you attain the goal of adequate protection for your subscribers.

Cordially yours,
VERNON L. CLARK
Assistant to the Secretary

Site for $75,000 4-H Camp

A 267-acre plot spreading along Lake Marion near Orangeburg is the site on which the Extension workers of South Carolina plan to build a $75 000 4-H camp for colored farm boys and girls of that State. Dormitories, recreation hall, workshop, and model farm homes are included in the plans. Shown looking at the 4-H camp site are left to right: John W. Mitchell, Extension Service field agent; Mrs. Marian B. Paul, State home demonstration supervisor, and E. N. Williams, State Extension supervisor. The camp will be named in memory of Harry Daniels, late Extension supervisor, who served the State for more than 25 years.

Virginia Extension

(Continued from page 1)

Mr Newsome says that the demonstrations now being conducted involve 3,485 acres of crops, 788 head of livestock, and 28,747 head of poultry. Hybird corn demonstrations top the list of field erops. They total 226 on 1,230 acres.

Four-H Club boys and girls in Virginia, also are carrying out result demonstration projects, reports the State extension agent. He says that about 14,000 colored farm boys and girls are enrolled in clubs in the States. Volunteer local leaders, numbering nearly 600, are assisting the extension agents with the 4-H projects.

Fire Prevention Paid Dividends

What carcful planning against the possibility of fire can accomplish was dramatically demonstrated in Los Angeles harbor in late June when a tanker which had just taken aboard nearly 3,000,000 gallons of fuel blew up at the dock.

Billowing flames instantly spread to near-by shore installations. The intense heat blistered paint on several huge oil tanks on a 30-acre tank farm belonging to the Shell Oil Company. Had the tanks blown up, devastation would have been wreaked throughout the entire heavily-populated Los Angeles-Long Beach harbor area.

However, the tanks were equipped with waterspouts on top, and these prevented further explosion. Thus, one precaution was responsible for saving lives and tremendous property damage.

This is the way scientific fire prevention stands between the community and catastrophe. The kind of planning which led to the installation of protective devices on oil storage tanks can be applied to every home and every business. In most instances, adequate precautions are simple, and require little time or money. The man who fails to plan against fire is inviting disaster.

Farm Safety Week

One out of five farm accidents can be avoided simply by keeping farm implements and tools in their proper place, says the National Safety Council on the eve of Farm Safety Week which was observed July 20-26.

The Counell recommended that farmers eheck through the farm shop to see that hammer and axe handles are secure and in good condition; also check to see that all tools are in their proper place. Keeping tools in their right place not only helps avoid aecidents, but it also nelps the farmer save time.

Short Corn Crop Forebodes Livestock Cut, High Meat

Washington,—(AP) — Continued high meat prices and some reduction in livestock production next year was indicated yesterday by an agriculture department report foreeasting a sharp drop in this year's corn crop from wartime levels.

The prospective crop of this important feed grain was forecast at 2,612,000,000 bushels, whieh is slightly below the 10 year (1936-45) average of 2,639,192,000 bushels. The wartime crop averaged around 3,000,000,000 bushels while last year's production was a record of 3,287,927,000.

The department, which had set a corn produetion goal of $3,000,000,000 bushels, said one of the most adverse planting seasons of record—cool and wet cloudy weather and floods in the midwestern corn belt—was responsible for the expected reduction in corn.

PLANTED LATE, FROST DANGER

A crop of around 2,850,000,000 bushels, of good quality corn would be needed to maintain livestock production at present levels. With much of the erop planted late, there is danger that an early frost may catch it before it is matured, and reduce its feeding quality.

The effeet of a relatively short crop of corn in the production of livestock products would be less serious, from the food supply standpoint, if other feed grain crops were larger than indicated. But they were forecast at about average.

On the brighter side was the department's forecast of an even larger wheat crop than predieted a month ago. It estimated wheat at 1,435,551,000 bushels, or about 25,000,000 more than a month ago, 280,000,000 more than last year's record and 545,000,000 more than the ten year average.

POTATO CROP REDUCED

The potato crop was forecast at 351,674,000 bushels which is 26 per cent smaller than last year's record crop and the smallest since 1939. Potato consumption averages about 375,000,000 bushels a year.

The department's report said eurrent crop prospects are surprisingly good, considering the adverse growing conditions which prevailed through mid-June. The total acreage of crops for harvest was said to be 1-2 of 1 per cent acreage.

"A neighbor, Jed Hill, said that if he had not snatched the bun out of the young woman's hand, she probably would have killed her husband. — SANFORD (Ky.) OBSERVER.

Important Recent Achievements of Department of Agriculture Scientists

(Continued from page3)

small and so do not permit simple removal of the male or pollen-bearing structures. The production of hybrid seed of such plans is not economically feasible. However, the sicentists have overcome this difficulty in some cases by taking advantage of such peculiarities as male-sterile or self-sterile plants. A male-sterile plant has either no pollen or pollen that does not function, while a self-sterile plant is one whose flowers must be fertilized by pollen other than its own to produce seed. In the hands of plant breeders these factors are highly useful as they can be bred into various strains which can then be used as female parents in the production of hybrid seed for commercial growers.

A few years ago scientists of the Bureau of Plant Industry, Soils and Agricultural Engineering and the California Experiment Station discovered a male-sterile onion. This simplified the crossing and made possible the growing of hybird seed on a commercial scale. The first hybrid onion, California Hybrid Red No. 1, is now established in some areas in the West, giving early onion producers from 25 to 50 percent greater yield than they were able to get with the old open-pollinated varieties. Even more important is the fact that the geneticists at the Plant Industry Station, Beltsville, Md., have bred this male-sterility factor into other varieties and types of onions. This means that ultimately growers of all sorts of onions may be able to get hybird seed and have added vigor in the crop.

The onion, like most plants, has open blossoms from which pollen moves naturally or can be moved from flower to flower with relative ease, an important factor in crossing. In the case of alfalfa the geneticists are using self sterility to produce hybrids in much the same way that inability to produce pollen was used to develop a practical hybrid onion for commercial growing. The small size of the flowers and closeness of the male and female parts are no particular obstacles under such conditions.

In addition to the various kinds of hybrid corn and the hybrid onion seeds of other hybrids have appeared on the market recently. Among them are tomato cucumber, and squsb—real hybrid possessing hybrid vigor.

The Station scientists are no inclined to make sensational predictions, but they say that the discovery of male-sterile grasses, sorghums, and sugar beets, and the practical use of the hybrid previously mentioned are reasons to believe that there will be more and more crop hybrids, as both public and private plant breeders continue their work.

Wartime Nutrition at High Level: The national food supply furnished civilians with an unusually high level of nutrition during the war, according to a joint study, Nutritive Value of the Per Capita Food Supply, 1909-45, made by the bureau of Agricultural Economics and the Bureau of Human Nutrition and Home Economics. Although the wartime food supply provided less calories and carbohydrates, the amounts of other dietary essentials were equal to or higher than in any other period since 1909. Increased consumption of almost all foods, particularly of milk, eggs, vegetables, and citrus fruits, plus the enrichment of white flour and bread, accounted for this high level of nutrition.

Farm Costs High—Returns Higher: High production and favorable prices in 1946 boosted the net returns of families operating 14 major types of farms well above their wartime peaks, a study by Ronald W. Jones, of the Bureau of Agricultural Economics, shows. Costs in 1946 were higher too, but took a smaller proportion of gross income than they did in prewar. Gains in net income in recent years were smallest on dairy and cotton farms where production has increased least and cost rates have advanced most.

Dehydrofreezing process Preserves Foods: A new process of food preservation that combines most of the advantages of derydration—namely, reduction in weight and volume—with freezing, has attracted much interest among food processors. The process, termed dehydrofreezing, was developed by the Western Regional Research Laboratory of the Bureau of Agricultural and Industrial Chemistry, and involume economies dehydrofreezing the first cycle of dehydration, and then freezing. Since the vitamins and flavor are virtually undamaged by this initial dehydration treatment, the product retains the fresh quality, and in some instances, notably boysenberries and apricots among the fruit products investigated, it retains the original shape. In consequence of the weight and volume economics, dehydrofreezing effects savings in packaging materials. The load on refrigeration systems also is materially reduced. Reconstitution of dehydrofrozen foods is easier than that of dehydrated foods because of the greater moisture content of the former. Implications for the fruit and vegetable industries are lowered transportation, storage, packaging, and refrigeration costs.

Cottonseed Handling with Small Air Pipes: A mechanical system of seed handling with small air pipes, developed by engineers of the Bureau of Plant Industry, Soils, and Agricultural Engineering at the U. S. Cotton Ginning Laboratory, Stonesville, Miss., is now used in more than 500 gins in the Cotton Belt; it keeps cottonseed pure and uncontaminated. More of the small-pipe systems are being installed every year. In operation they consume less than half the power required in older seed handling systems. For handling grains, granular bulk materials, and various kinds of trash, the small-pipe systems are described by the engineers as economical and trouble-free. They enable the cotton producer and ginner to preserve the purity of the cottonseed because the equipment is self-cleaning. They have adequate capacity for moving from 70 to 160 pounds of cottonseed per minute from the gins—as fast as the cotton is ginned.

Light weight, these small-pipe systems are portable and can be used for loading from trucks to railroad cars at inland trackage points and for emptying the cars at seed breeders' treating and delinting plants, where the seed may be carried to storage bins and later moved to grading, sterilizing and other processes at rates of handling to suit plant capacity. Cottonseed has been successfully handled by them for distances up to 700 feet. Installation costs are very little more than for the larger pipe and fan system commonly used. The older types operate on 10 to 15 horsepower, but the small pipes require only 3 to 7 horsepower.

Better Home Canning of Low-Acid Foods: Three years of intensive research on household canning methods have enabled the Bureau of Human Nutrition and Home Economics to recommend new and improved processes (temperature and heating times for food in a canner) for home canning of low-acid foods. These foods include meats and practically all vegetables, except tomatoes, commonly canned in home kitchens. Procedures previously recommended were based mainly on industry's research. This work had shown that steam pressure is essential to safeguard low-acid food against botulism. When adapting industrial processes it was customary to lengthen them considerably to provide safety margins, since housewives could not copy industrial methods and precision. Hence excessive processing often made home-canned low-acid foods unattractive and low in vitamins.

In the Bureau's research, more than 4,000 glass jars and tin cans of beef, pork, chicken, and 12 low-acid vegetables were prepared, packed, and processed in home-type steam-pressure canners in the way homemakers do the job. Temperature changes inside pars and cans were recorded by sealed-in termocouples. To verify the amount of heat required to sterilize the foods, some packs were experimentally inoculated with bacteria even more heat-resistant than the botulinus bacillus. According to results of this work, vegetables in pint glass jars, and some in quart glass jars, may be processed at home in 25 to 50 percent less time than was previously recommended. It is necessary to lengthen processing times for a few vegetables, if quart-size glass jars are used. The new processing time for foods home canned in tin are quite similar to those in commercial use. For home-canned meats processing temperature has been set at 240 degrees F. (10 pounds pressure), replacing 250 degrees F. (15 pounds pressure) formerly recommended.

These improved directions offer important advantages to the 20,000 or more American families that annually can some of their own food supply. Using a steam-pressure canner, homemakers may now turn out a product which combines safety with better flavor, texture, and nutritive value than in the past, and at a saving of time and fuel. Since the new processes make safe canning more attractive, there is prospect that more homemakers will adopt the steam-pressure method for low-acid foods, which cannot be safely canned in a boiling water bath, oven, or open kettle. Aside from dubious safety, spoilage due to inadequate processing of home-canned foods has been excessive. In one recent year, spoilage of low-acid vegetables alone due to improper canning methods was estimated at a $1,500,000 loss.

More Eggs from Less Feed: Eggs account for more than half the income from poultry, although the rapid increase of the broiler industry in the last 50 years has been a significant development in poultry keeping, according to T. C. Byerly, poultry specialist of the Bureau of Animal Industry. In general it takes about a pound less feed to produce a dozen eggs than it did 50 years ago. Three average hens nowadays lay as many eggs as four average hens did 50 years ago. An increase in eggs per hen probably is the most important poultry gain during the half century. This is due primarily to the careful work of poultry breeders who have applied skillfully knowledge gained through experience and research in poultry genetics.

Raindrop Erosion: When raindrops strike bare soil, or thin films of water covering it, particles of clay, silt, and sand and bits of fine gravel fly through the aid like tiny rockets. This is splash erosion. Much unprotected soil can be moved by splash erosion, depending upon soil type and velocity of raindrops. Experiments carried out by the Soil Conservation Service at Coshocton, Ohio, indicate that 8:25 inches of artificial rainfall, falling at a velocity of 19 feet per second, caused a 1-inch layer of soil to erode and splash away. This seems bad enough, but when the raindrop velocity is increased to 35 feet per secone, the erosive action is 10 times as great. Moreover, the impact of raindrops on bare soil breaks down soil aggregates and seals the surface so as to reduce the rate of water infiltration into the soil. Farmers have science on their side when they prefer slow, soaking rains to hard thundershowers. Vegetative cover that breaks the impact of raindrops offers the best known means of preventing splash erosion. The Coshocton studies give added proof of the value of winter cover crops and stubble-mulch practices.

Rapid Method of Detecting Compression Wood: A simple electric-light box was devised by the Forest Products Laboratory of the Forest Service for the quick detection of compression wood, an abnormal type of wood produced on the lower side of leaning softwood trees. Such wood has erratic strength properties, shrinks excessively and unevenly along the grain, and is unusually hard and unsuited for many uses. Only an experienced eye can detect it. The box throws a beam of light through thin cross-sections of wood and thus shows up compression wood even to unskilled workers, because it is much more opaque than normal wood. It should find many uses in shops employing refined construction methods for aircraft, ladders, masts, oars, structural members of buildings, and even boxes, in all of which compression wood is objectionable.

Cotton Gin Improvements: "Mistifiers," which eliminate static electricity generated by movement of dry cotton through a gin and permit ginning of full-weight bales, have been investigated by agricultural engineers of the Bureau of Plant Industry, Soils, and Agricultural Engineering. Static electricity causes cotton to bunch up, clogs the gin machinery, prevents line from packing uniformly in the press box, and creates a fire hazard. The engineers found that adding sulfanated oil mist to the lint eliminates the static and permits better, continuous ginning and pressing of the line into full-weigth bales. The "mistifiers" are being tested in 18 commercial gins. New cotton-cleaning systems increasing bale value $8 to $16 each have been devised by the engineers in the past year. Superimposed upon regular ginning equipment, the cleaners remove dirt, leaves, sticks, and other trash that accumulate inordinately in machine-picked cotton.

Introduced Bamboos Valuable: For several years the Department of Agriculture Experiment Station in Puerto Rico introduced various species of bamboo, and in 1935 more extensive work was undertaken in this field. At present 36 species and varieties have been established on the station grounds. Eeveral have been found highly resistant to the bamboo powder-post beetle which often destroys cut culms. As a result of these introductions Puerto Rico now has a splitbamboo fishing rod industry and a bamboo furniture industry, employing over 100 people. It is hoped to duplicate these industries in many small mountain communities of the Island with serious rehabilitation problems. During 1946, 18,062 bamboo offsets were distributed for planting. The Puerto Rico Development Company has set up a purchasing center for buying cured culms of bamboo from local farmers.

Breeding Better Hogs: Faster-growing hogs of superior conformation and greater liveability are resulting from erperiments of the Regional Swine Breeding Laboratory, Ames, Iowa, conducted by the Bureau of Animal Industry and 13 State agricultural experiment stations. The research involves carefully planned systems of mating in which inbreeding, signifying the use of closely related parents, has a prominent part. The main purpose of inbreeding is to fix desirable characteristics. Hogmen, using their farms as proving grounds, are cooperating with the scientists by testing boars produced by the various systems of breeding. Thus far, over 500 boars from the various projects have been released to farmers for practical tests of breeding excellence. Five breeds and 3 lines from crossbred foundations are represented in the research. The degree of inbreeding in most of the lines ranges between 25 and 50 percent. Experiment-station data, with reports from farmers, indicate that mating boars from good inbred lines to noninbred sows results in about 100 pounds more weight per litter, when the pigs are 6 months old, than that of litters sired by non-inbred boars of the same breeding as the sows. Crosses involving three inbred lines, all within the same breed, are a promising method of growing still more pork per mating.

Tailoring Tools to Contour: Not long ago, potato farmers in the rolling-hill country of Aroostook County, Maine ,ewer on the horns of a dilemma. If they kept on farming up and down hill, they would eventually lose all their topsoil and be forced out of business. But when they put in terraces and farmed on the contour, they had machinery troubles. Conventional planters, sprayers, and harvesters simply did not produce best results. These Maine farmers had a lot at stake. Theirs is a fine potato county. Aroostook County farms yield an acerage of 275 bushels of potatoes to the acre. Each harvest around 12 million barrels of spuds are sent to marwet or put in storage. For tunately, they could rely on the scientific knowledge of Soil Conservation Service reseahchers and engineers. In particular, they had the help of John W. Slosser, who spent several years redesigning potato machinery for efficient operation along hillsides.

Take the potato sprayer, for example. The old type multiple-row sprayer, with rigid cross boom, gave trouble over terraces and along fairly steep slopes. The up-hill nozzles were too high; the down-hill nozzles too low. Slosser set to work and came out with a new principle. On his sprayer each boomlet slides along the ground on a metal shoe. Thus the nozzles are always the same height from the ground—the right height for an efficient job. Slosser also rigged up a tank truck that carries 770 gallons of water, meters out the spray chemicals, and then makes a perfect mix.

Then Slosser tackled the multirow planters and diggers—again with happy results. He hinged the working parts of a 2-row pull-type planter to a bar controlled by the soil surface. Not only does this insure proper depth and spacing, but the planter can be operated by one man instead of the two commonly employed. On the potato digger Slosser doubled efficiency by hinging the rear of the digger blade and elevator to follow the ground level. Then he arranged a crank and leveler so that the rear wheels and the separating platform can be leveled for side-hill operation. The majority of Maine potato farmers are now saving their soil and producing excellent crops, though some machinery problems remain to be solved, and are still under study.

Ethly Alcohol Production from Wood Waste: Since construction began of an Oregon plant to produce ethyl alcohol from Douglas-firwood waste by a laboratory-devised process, the Forest Products Laboratory of the Forest Service, through continuing research, has increased the plant's potential output from 4,000,000 to more than 5,000,000 gallons annually. The research makes possible a continuous process of wood hydrolysis rather than the batch process hitherto used in Germany and elsewhere. The time necessary for hydrolysis has been reduced to one-eighth that used in the German Scholler prcess, and simultaneously the yield of alcohol per ton of wood has been stepped up by about 10 percent. At the same time better fermentation methods were developed by which both yield and concentration of alcohol from wood sugar are increased. Moreover, it was found that, on the residue remaining in the still after removal of the alcohol, fodder yeast rich in vitamin content could be grown at the rate of 2 pounds of dried yeast per gallon of alcohol produced.

Motor Fuel and Other Products from Agricultural Residues: A process for converting corncobs, sugarcane bagasse, peanut and oat hulls, cottonseed hulls and burs, and flax shives into sugar solutions for fermentation and chemical processing into liquid motor fuel (with several byproducts) has been developed on a laboratory scale by the Northern Regional Research Laboratory of the Bureau of Agricultural and Industrial Chemistry. It is a continuous 2-stage process for converting the cellulose of such materials into a solution of dextrose, and the hemicellulose (principally xylan) into a solution of xylose and furfural, leaving the lignin as an insoluble residue. In the first stage about 95 percent of the xylan is converted by treatment with dilute sulfuric acid into xylose and a small amount of furfural. In the second stage the cellulose is converted into dextrose by a novel procedure that includes impregnation of the dried material with concentrated sulfuric acid at a low temperature. The conversion is accomplished in 1 to 2 percent of the time and with less than 25 percent of the acid required by other known concentrated-acid processes. The xylose can be converted by known chemical processes into furfural, an important material for chemical industries, or, after the small quantity of furfural in the original xylose solution is removed and the solution is neutrallized with lime and filtered, the xylose can be recovered in crystalline form or mixed with dextrose and converted by bacterial fermentation into butyl alcohol and acetone.

The dextrose solution, resulting from digestion of the acid-impregnated cellulosic material with water, can be fermented with yeast into ethyl alcohol. Crystallization of the dextrose may offer commercial possibilities. This process was recommended by the Department of Agriculture for further trial on a semiworks scale as a part of the Government program for the development of synthetic liquid fuels from nonpetroleum sources. The research is now moving into semi-commercial-scale production at a new plant recently constructed under the Synthetic Liquid Fuel Project at Peoria, Ill. This plant is designed to handle enough agricultural residues to produce at capacity 2,000 pounds of glucose in 10 percent solution, 1,600 pounds of xylose in 15 percent solution, 200 pounds of furfural, and 1,000 pounds of lignin in an 8-hour day. From the fermentable material 500 gallons of alcohol can be made per day. This experimental work will accomplish two purposes. It will

show maximum yields of various products from a given tonnage of different agricultural residues. and will provide a basis for computing costs and determining the feasibility of commercial production.

Favorite Tropical Lawn Grass: Since 1936 the Department of Agriculture Experiment Station in Puerto Rico has been experimenting with **Zoysia matrella,** or Manila grass. for use on tropical. lawns. This grass has received publicity in the States as an ideal lawn grass. In Puerto Rico under tropical conditions it has proven superior to such commonly used grasses as Java, Bermuda, centipede, St. Augustine, and carpet. Manila grass has a pleasing, moderately deep shade of green, grows slowly, requires less attention in weeding and mowing, produces a thick mat which feels like a heavy rug under foot, has no serious insects and diseases, withstands drough, and grows well in moderately dense shade. It is tough and withstands considerabe foot wear, but is difficult to cut with a hand lawn mower. A rotary-power mower. however, cuts it easily. At present the grass must be propagated by sod blocks, but the station is seeking a seed treatment to induce higher germination. Seed is produced abundantly in Puerto Rico. but little seeding has been reported under most conditions in the United States.

Starfish Meal for Growing Chickens: Starfish, though a serious pest in oyster beds, may be an asset to poultry growers, the Bureau of Animal Industry coneludes from a series of tests of starfish meal fed to young growing chickens. Shortages of protein feeds for livestock led research workers to experiment with several materials formerly discarded or poorly utilized by various industries. One was starfish, which oystermen take in quantity in cleaning oyster beds. Whole starfish, when sun dried and ground into meal, contains about 39 percent protein, 19 percent calcium, and smaller quantities of other nutrients including phosphorus. Tests of its suitability for poultry feeding showed that it compares favorably with sardine meal, familiar as an ingredient of poultry feeds. Though a good souree of protein, starfish meal gave best results when fed in rather small quantities. Too large an amount supplies an excess of culeium. On the basis of these tests, the investigators advise poultrymen to limit this meal to 3.5 to 5 percent of the diet. Even this limited proportion supplies ehicks with considerable protein and calcium enough for their needs.

South Welcomes New Legume: As a cover erop to hold the soil during winter and to inerease its fertility, blue lupine has made a tremendous hit with peanut producers in Georgia, Alabama, and Florida. During the war more peanuts were needed for food and oil. This plaeed a heavy burden on the highly erodible, sandy soils of the Peanut Belt. Alarmed at the possibility of severe land damage, farmers asked the Soil Conservation Service to help them find a suitable winter cover crop to follow the peanut harvest. Blue lupine was the answer. Used as a soil builder in eentral European countries for more than two centuries, blue lupine is now flourishing in southern United States. It grows well on soils of low fertility and produces an abundant seed crop. Blue lupine, like many other legumes, has root nodules that extract nitrogen from the air and improve the soil when the lupine is plowed under in the spring. The plant's drawbaek is that it has an alkaloid poisonous to most livestock. Farmers of Georgia, Alabama, and Florida harvested an estimated 50 million pounds of blue lupine seed during 1946 to use for planting in the fall of 1947. Annual seed prodution may reah 100 million pounds in 5 years. In the South's Peanut Belt farmers say blue lupine has come to stay.

Hydrogenation of Lignin and Wood: It has been shown from research at the Forest Products Laboratory of the Forest Service that lignin dissolved in organic solvents or suspended in water can be made to react with hydrogen gas at elevated temperatures and pressures in the presence of various metallic catalysts. Among the products of the reaction are several new cyclic alcohols that had never been previously described in the literature. These show promise as plastic solvents, antiknock agents for motor fuel, and toxic agents. By varying the hydrogenation conditions, phenolic compounds which may findwhich is sometimes associated with use in plastics and complex neutral oils, together with a plasticlike residue, are obtained. Wood waste or chips also can be hydrogenated in aqueous suspension to produce soluble lignin decomposition compounds and a cellulose plup residue. This is a possible new pulping process that will be studied further by the laboratory. Under more severe hydrogenation conditions the cellulose can be converted to glycerine and sugars. In this case the entire wood is converted to liquid products. All these findings are too new to predict their future application now. Most of the data have been obtained in small bombs and in continuous hydrogenation equipment designed for other hydrogenation reaction. Continuous hydrogenation equipment is being built for further work.

New Type Slatted Floor Hay Drier: Mow curing of hay over a barn drier system using forced air has become popular in some sections of the U. S., and is the generally recommended type of drier installation, particularly in the eastern humid regions. It is of the slatted-floor design, devised by agricultural engineers in cooperative research with the Virginia Experiment Station. More than half the drier systems now being installed are estimated to be of this type as well as half the present total of about 2,000. The slatted floor drier is simple in design. It consists of a tapering central air duct open at the sides on the bottom to allow the air to flow to the slatted floor and up through the hay. The slatted floor can be built of rough lumber and laid by inexperienced carpenters, insuring low-cost construction. The experimental tests have shown that duct-pressure losses in driers of this design, properly operated, are less than half those of the conventfonal duct system. Air distribution is better and air flow through the day is increased.

Worth of Farm Business. How much money is the whole U. S. farm business worth? Economists in the Bureau of Agricultural Economics are bringing together their annual balance sheet of agriculture for 1947. Viewed as a composite business, the balanee sheet for last year (January 1, 1946) showed American agrieulture was valued at $101,500,000,000, farm real estate was valued at $56,-584,000.000. other physical assets at $24,888.000,000, and financial assets of farm operators totaled $20,050,-000,000. Owners had an equity in this total amounting to $93,181,000,-000, and creditors had an $8,337.000,-000 claim on these assets. It was estimated that the net shrinkage in value of farm buildings, machinery, and equipment as a result of low maintenance may have been nearly $800,000.000 for the years 1942-45. The total farm mortgage debt declined by $190.000.000 to $5,081,000 during the year 1945. The mortgage debt declined 23 percent between January 1, 1940 and 1946.

New Methods for Quinine Analysis: A simple rapid method of extraeting and determining quinine in cinchona bark has been devised at the Department of Agriculture Experiment Station in Puerto Rico. The method has the advantage of requiring small samples of bark (1 gram) and can be used to determine small amounts of quinine; and quinidine present also is measured as quinine. The method may be particularly useful in evaluating young cinchona seedlings for anti-malarial eonstituents in a breeding and selection program. The method also can be used in assaying samples of cinchona bark for commercial purposes.

Rutin 'Extracted Commercially from Buckwheat Plants: Rutin is a little known flavonal glucoside oecuring in various plants, including tobacco. In work on the industrial utilization of tobacco, the Eastern Regional Research Laboratory of the Bureau of Agricultural and Industrial Chemistry determined the percentage of rutin in different kinds of green and cured tobaeco and developed methods for the extraction of rutin from tobacco and other plants. By these methods the Bureau extracted enough rutin from flue-cured tobacco for cooperative research on biological effeets of rutin by the Bureau of Animal Industry on its therapeutic value by the Medical School of the University of Pennsylvania.

Rutin was found to be nontoxic to laboratory animals and clinieal patients. The clinical tests showed it to be definately effective in treating a pathological condition known as "increased capillary fragility," high blood pressure and causes minute blood vessels or capillaries to rupture—occasionally in the eye or brain with attendant blindness or apoplexy. Most of the patients treated with rutin showed marked improvement, especially where it was combined with remedies for high blood pressure.

Analysis showed that buckwheat is more promising than any other plant examined as a commercial source of rutin. While the percentage of rutin in buckwheat is highest (about 3 percent on dry weight of plant exclusive of roots) when the plant is in bloom and before any seeds are set. the greatest yield per acre is obtained about 3 weeks later when the plants have made their maximum growth and set all their seed. At this time the yield per acre is 3 1-2 to 4 times as great as at the time of highest concentration in the plant. Most of the rutin is in the leaves. very little is in the stems, and none is in the seed. Much of the rutin is lost when the plants are dried, especially if dried slowly. Under the best drying conditions more than a third of the rutin is lost.

During the summer of 1945 about 300 pounds of rutin were extracted from green buckwheat plants by 4 drug manufacturers with technical guidance by chemists of the laboratory. This rutin was used by the firms' research staffs and supplied in tablet or capsule form to interested physicians for experimental use.

Approximately 12 pharmaceutical companies planned to manufaeture rutin during the 1946 season, with an indicated production of from 10,000 to 20,000 pounds. This quantity is sufficient to treat 200,-000 to 400,000 eases for a full year. The higher production figure (20,-000 pounds) would require about 4,500 tons of fresh buckwheat plants or an equivalent quantity of dried buckwheat leaf meal.

Better Milk Yields by Housing Cows in Pen Barns: At the Huntley, Mont., field station of the Bureau of Dairy Industry, where both the conventional type of stanehion barn and the pen-type barn are used for housing milk cows, better milk yield have been obtained from the cows housed in pen barns than from those in stanchion barns. In an experiment to eompare the merits of the two system of handling cows in milk, two comparable groups of cows were used. One group was fed a rather liberal grain ration and the other a limited grain ration, each group being housed first in one type of barn and then in the other. All cows were milked 3 times a day. The 7 eows fed the liberal grain ration produced on the average of 18,402 pounds of milk and 648 pounds of butter-fat (calculated to maturity) when housed in the pen barn. This was 19 percent more milk and 18 percent more butterfat than they produced when kept in the sanehion barn. The 7 cows fed the limited grain ration produced on the average 14,319 pounds of milk and 501 pounds of butterfat (calculated to maturity) when housed in the pen barn. This was 8 percent more milk and 6 pereent more butterfat than they produced when kept in the stanchion barn.

Each system has advantages and disadvantages. which vary with local conditions. The pen barn, or loafing barn as it is sometimes called, often consists of an open shed that ean be partly or completely closed against severe weather. The cows run loose and get their roughage from mangers or racks inside the barn or outside in the lots. They are milked and fed grain in a separate milking barn. The stanchion barn has a eoncrete floor and the cows are always confined by rigid stanehions, even while being fed and milked, although they may exercise in an open lot when the weather permits. The pen-barn floor is of earth, and the manure and bedding are allowed to accumulate. The manure can be removed once or twice a year, whereas manure must be removed daily from the stanchion barn. The pen barn requires considerably more bedding, however, and this is an important disadvantage if bedding is scaree or expensive. The cows unquestionably are more comfortable in the pen-type barn, and this probably was the reason for the higher milk production in the pen barn in the Huntley experiment.

Laminated Paper Plastics Containing Lignin: New lignin plastics evolved by the Forest Products Laboratory of the Forest Service and commercial cooperators, and now in commercial production, give strong promise of providing a quantity outlet for much lignin wasted annually by many pulp mills. The plastic consists of paper filled with lignin, which serves as the bonding agent in place of more expensive synthetic resins. For many electrical and decorative applications, it has been found equal to, or better than, more costly plastics.

Scientific Apple Storage: More Pacific Northwest apples in prime condition are being available at eastern markets throughout late winter and spring, as growers increasingly adopt handling and storage recommendtions of specialists of the Bureau of Plant Industry, Soils, and Agricultural Engineering and the Farm Credit Administration. These recommendations involve a new principle called "reversed air" cooling. Apples of the Delicious variety are particularly sensitive to storage conditions. Research has shown, however. that ripening can be retarded and storage life lengthened by rapid reduction of fruit temperature to 30 degrees 32 degrees F. Growers following the new practices can make the most effective use of refrigeration.

The new designs and installation specifications for cold-storage houses aim at faster and more uniform fruit cooling by forced circulation of refrigerated air. Large quantities of air, and delivery and return ducts spaced as far apart as possible, increase air velocity and hasten cooling. Reversed air cooling provides for input of cold air or removal of warmed air through the same ducts. Reversal of the air movement at regular intervals, usually about 3 hours, makes possible the use of eolder air from rapid precooling without danger of freezing, as none of the fruit is exposed continuously to the ineoming cold air.

Fruit is harvested at optimum maturity and sorted into blocks for early, middle, and late shipment, so that preferential treatment can be given apples to be held longest. The best fruit is put in storage at once, preferably the morning after picking when the night air has removed some of the heat. It should reach storage temperature within a week and be kept there until shipped to market under refrigeration. Apples for late fall or midwinter sale have second place in the eooling schedule. They are brought down to storage temperature less rapidly, but get additional refrigeration later as it can be spared from the late-shipment block BPISAE speeialists reeommend that the part of the apple crop of lowest storage quality be packed as received from the orchard and shipped early with little or no cooling in storage.

Plywood Adhesive from Soybean Meal or Corn Gluten: A new waterproof plywood adhesive having eonsiderable binding strength has been developed by the Northern Reginonal Research Laboratory of the Bureau of Agricultural and Industrial Chemistry. It is made by combining solvent-extracted soybean meal freed of its water-soluble constituents, or lorn gluten, with phenolie resin in the intermediate or water-soluble form. A commercial trial demonstrated that excellent plywood could be fabricated with such a glue, which becomes insoluble on setting. A plywood manufacturer made praetical use of this discovery and has consumed large quantities of a commercial brand of soybean meal in making waterproof plywood. A manufacturer of soybean meal offered to supply a large amount of the proper quality to companies interested in the use of a soybean-modified, phenolic-resin plywood adhesive. So prospects are good for increased industrial utilization of soybean meal in adhesives. Since the new adhesive costs less than other waterproof adhesives and results in plywood suitable for use as such, or as concrete-pouring forms in building houses and other structures, it should help to reduee construction costs on farms and elsewhere.

New Storage for Potatoes: Potatoes may taste better later in the season, thanks to a new type of storage house developed by engineers of the Bureau of Plant Industry, Soils, and Agricultural Engineering in cooperation with several State experiment stations. The house enables cool air to circulate under and around the potato bins instead of through the mass of potatoes, a method known as shell eooling. The high relative humidity in the bins helps lesson shrinkage and deterioration, but the air outside the bins has somewhat lower relative humidity which reduces damage to the structure. Shrinkage losses of the 10 million bushels of late-crop potatoes now stored each year in improved storages of this type in the U. S. are 1 to 10 percent less than in other types. Shell cooling and other improvements in storage houses are being widely adopted in Maine, Michigan, North Dakota, Nebraska and Colorado.

Nightshade Berries Removed from Canning Peas: Nightshade is a troublesome weed in the commercial pea-growing areas of Oregon and Washington, where about one-fourth of the Nation's supply of canned peas is packed. Its immature berries, which closely resemble peas sometimes contaminate mechanically harvested shelled peas because they are not removed by the usual cleaning equipment. A simple, inexpensive method for removing the berries and other foreign material from mechanically shelled green peas has been developed by the Bureau of Agricultural and Industrial Chemistry's Fruit and Vegetable Products Laboratory, Pullman, Wash., in cooperation with the Washington Agricultural Experiment Station and commercial pea canners. This new process is based on the difference in the wetability of shelled peas and nightshade berries.

This difference is enhanced by applying a very small quantity of mineral oil in a preliminary treatment, after which the peas are fed mechanically into the top of a tank containing a foaming emulsion. Properly handled, this mixture permits the nightshade berries, other weed seeds and debris to float away while the peas settle to the bottom of the tank where they may be drawn off. Most of the oil is removed from the peas by rinsing, and all but a minute trace is removed in the usual blanching operation before canning. During the 1946 season the cleaning process was in large-scale commercial use at 4 eanneries that had installed "in line" machines eapable of cleaning from 2 to 4 tons of shelled peas per hour.

High-Frequency Heat for Gluing Wood Products: Methods and equipment for using radio-frequeney heating to set glues in wood products have been developed by the Forest Products Laboratory of the Forest Service. It has been demonstrated that high-frequency dielectrie heating can be employed advantageously in the mass produetion ofi artieles which require the use of expensive jigs and other apparatus. The rapidity with which the glue is set—in seconds rather than hours—enables manufacturers to use such apparatus at a much faster rate, thus cutting unit costs of their products. High-frequency heat appears to hold especially great promise in furniture manufacture and production of laminated timbers for land structures and ships.

Master Sample: The Bureau of Agricultural Economics, in cooperation with the Bureau of the Census, has eompleted the drawing of a "Master Sample" of farms, which is in effect a small replica of all the farms in the United States. Every county containing agricultural enterprises is represented. The sample consists of about 67,000 small sample areas which average about 2.5 square miles in size and eontains an average of about 5 farms eaeh. One of the pirncipal features of the Master Sample is its adaptability to various needs. The number of sample areas to be enumerated for any survey may vary widely, depending on the type of survey, the universe to be covered, and the accuraey desired. The sample can be used not only for Nation-wide studies, but for regional, State, or special crop-area studies as well. A further advantage of this sample over other sampling designs is that in clustering the units of observation (farms) by sample areas, eonsiderable savings in survey costs are effected through reduction in travel between farms. This results in a great increase in sampling efficiency per dollar spent.

The first large-scale use of the Master Sample was in connection with the 1945 eensus of agriculture. It has also been used in eonneetion with field surveys by BAE as well as by other ageneies, and materials are being made available to State agricultural experiment stations in connection with their surveys. The materials assembled in the drawing of the sample are very useful and will save much in costs of future samples. These materials consist of: (1) Large-seale highway maps of

all counties in the U. S., with information on them useful for sampling; (2) listing sheets showing all villages, towns, and cities having an estimated population of 100 or more; (3) tabulations of farms and dwellings by small geographic areas; (4) transparent "positive" county maps from which an unlimited number of county maps showing the sample areas can be reproduced by the ozalid process; and (5) aerial photographs covering over 90 percent of the sample areas. If additional sample areas are needed for any county or group of counties, these can be readily provided at relatively small cost.

Phenothiazine as Anthelmintic: Phenothiazine is a synthetic organic chemical first prepared in the latter part of the nineteenth century. It is one of the thiazine dyes. Following the discovery and announcement that phenothiazine was effective as an insecticide its value as an anthelmintic was studied and established in 1938-39 by Harwood, Jerstad, and Swanson, workers of the Bureau of Animal Industry. Experimentation with this drug has been continued to develop the best methods of use. Phenothiazine is now widely recognized throughout the world as a highly effective anthelmintic for the removal of many injurious internal parasites of domestic animals. It is the most valuable single drug so far discovered for combating such parasites. The drug is distributed commercially in powder form and may be administered either in gelatin capsules, in ground feed, in salt, or as a drench, the choice depending usually on the species of animals and preferred method of handling them. For use as an anthelmintic, phenothiazine should be the pure product prepared especially for that purpose.

In 1-ounce doses phenothiazine rids sheep and goats of stomach worms, nodular worms, hookworms, and related pests. Its use prevents the spoiling of the sheep's intestines by nodular worms, thus providing an additional war material for making surgical sutures when they were greatly needed. In suitable doses which vary with the size of animals, phenothiazine is effective in removing several kinds of parasites from swin, cattle, horses, and mules. In very small doses this drug is effective also in removing cecal worms from poultry. These worms transmit blackhead to chickens and turkeys. The extensive use that phenothiazine already has acquired for controlling animal parasites is evident from the quantity—about 3 million pounds—used in the United States in 1944. Recently a mixture of 9 parts salt and 1 part phenothiazine, when made available to sheep, has been found largely to prevent acquisition of the parasite.

Insecticide Dispersing Equipment: Recent development of the more effective insecticides, such as DDT, has made it necessary to develop equipment to disperse these materials properly and economically. As early as 1928 the Bureau of Entomology and Plant Quarantine studied methods for the proper dispersal and adherence of concentrated conventional sprays. Spray mixtures were applied in atomized form so as to get effective coverage with a small volume of liquid. Insecticide formulations tried were 100 times more concentrated than conventional insecticides then in common use. These sprays were applied with various known types of spraying equipment. Considerable information was obtained on atomizing principles, particle size, and adherence.

The Bureau, in cooperation with industry, has recently tested models of power blowers designed to disperse the new insecticides in finely atomized forms. Different types of nozzle assemblies have been developed for atomizing liquid insecticides and for introducing dusts and liquid, either alone or in combination, into air blases. Tallest shade trees can be effectively covered by this method. Much less spray material is used by this method than by the conventional type equipment used for applying dilute liquid insecticides. The new mist blowers are especially well adapted for treatment of shade and roadside trees and orchards.

Photoperiodism: While working with Maryland Mammoth tobacco prior to 1920, W. W. Garner and H. A. Allard, of the then Bureau of Plant Industry (now Bureau of Plant Industry, Soils, and Agricultural Engineering), discovered that the plants flower only when the daily period of illumination is relatively short—that is, when the days are short and the nights long. When the light periods are long, the plants remain vegetative. Subsequent experiments on many kinds of plans showed clearly that they differ greatly in growth and flowering, responding with respect to the relative length of the daily periods of illumination and darkness to which they are exposed, some conforming to the behavior of Mammoth tobacco, others responding to relatively long illumination periods and stil others being but little affected.

This discovery departed widely from the prevalent theory that mere intensity of illumination was the principal light factor in determining the characteristic growth flowering and fruiting of plants. It had great fundamental importance as pure research, and as it developed widespread practical significance. Response to relative length of day and night largely explains changes in behavior where plants are carried from one latitude to another. It is now possible, by conducting experiments under controlled conditions, to tell in advance whether certain varieties of soybeans, peas, onions, timothy, barley, and other pplants are adapted to the photoperiodic conditions prevailing in specific localities. Experimental crops can be grown under the greenhouse conditions anyway, with supplemental artificial light as needed; if none is adapted to the locality, one or more suitable lines can be bred.

This discovery also has been particularly helpful in selecting soybean varieties that thrive and produce abundant seed for making oil, plastics, and food products in various localities. It enables us to produce our own beet seed domestically instead of importing it as formerly. It enables us to select localities where pyrethrum, a long-day plant, will thrive in the United States, and also to cross plant varieties which would not normally flower at the same time, as in the case of sugarcane varieties. By artificially shortening the daily light period, chrysanthemums and other flowers are now brought to market ahead of their normal season.

Cross-Breeding Experiment with Dairy Cattle: The Bureau of Dairy Industry began this experiment in 1939 at Beltsville (Md.) to explore the cross-breeding of daily cattle. Few experiments in crossing dairy breeds had been conducted before, especially with animals of known producing ability. All foundation animals in the experiment were of known production or transmitting ability. Production-tested cows of four dairy breeds—Holsteins, Jerseys, Guernseys, and Red Danes—were available, as were also proved sires of the same breeds except Guernseys. Funds for the experiment were available through the Bankhead—Jones Act of 1935.

The experiment differs from the usual pattern of cross-breeding, in that only a limited number of interhybrid matings are being tried. The major plan calls for continuous introduction of new genes (units of inheritance) through the use of proved sires of thhe respective breeds. Females resulting from the mating of two breeds are being mated to a proved sire of a third breed. The resulting 3-breed females so far have been mated to a proved sire of one of the same breeds as in the first cross, for a second round of the three breeds involved. All cows are milked 3 times a day for 365 days, and bred 4 1-2 months after calving. No culling is practiced and all females are tested for production.

Thirty-two females representing various combinations of the two breeds have completed production records, averaging 12,842 pounds of milk and 592 pounds of butterfat, at the average of 2 years 2 months. The great majority of these 32 cross-bred heifers are better producers than their dams. Some increase was expected because of the high level of production inheritance transmitted estimated by careful analysis of increase, however, turned out to be approximately 20 percent more (on the average) than was expected. This may be the result of hybrid vigor.

Four 3-breed heifers have completed production records, averaging 14,837 pounds of milk and 654 pounds of butterfat, at the average age of 1 year 11 months. So far every 3-breed heifer is better than her 2-breed dam. One of the striking characteristics shown by all the cross bred heifers is their persistency in milk production. In many cases the monthly butterfat production varies less than 10 pounds fromthe high to the low month.

Copper and Manganese Reserves in Young Animals: Observations have recently been made at the U. S. Plant, Soil and Nutrition Laboratory at Ithaca, N. Y., on guinea pigs, rabbits, and rats with respect to copper and manganese reserves of the young. Animals are born into the world with a reserve store of copper in their livers. This reserve is usually enough to tide the young over the suckling period in which the intake of copper is inadequate due to the low copper content of milk. Since the copper reserves are depleted during the suckling period, it is necessary in the interest of adequate nutrition to supply some source of available copper during a prolonged period of suckling. As contrasted to copper, the same animals were born with little or no reserves of manganese in their livers. However it appeared that the animals studied obtained enough manganese in the dam's milk to permit manganese to steadily rise in the suckling offspring. Whether or not the dam's milk supplies enough manganese for optimum nutrition of the young remains to be determined.

Cobalt Deficiency in the United States: The U. S. Plant, Soil, and Nutrition Laboratory at Ithaca, N. Y., is making surveys of mineral deficiencies in the U. S. Cobalt deficiency seems to be more widespread than had been previously anticipated. Reports of cobalt deficiency in forage animals have been made from Wisconsin to Maine and along the Coastal Plain to Florida. Deficiency of cobalt in the forage results in a loss of appetite in the animals, some anemia, and a general "wasting away." If the deficiencies are extreme and are not corrected, they result in the eventual death of the animal. The deficiency may be cured by feeding the animal small amounts of cobal salts. Through a study of the various reports, evidence is accumulating that certain types of soils are more apt to be deficient in cobalt than other types. It is hoped that, through a detailed study of the cobalt content of soils and vegetation in various regions, a generalization as to the type of soil and the amount of cobalt necessary to give best growth of animals may be reached. It is possible that in many areas just sufficient cobalt is present to give fair growth of the animals and actual deficiency symptoms are not recognizable. It may be that additional cobalt in these cases would result in better growth and health of the animals, and it is anticipated that careful laboratory studies of the problem will lead to the correction of these marginal deficiencies, as well as the precise demarcation of the areas where acute deficiencies occur.

Vitamin C Content of Tomatoes: Factors which might influence the vitamin C content of tomato fruits have been studied at the U. S. Plant, Soil, and Nutrition Laboratory at Ithaca, N. Y., for a number of years. The results to date indicate that soil fertilization has little or no influence on the amount of this vitamin in ripe tomato fruits, except that the application of large amounts of nitrogenous fertilizers tends to reduce the vitamin C content. On the other hand, the amount of light received by the fruits while they are ripening apparently has a tremendous influence upon their vitamin C content. Regardless of the amount of illumination which the leaves of the plant receive, tomato fruits which ripen in the shade are low in vitamin C. Shading only the fruits is as effective in producing a low vitamin C content as shading the whole plant. Conversely, exposing only the fruits to full sunshine is as effective in producing fruits containing large amounts of vitamin C as exposing the whole plant to full sunshine. The wide variations observed in the vitamin C content of tomato fruits may be largely the result of differing degrees of illumination of the fruits during ripening. Part of the varietal differences may be related to this factor and plant breeders may want to keep this in mind in selecting new tomato varieties. The application of nitrogenous fertilizers may reduce the vitamin C content simply by resulting in greater shading of the fruits.

Tropical Kudzu: In cooperation with the Soil Conservation Service the Department of Agriculture Experiment Station in Puerto Rico has been working on new legumes for the Western Hemisphere tropics. **Pueraria phaseoloides,** locally named tropical kudzu, appears to have all the favorable points which have made kudsu so popular in the Southern States. Ordinary kudzu will not thrive in the tropics, but tropical kudza, its close relative, thrives well and produces a heavy forage crop. It serves excellently as a soil-erosion plant, and will control erosion on steep hillsides and deep gullies. The protein content of the leaves is high, and the plant is palatable to animals. It grows well together with other grasses, thus improving the quality of fresh cut feed It has drought resistance, a distinct advantage in Puerto Rico. Interest in this lagume has been widespread, and requests for seed have been received from nearly every tropical country of the Western Hemisphere, as well as from the southernmost areas of the U. S.

Livestock Loss Prevention

By Earl E. Wentzel

At a recent meeting of the New England Federation of Humane Societies, Inc., Mr. Earl Wentzel, Field Representative of the New England Livestock Loss Prevention Association, presented an excellent paper, the highlights of which we give below.—Editor.

Loss prevention does not stop at eliminating bruises and reducing losses in transit. Every attempt is made to assist the stockmen in getting the best out of their herds. One of the main fights is against parasites which eat into the vital tissues and bore through the hides to cause damage naturally, estimated at over fifty million dollars yearly.

Here in New England our main effort necessarily has been utilized at the stockyards and abattoirs. When inspections reveal that repairs are in order for the protection of livestock, they are requested. provision of feed and water is also covered by inspections as is handling of the stock, both by yardmen and the public who use the yards.

The matter of handling is one of the things that needs most immediate attention. Unfortunately the small stockyards will remain about as they are with improvements only when it means an economy in operating expenditure. Slaughtering establishments are usually more amenable to improvements, especially when they can see that it will pay off in dollars. Therefore, with our capacity for reconstructing the stockyards at a minimum, if we can show a reasonable effect in improvement of handling, we shall have gone a long way in livestock loss prevention.

Stock cars and trucks are under continual inspection for hazards such as nails, uprights, and splintered boards. Railroads and truckers have been cooperative in seeing that corrections are made when necessary. Partitions in mixed loads are also of prime importance and it is essential that they be in good repair.

A brief tour of inspection of the auction markets in southern Vermont showed that these auctions leave much to be desired, although these seems to be no infringement of the law. We noticed that although some effort is made to feed the "bobbed" calves that come to market, some of these animals would go without food were it not for the efforts of the local humane agents.

Loading facilities at various points were showed to be in good repair. At Rutland, Vermont, during the inspection, we observed the loading out of cattle and calves. The calves were loaded quite comfortably in a separate car, with twenty-five head of cattle in the other car. Following this shipment through to Boston, we found that the calves came through without loss, but there were two cattle dead and one downer that had to be destroyed. Preloading conditions accounted for two of the deaths and it was felt that the wiser course would have been to dispose of them at a local slaughter house.

An educational program must be considered of prime importance. Through education we shall progress most rapidly and substantially. It is just as important, too, to reach the farmer as it is the truck driver, and so it is that our educational exhibit travels to state fairs. This year a new exhibit is planned —a panorama type of exhibit emphasizing the livestock losses occur everywhere along the line from the farm to the packing house. An added attraction will be a revolving centerpiece on which our model bruised meat specimens will be mounted.

Little "Fat" in Retailing

Just how much "fat" is there in the retail merchandising business —that is, the difference between what merchants must pay for the supplies on their shelves and the price they charge their customers?

Unless you're an unusually well-informed consumer, you'll be astonished to learn how small the "fat" is. For example, one of the country's principal food chain systems recently reported that when consumers spent $1.00 in its stores they actually got 86 cents worth of food, figured on the wholesale cost. The remainder—fourteen cents—is all the system retains to pay wages, taxes, rent and all the hundreds of other expenses incidental of running its business, including an extremely small profit on each sale.

It is obvious that all kinds of stores cannot operate on an equally small margin. Volume of business, special services rendered, the kind of goods sold, and many other factors regulate the amount of "fat" a store must have. But it is a fact that ninety-nine stores out of a hundred are operating on as small a margin as possible. The hundredth store, whose management is out to gouge the consumer and charge all the traffic will bear, isn't long for this world—consumer resistance and competition will see to that.

Bear this in mind next time you are tempted to blame the shopkeeper for high prices. He dislikes them as much as you do—he is well aware that the system of mass production and mass distribution which distinguishes America from other nations is based upon keeping prices within the reach of all. He has voluntarily absorbed many higher costs and reduced his profits in an attempt to alleviate the inflationary spiral. But he can't do the impossible—which means that he can't operate at a loss.

Fire Is Always Imminent

Summer and early fall present special seasonal fire hazards which are of particular concern in small towns, forests, and agricultural areas.

Carelessness in the forests has destroyed millions of acres of magnificent timber — and has robbed the country of beautiful vacation spots. Under certain conditions, living trees become literally explosive. A large proportion of forest fires are the sole and direct result of carelessness on the part of campers, hunters and fishermen. The most extreme care must be taken in disposing of cigarette butts, matches and other inflammables. They must never be thrown from cars. And, when you are through with a campfire, take every precaution to make sure it is out. Soak it with water, then bury it in dirt.

In towns, grass fires are a constant source of trouble—and some of them have led to conflagrations. Every community should have and enforce a law requiring property-owners to keep grass cut and every property-owner should cooperate wholeheartedly. His welfare—and perhaps his life—is at stake.

On the farm, constant vigilance is the price of fire safety. Wide firebreaks should be ploughed around grain fields and haystacks. Barns and houses should be free of rubbish. Every care should be taken with gasoline and other burnable liquids. Most farms are far from fire departments and when a serious fire breaks out, heavy loss is inevitable.

The only way to lick fire is to work on the proposition that it is always imminent—and to act accordingly.

WOMAN'S PAGE

Helpful Hints to the Housewife

FALL FASHIONS BRING NEW FEMININE SILHOUETTE

There will be a new feminine silhouette abroad in the land this fall and winter, predicts the American Wool Council after casting an interested eye upon the new fashions now being unveiled in the New York style market. These new fashions now being paraded before hordes of eager and enthusiastic buyers have taken the stuffing out of shoulders, hidden the American kneecap beneath five inches or more of skirt, and sheathed the arms in less bulky lines. Altogether, comments the Council, the little woman of 1948 will be a slimmer, shaplier girl, with suit, coat and dress of modest but elegant mien, with shoes that close at the toes and fit around the heel at the back. Hats, always unpredictable, are expanding in size to balance or dwarf the new natural shoulders and the skirt which now covers delicately the long-exposed faminine knee.

Coats are, naturally, longer following the skirt lengths downward. The fitted versions of unpadded shoulders have main-tailored or raglan sleeves. The loose coats flare in the back with a pleat of fabric hanging in graceful folds. They shrug on and off the new suits with graceful ease.

More fabric and less padding means softer woolens and worsteds, the Council says. It means also the use of more yards of woolens in each garment, and more intricate tailoring than for many years.

Since the suit, with it new "costume" look, has become the rival of the traditional dress, women are more and more accumulating wardrobes of them. Suits are being designed and shown by dress creators in two-piece versions with lingerie blouses, and by suit makers in trim tailored pieces that are slender, pencil like, slightly fitted, with skirts that stop at mid-calf, about 14 inches above the ground.

Phillip Mangone, dean of American stylists, says women won't be able to resist the new fashions because: "They are so new; they are so different."

TIP TO PICKNICKERS

To carry deviled eggs on a picnic without mashing them, fit the two filled halves together, wrap them in waxed paper, and place them in an egg carton.

A pan of water placed in the oven when sweet potatoes are baking will shorten the baking time almost by half, and the potato skins will not be so dry and thick.

"Hemming" has a place in the farm home, and "hawing" is all right in the field; but the two don't go together in sound farm planning.

When heating milk, have the pan covered The cover keeps the milk dark while heating and this helps save riboflavin, the important B vitamin in milk.

Sunshine is the best treatment for restoring fluffiness to flattened feathers. Cheese cloth bags are best for sun-fluffing feathers, advise U. S. Deartment of Agriculture specialists, because the open weave lets in sun and air, and lets out dust and broken bits of feathers.

As canning season progresses, housewives are reminded that the shortest possible time should elapse between gathering vegetables and canning them. It's also well to remember that vegetables should be gathered and canned at just the right age to make good canned products.

At the present time, much cotton material on the market is not pershrunk. Unless you know positively that material for the new dress has been preshrunk, play safe and shrink before making, advises Levice Ellis, AP extension clothing specialist.

For Better Eggs

In summer it's important to gather eggs in a wire basket at least three times a day. Cool eggs as quickly as possible to around 50 degrees, suggested John Ivey, API extension poultryman.

FOOD VALUE OF OATMEAL

Oatmeal contains culcium and iron; the B vitamin thiamine; about 60 calories to a half cup serving, for bodily energy; and portein for body tissue building and repair. When a bowl of oatmeal is served with milk or oatmeal is used in cookies containing egg or when oatmeal is blended in a meat loaf, the proteins of the plant and animal foods supplement one another as to essentials the body requires. Even a little protein from an animal source teamed with the grain forms a highly nourishing combination.

BLACKBERRY JAM

4 cups prepared fruit
7 cups sugar
1-2 bottle fruit pectin

To prepare fruit, grind abut 2 quarts fully ripe berries, or crush completely one layer at a time so that each berry is reduced to a pulp.

Measure sugar and prepared fruit into large saucepan and mix well. Bring to a full rolling boil over hottest fire. Stir constantly before and while boiling. Boil hard 1 minute. Remove from fire and stir in bottled fruit pectin. Then stir and skim by turns for 5 minutes to cool slightly, to precent floating fruit. Pour quickly. Parafin hot jam at once. Makes about 10 six-ounce glasses.

ORANGE-PINEAPPLE SPONGE ROLL

3-4 teaspoon baking powder
1-4 teaspoon salt
4 eggs
3-4 cup sugar
3-4 cup sifted cake flour
1 3-4 cups Orange Pineapple Filling

Combine baking powder, salt, and eggs in bowl. Place over smaller bowl of hot water and beat with rotary egg beater, adding sugar gradually until mixture becomes very thick and light-colored. Remove bowl from hot water. Fold in flour, a small amount at a time, and vanilla. Turn into greased pan, 15x10x1 inches, lined with greased paper to within 1-2 inch of edge Bake in hot oven (400 degrees) 13 minutes. Quickly cut off crisp edges of cake. Turn from pan at once onto cloth covered with powdered sugar. Remove paper. Spread with Orange Pineapple Filling, spreading almost to edge. Roll quickly. Wrap in colth and cool on rack. Makes 10 to 12 servings.

Orange Pineapple Filling

5 tablespoons cornstarch
1 cup sugar
1-4 teaspoon salt
1-4 cup water
1-2 cup orange juice
3 tablesoons lemon juice
1 egg, slightly beaten
2 teasoons butter or margarine
2 teaspoons granted orange rind
1 cup drained diced pineapple

Mix together cornstarch, sugar and salt. Combine water, orange juice and lemon juice. Add liquid gradually to dry ingredients. Cook over medium heat, stirring constantly until sauce thickens. Heat to boiling temperature and cook 2 minutes. Remove from heat. Add small amount of hot liquid to egg, stirring constantly; then pour back into remaining hot mixture while beating vigorously. Continue cooking about 2 minutes, stirring constantly. Remove just before spreading filling on cake. Makes about 1 3-4 cups filling.

You can remove those unsightly black marks on linoleum, or other flooring, with a cloth that has been dipped in liquid paste wax.

SCALLOPED PEACHES

1 1-2 cups peaches
3 tablespoons brown sugar
Few grains nutmeg
Few grains salt
Buttered crumbs
3 tablespoons water
Whipped cream

Put a layer of crumbs in bottom of baking dish, cover with peaches which have been peeled and sliced and sprinkled with sugar, nutmeg and salt. Cover with buttered crumbs and with another layer of peaches. Sprinkle with water. Cover with remaining crumbs and bake for 40 minutes at 350 degrees. Cover at first to prevent browning too fast. Serve with peach syrup or whipped cream.

BANANA FROZEN SALAD

To prepare 10 to 12 servings of this cool pot pourri of delectable fruit flavors, add 1 teaspoon of lemon juice and 1 teaspoon salt to 2 tablespoons mayonnaise and stir into 2 three ounce packages of cream cheese. Add 2 teaspoons crushed pineapple, 1-2 cup maraschino cherries, cut into quarters, and 1-2 cup chopped nutmeats. Fold in 1 cup of whipped cream. Add 3 ripe bananas cut into cubes. Put into trays and place in refrigerator. Freeze until firm garnish with crisp salad greens.

Sauerkraut is good the year round. It may be featured in various ways—chilled in salads, or served hot with fish or meat dishes. This good, wholesome food, which takes little or no time to prepare, is flavored enough to use as a relish or a vegetable.

JUICE USE

Tomato juice can replace tomatoes successfully in a soup, sauce or baked dish, provided large pieces of tomato are not important to the looks and flavor of the food when served. Be careful about further seasoning when making this substitution as commercially canned juices often contains spices as well as salt.

TOMATO SHERBET IS PIQUANT SIDE DISH

As an accompaniment for beef, ham, lamb fish, or chicken, few side dishes equal piquant tomato sherbert. To make 3 cups combine 1 eleven-ounce can of condensed tomato soup, diluted with an equal quantity of water, 1-3 cup white corn syrup, 3 whole all-spice and 1-2 inch piece of stick cinnamon. Simmer 5 minutes. Strain out spices. Add 1-4 cup lemon juice. Pour into freezing traps of refrigerator. When partially frozen, remove sherbet to a cold bowl and beat with a rotary beater until fluffy. Return quickly to cold tray. Freeze until firm.

It is not necessary to remove the skin of mushrooms Just wash and slice them. However, if they are to be kept in the refrigerator for any appreciable length of time before using, do not wash them, as it will discolor the caps.

COOKING ANACHRONISM

"Boiled" ham is not boiled by good cooks today. Neither are "boiled" eggs boiled, nor is "boiled" fish cooked by this method. Instead, these protein foods are simmered—that is, cooked in water just below the boiling point. Home economists of the U. S. Department of Agriculture explain that the high heat of boiling toughens protein greater tenderness results from cooking longer at a lower temperature.

The common use of "boiled" for these foods is simply a case of an old term that has lagged behind modern cooking knowledge and techniques. Home economists suggest that if cookbooks would adopt new names as cooking methods change, this would call the attention of housewives to better ways of cooking.

LEMON-PINEAPPLE CUSTARD

1-2 cup sugar
2 tablespoons flour
4 cups milk
4 eggs
1-2 teaspoon salt
2 tablespoons lemon juice
2 teaspoons grated lemon rind
1 cup crushed, drained pineapple

Combine sugar and flour. Heat milk to scalding and add to well-beaten egg yolks, salt, lemon juice, and lemon rind. Add this mixture to mixed sugar and flour, stirring to blend. Beat whites until stiff and dry. Pour hot mixture into stiffly beaten whites and blend. Add heaping tablespoon of pineapple to each of six to eight custard cups. Place in a pan of warm water and bake in a slow oven, 325 degrees, for 45 minutes or until a clean knife inserted in the center comes out clean. Serve with cream. Serves 6 to 8.

A superlative dressing for that favorite steak is made by adding a few drops of Worcestershire sauce to creamed Roquefort or Blue cheese. Spread on the sizzling hot steaks just before serving.

FRESH PEACH SOUFFLE

3 cups sliced peaches
1-4 cup butter or margarine
1-4 cup sour cream
1-2 teaspoon bitter almond extract
Juice of one lemon
1-2 cup sugar
2 tablespoons flour
4 eggs

Melt shortening in a skillet. Add the sliced peaches and heat through Then add the sour cream, almond extract, lemon and the beaten yolks of the 4 eggs. Cook over low beat until mixture thickens; then add to the stiffly-beaten egg whites. Pour into a well-greased baking dish. Bake 325 degrees for 45 minutes or until firm. Serve with whipped cream.

BANANA ICE CREAM

1 cup mashed fully ripe bananas
2 teaspoons lemon juice
1-4 cup sugar
1-4 teaspoon salt
1-3 cup milk
2 egg whites
1 cup whipping cream or evaporated milk
2 egg yolks
1 teaspoon vanilla extract

Mix together bananas and lemon juice. Add sugar, salt and milk, stirring until mixed. Beat egg whites until stiff. Whip cream until thick and shiny but not stiff. Beat egg yolks until thick. Combine banana mixture, egg whites, egg yolks, cream and vanilla. Turn into freezing trays of automatic refrigerator. Freeze, with indicator at coldest setting, stirring every 30 minutes, until mixture begins to hold its shape. Freeze until firm. Eight servings.

EASY ON THE KNEES

Fill a discarded purse with straw or crushed newspaper and use it as a kneeling pad when washing the floor or woodwork.

TO FREEZE PEACHES

Choose soft ripe peaches. Wash then peel fruit. This may be done with a knife or may be accomplished more rapidly by immersing the fruit in boiling water for a minute, then rapidly cooling it in running cold water and rubbing off the peels The peeled fruit should be sliced or cut in halves and pitted.

Put the slices or halves directly into the containers in which the fruit is to be frozen, allowing three-fourths inch headspace, then add enough heavy syrup to cover. One-half cup of syrup should be used on each pint package of sliced peaches and about seven-eighths cup on each pint of peach halves. Place a piece of crumped waxed paper on moisture-proof cellophane on top, then put cover in place. Mark container. Freeze promptly and quickly.

Give an unusual "finish" to veal chops by dredging them with crushed corn flakes or corn meal. Brown well, cover and cook until tender. Serve with sour cream gravy

BREAD AND BUTTER PICKLES

12 cucumbers
4 onions
1-4 cup salt
2 cups vinegar
1 cup sugar
1 tablespoon each mustard seed and celery seed
1 teaspoon turmeric

Soak cucumbers in cold water overnight. Cut unpealed cucumbers into very thick slices. Siver onion lengthwise. Cover cucumbers and onions with salt. Let stand 1 hour. Rinse quickly with cold water, drain. Heat vinegar with sugar, mustard seed, celery seed, ginger and turmeric to boiling point. Add cucumbers and onions. Quickly return to boiling point boil exactly 3 minutes. Pack immediately into 6 sterlized pint jars; fasten closures at once.

Never use glass jars that leak for presure or water-bath canning. But don't throw them away either. Save them for jams and jellies, pickles and relishes or to use as refrigerator cotainers.

TOMATO SANDWICH SALAD

Part 1

1 envelope plain gelatin
1-4 cup cold water
2 cups canned or fresh tomatoes
1 tablespoon horseradish
1 teaspoon salt
1 tablespoon onion juice

Soften gelatin in cold water and dissolve over hot water. Combine tomatoes, horseradish, salt and onion junce. Add dissolved gelatin to this mixture strain, fill shallow pan 1-3 full of tomato jelly and chill until firm.

Part 2

1-2 envelope plain gelatin
2 tablespoon cold water
1 cup mayonnaise or 1-2 cup mayonnaise and 1-2 cup cottage cheese.

Soften gelatin in cold water and dissolve over hot water. Add dissolved gelatin to mayonnaise, or mayonnaise and cottage cheese mixed, stirring thoroughly. Spread this layer over the firm tomato jelly layer in pan. Allow to congeal and then fill pan with remaining tomato jelly. Chill until firm. To serve, unmold on platter, garnish with salad greens. Slice to serve. 6 servings.

Process cheese is the name applied to all reworked cheese.

More for the Money

The retail situation seems to be stabilizing to a considerale extent, and merchandising experts are getting a clearer idea of what the consumer is demanding.

First of all, there is a definite accent on better quality. The public is weary of the shoddy goods and the substitutes which had to be sold during and after the war because other goods were unobtainable. Buyers for the large chains and department stores have examined manufacturers' lines with the most meticulous care and have refused to stock sustandard items. This is of benefit to the small merchant as well, in that it forces producers to offer improved lines.

There is consumer resistance to increasing prices. As an example, many stores have reported that expensive women's wear is moving more slowly than in the past. At the same time, the bulk of the consuming public seems to have realized, even though reluctantly, that there is no way to achieve the impossible ideal of 1941 prices coupled with 1947 wages, taxes and other costs. It is only human to want higher pay and lower prices at the same time, but it just doesn't make economic sense.

Retailers of all kinds and in all the basic fields have done an excellent job in serving the consumer under difficult and often unpredictable conditions. They have attacked the price problem with all the weapons they possess, and have been responsible for limiting increases as much as possible. They have improved and broadened their serviees. The American consumer, despite the depreciated dollar, gets more for his money than any other buyer on earth.

THE MODERN FARMER

VOL XX. NASHVILLE, TENN., OCTOBER 15, 1947 No. 9

THE BYRD NEST

By Rev. Bernard O. Byrd
—Guest Columnist.

SOME FINISHING TOUCHES

To everything that is well done, there are some finishing touches. The field of finishing touches is so broad that it touches mother nature as she transforms a tender sprout into a mighty tree, and a tiny bud into a branch bearing fruit. We see it in the growth of fowl and lower animals and also in the lives of human beings. There are finishing touches to be put on clothes, jewelry, furniture and buildings. Education, social adjustments and religious ventures in Christ have their many finishing touches. Surely as God said to Noah, "And thou shalt pitch it within and without with pitch," He was teaching and directing the ancient builder that aside from the rough structural operations, there were some finishing touches.

One of the more disgraceful and reflectory sights to any community is an unfinished building. Men and women are known to resent vigorously the unfinished things of life. Much has been lost by unfinished statements, conversations, educational ventures, pledges of support or loyalty. Many, many persons take matrimonial vows but the ill conditions of society today are due in part to the failure of millions to keep and finish the vows. We have unfinished educational jaunts, unfinished ambitions, unfinished efforts toward religious training, and many unfinished church programs which were started to be developed according to the teachings of the Scriptures.

It is hard to get a man to wear an unfinished suit, a woman to wear an unfinished dress or hat, (though most modern hats look unfinished) or even a child to wear an unfinished costume, but many men and women delight in parading unfinished characters up and down the streets of human observation. From day to day as we walk the streets, we see a number of unfinished lives: Unfinished only because the individuals did not put on the finishing touches. When one meets a man who has had some school training and striving to use it to show himself off or to get personal praise or honor, or to get higher recognition, you can be sure that you are beholding a man or woman whose education was unfinished. When one sees a person dead because of a brawl or strife with some one else, it is almost certain that someone's social adjustment has not been finished.

Many persons would have done much more in finishing their ventures had they known to proceed properly, using the proper materials. God told Noah to finish the ark when he said, "Pitch it within and without." But God also told Noah what to use by pointing out that it should be pitched with PITCH. Perhaps one of the reasons why many persons do not know what to use in finishing their lives and ventures, is that they go to the wrong persons to find out what kind of materials to use. If one is to finish anything rightly, he must take advice from God. Noah could have used clay, but clay would not have stood up against the things which the ark was destined to face or encounter.

Farmer John Jeffries And Wife Grossed $2,800.00 From Tomato Crop

John Jeffries, right, a sharecropper in western Tennessee, grossed $2,800 last year by growing sideline crops with his cotton. He is shown in his tomato patch talking with Extension Service County Agent A. M. Dobbins. Mrs. Jeffries helps with the harvest of the tomato crop. The Jeffries sharecrop 40 acres near Jackson, Tenn.

Side Line Crops Prove Success in West Tennessee

Washington, D. C.—In the cotton area of western Tennessee, colored farmers are rapidly diversifying as a means of adjusting their cropping system to on-coming mechanization and the changing pattern of farming in the South, reports W. H. Williamson, assistant State agent of Extension Service.

Mr. Williamson says that the shifts are to truck crops, poultry, and livestock. He points out that even tenants and sharecroppers have begun growing strawberries, cabbage, and tomatoes as sideline crops. This has made it possible for western Tennessee to increase its carload lot shipment of these products.

As an example of the increased income which even small farmers are deriving from these sideline crops, Assistant State Agent Williamson points to John Jeffries, a sharecropper farming 40 acres near Jackson, Tenn. Last year he added $1,900 to his gross cotton income by growing strawberries, cabbage, tomatoes, and a little sorghum.

Farmer Jeffries says that up until 1939, he, his wife, and two boys had barely broken even depending on cotton to carry the whole farm load. With his boys getting larger and their clothes costing more, besides the extra money that it took for them to attend high school in town, Sharecropper Jeffries got to thinking how he could increase his income.

Then one day he received an announcement in the mail that the county agent was going to hold a result demonstration in strawberry growing in his community. Jeffries had heard of Extension demonstrations all along, but had never attended one. Thought they were like the farm meetings he went to several wears back where everybody got up and bragged about the yields he was getting and the money he was making, but no one took the time to explain how it was done. Maybe a demonstration meeting would be different—anyway, he thought he would attend.

At the demonstration which was

Mechanization of Small Cotton Farms Stressed by Agriculture Official E. D. White

Washington, D. C.,—Mechanized equipment that meets the requirements of small cotton farms is needed, said E. D. White, Assistant to the Secretary of Agriculture, in an address recently before the Cotton Congress in Dallas, Texas.

Emphasizing the need for gearing more farm machinery to the needs of small cotton farmers, While pointed out that over half our cotton acreage is worked by farmers who produce less than 10 bales of cotton.

Continuing, he added, "While mechanization is advancing and gives promise, some phases of it are lagging. More tired hands should be taken off hoe handles and more pick sacks should be taken off aching backs. We must move in this direction."

Pointing out that more mechization is needed throughout all stages

Running Water in Every Farm Home is Goal of One Virginia County

Essex County, Va.—As a result of Extension demonstrations in installing running water in rural homes and on the farm, Essex County, Va., colored farmers have set as their goal, running water in every home and on every farm, reports Ross W. Newsome, State agent.

Recently, an Extension agent installed running water in the home of a farm woman as a demonstration. Before, she had been drawing water from a well 28 feet deep. When the water system was completed, she just sat a long time looking at the faucet right inside her kitchen, then she asked, "Why couldn't I have had this all the time?" Last week, she installed bathroom fixtures and a kitchen sink.

Teacher—"Freddie, your essay on 'My Mother' is exactly the same as your brother's, word for word."

Freddie—"Yes, sir. We have the same mother."

Urges Farmers to Grow Healthier and Better Children for Better Living

Washington, D. C.—"In addition to raising top grade tobacco and fine healthy livestock and poultry, we must also grow a better crop of children," declared T. M. Campbell, Federal Extension field agent, in an address last Thursday before the two-day annual session of the State Negro advisory Board of Virginia, meeting near Richmond.

Campbell's address followed a series of reports made by farm and home delegates from 39 counties. Unlike many previous annual achievement records which emphasized production and dollar-income, this year's reports stressed such end results as farm ownership, soil improvement, home improvement, community welfare, and better rural living.

Other speakers on the propram were Edmund T. DeJarnette, State Representative, Miss Maude E. Wallace, Assistant State Director of Virginia Extension Service. John W. Mitchell, Federal Extension field

Maryland Colored Veterans Tour State Farm To Observe Soil Conservation

Twenty-three Maryland colored veterans, who are taking on-the-job agricultural training in Prince Georges Country, made a tour of the State farm last week to observe methods of increased production through sound soil and water conservation practices.

Under the supervision of District Conservationist M. B. Fussell of Soil Conservation Service, District Extension Agent Martin B. Bailey, and County Agent J. R. Taylor, the tour group covered a large part of the State's 1,200-acre farm at Jessup.

The veterans observed terraces, contour tillage, strip-cropping, and other recommended soil and water conservation practices which are being carried out on the State farm. Highlight of the tour was a short talk by State Conservationist Edward Davis, who told the veterans that 113,000 acres, or nearly 10 percent of the land under cultivation in the State had been treated during last 10 years to help prevent erosion and increase production.

He said that 29,000 acres were plowed on the contour in Maryland last year, and that nearly 16,000 acres were strip-cropped. In urging the veterans to apply sound conservation practices on their farms, Mr. Davis pointed out that on a national average, we have only six inches of top soil left. When the Pilgrims landed, he said, there were

(Continued On Page 4 Col. 1)

State Prison Crop Is One of Largest in Mid-State

Hay Harvesting, small grain seeding, terrace building and other similar jobs was the order of the day on many Tennessee farms during the past week, but it was sorghum making time on hundreds of others. The privately owned and family operated mills could be seen in some instance for several miles as the smoke from the furnaces and steam from the evaporating pans mixed with the crisp, fall morning air.

Following an age-old custom, the mill owner makes up his crop first or at least a portion of it because usually the first few gallons are not as high in quality as that made later on. This is true because the mill as well as the sorghum maker has become "a little rusty" since last season and it takes some time to get everything going.

He then started on the neighbor's crops, some small and some large on a first come, first serve basis, provided the man has his crop and wood on the ground. In some cases, however, a fellow might even borrow a load of wood and replace it later in order to hold his place.

This year's sorgham crop appears good in most places outwardly but is disappointing in some cases. Too much rain or not enough rain are the two reasons given for a short crop. The variety of seed doesn't seem to get much credit either way.

From early morning until late at night those operating the mill are kept busy except for time out to eat and occasional chat with the visiting neighbors. Usually, there are at least a few of these around.

"When do you think you will get to mine, or do you think I have enough wood?"

These are familiar questions asked the operator by the farmer who is allowing his crop to stand as long as possible to prevent it from drying out. The operator will gaze at the rack of cane on which he is working and give the farmer some answer. Sometimes, he gets close to the time and again he might miss it a few days, but that doesn't seem to make much difference in the long run. It is always fun to sit around the mill and be near the furnace if the weather is chilly or under the nearby shade tree when the sun gets hot in the afternoon and guess how many gallons a neighbor's crop will make or watch the fellow feeding the mill duck everytime the mule makes a round. The spectator thinks that surely on the next trip around he will get his head bumped, but that never seems to happen.

Probably one of the largest single crops being processed in Middle Tennessee is that at the State Penitentiary farm. It comprises a little more than 97 acres and although the crop is good, the yield will not average more than 75 gallons per acre. While the yield is above the state average, it would have been large had there not been too much rain during the growing season.

The Warren County crop, which furnishes Nathville's supply of sorghum, is just about average, according to County Agent H. V. Massey.

The 600 to 700 acres of sorghum there will produce in the neighborhood of 45,000 gallons, much of which will remain in the county. However, the remainder will go to market at a price from 40 cents to 75 cents per gallon less than last year when it moved freely at $2.50 to $3.

In Benton County, another large producer of sorghum, the crop is about normal, but the price is off-there also, according to agricultural officials. That county is expected to produce about 500 acres.

The reason given for the price drop is that everyone can purchase all the sugar they want at a price much less than the cost of sorghum, which was used so much for sweetening purposes during sugar rationing.

Although small quantities are reaching the market now, the bulk of the crop will not be ready before mid-October.

Experiment Leads to Profits

Henry W. Foster, left, former Pine Bluf, Ark., high school teacher and football coach, who began raising poultry as a biology experiment, helps his son, Henry, Jr., pack and load eggs into their car for local sales. Last year the poultry farmer sold 4,000 dozen eggs and 15,000 dressed broilers, netting for his labor about $8,000. Looking on is County Agent C. D. McKindra, who gives the poultrymen points on raising and marketing chickens.

Gas-Induced Motherhood Steps Up Tailor-Made Bees

WASHINGTON, (AP)—Agriculture department scientists announced jubilantly last night they are on the trail of a race of super bees.

The scientists said that with the aid of a whiff of anaesthetic gas they can step up the entire process of bee inbreeding. The result—infinitely superior bees.

The virgin queen bee has the unique knack of being able to lay eggs that will produce drone, or male bees, without ever being mated.

But the scientists weren't satisfied. They wanted to be able to breed the virgin queen back to her own sons to produce strains with desirable characteristics.

The hitch was that the virgin queen may not lay eggs for weeks or even months after reaching maturity. Chalk up 24 days more for the drone to develop and the queen was too old to be mated.

Science has changed all that. Given a whiff of anaesthetic and artificially fertilized, the virgin queen will lay eggs almost immediately, leavinv plenty of time for her to be bred to her sons before her productive span is past.

The agricuture department could scarcely suppress its excitement as its disclosed this innovation in the sex life of bees. The gas used was described as a "carbon dioxide anaesthetic."

Self-breeding long has been known in the plant world. It is the principle that mad possible hybrid corn, the corn of phenomenal yields and hardihood that has put millions of dollars of added cash in the pockets of farmers.

Department entomologists foresee that gas-induced motherhood will lead to the production of "tailor-made" bee strains:

The possibility of bee parenthood via gas was discovered about a year ago by a staff or entomologists at the Louisiana State Experiment station. Dr. Otto Mackensen of the Louisiana station, and Dr. W. C. Roberts of the Wisconsin station, have now developed equipment for close inbreeding that is ready for use by the laymen beekeeper.

According to the department, the queen bee normally is not too choosy when she picks a mate. Until artificial insemination of bees was made practical several years ago, it was almost impossible to maintain pure blood lines of bees.

It is through planned parenthood within insect families that scientists develop pure blood lines. They can "pick their genes" and weed out undesirable traits and emphasize desirable characteristics. The gas treatment speeds up this inbreeding.

Campbell Praises Negro Farm Owners

"The Negro landowner is the bone and sinew of the Negro race," declared T. M. Campbell, Federal Extension field agent, in an address last week before 1,000 colored farmers at the Delta Experiment Station, Stoneville, Miss.

"Too many of the children of substantial farm owners are leaving the farm and the good acres," Campbell said. "It is up to us," he continued, "to make the farm home and farm life more attractive."

The veterans field agent, who has been with the U. S. Department of Agriculture since 1906, pointed out that although colored farmers have shown an increase in ownership of about 12,000 farms since 1940, they still have 30,000 fewer farms than they owned 25 years ago.

He stated that in 1920 colored farmers owned 217,589 farms in the South, while whites in the region owned 1,379.636 farms. As of 1945, the whites had increased their holdings by 145,364 farms; their total stood at 1,525,000. But the colored owners had slipped down to only 186,000, a loss of 31,589 farms.

Campbell said that most of these farms were lost because the children of their owners have not remained on the farm to carry on when their parents pass on. He cited poor living conditions as the principal reason for their leaving.

Plan Now

To visit the corn-fertilizer demonstrations in your county. Chances are you will be surprised at the difference in the fertilized and non-fertilized areas.

To make sure livestock is provided with a sufficient amount of water and salt during these hot summer days.

To plant that fall garden before it is too late.

To give the dairy barn another spraying with DDT if flies are beginning to appear.

To save all pigs farrowed this fall. A sloping floor in the farrowing pen will prove very profitable.

To provide sufficient fall pasture for livestock so that a minimum amount of grain will be adequate. In view of the present price of grain, whether you grew it or bought it, it is worth saving.

Holiday Logistics

America is a big country. Her people are chronic travelers. During the summer holidays, family cars by the millions roll from coast to coast.

Recently a driver on a western highway, in a three-hour period, encountered cars from twenty-two states—and he missed identifying a number of "foreign" licenses. Jalopies, hot rods, and limousines, many festooned with trailers, jockeyed for position on the straightaways. Gas, oil and tires were consumed with lavish abundance. No one gave a thought to the next tank of fuel. Service stations were almost as numerous as the leaves on the trees. The shining sedan from New York had only to pull up to the nearest pump for a few seconds and then be on its way again, after filling up with the same type of fuel it used in its home state.

How many of us who drive America's thirty-odd million autos stop to think of the staggering logistical problem which must be solved by strategists in the oil industry who are responsible for keeping us happily on wheels? Supplying a fast moving army is a feat requiring great skill—but think of millions of vacationists using more gas than an army, moving in response to personal whims rather than prearranged orders!

Miraculously, everyone seems to be able to get where they are going. In some manner the gas pumps have been kept full, thanks to the oil men behind the men at the service stations.

Coal for Europe

American coal is a vital instrument of world recovery.

The figures tell the story. Before the war, Europe was able to produce all the coal it needed, and none was bought from this country. Now European production is in the doldrums. Great Britain's mines used to produce close to 4,500,000 tons of coal a week, now they produce slightly more than 3,600,000. The German Rhur once mined more than 10,000,000 tons a month, now it is down to less than 6,000,000. Only the United States can make up the loss.

As a result, our soft coal industry exported 30,000,000 tons, not including Canadian purchases of 20,000,000 tons, during the year which ended June 30. During the current fiscal year, which will end June 30, 1948, the total is expected to reach 50,000,000 tons. That is about 8 per cent of our total output, and the unusual export demand will probably last several years.

Coal is second only to food as an aid to ravaged Europe. Without an adequate supply, it will be impossible to revitalize European industry, maintain employment, and achieve social stability. A modern civilization cannot exist without coal, and coal, consequenty, is at the heart of Europe's economic problem.

Good Supply of Grasses, Seeds Here

By Robert Battle

Most grasses and seeds—in demand by farmers during this season of the year—are available in sufficient quantities to meet the needs of the soil tillers, a survey conducted by the Farm Page revealed

While it is estimated that there is not as much as 200 bushels of certified wheat on the state market, retail dealers in seeds and farming supplies in the Nashville area agree that "good" varities of wheat are plentiful.

With the wheat planting season just getting off to a good start, it is believed that Tennessee planters will raise a large crop this year. The good-grade wheates are retailing on the markets for an average of $3.25.

While certified oat seeds are not as plentiful as they have been at times, there is understood to be a "sizable" amount available. The best varieties, dealers agree, are certified Forked Deer and Ten-X, both of which were brought on the market as a result of tests and experiments at the University of Tennessee in Knoxville.

Forked Deer seed sells for $2.25 per bushel, while the "fairly good" varieties of oats retail from $1 to $1.50 per bushel. Some varieties are still not plentiful as rain caused rottening during the growing season and hurt the harvest. Then, too, it is said that the Kentucky markets are receiving extra large shipments which might otherwise come to Tennessee stores.

Alfalfa seeds—cheaper than they were last year—are selling for 32 cents for Kansas Common to about 25 cents per pound for Argentina Sue. The seed is available in sufficient amounts to satisfy the demands of the farmers, dealers in the field crops and seeds agree.

Barley—on the upgrade as far as price is concerned—can be obtained in fairly large quantities. However, one may find difficulty in purchasing breadless varieties. There is a new kind on the market—known as Smooth-On — which is a slick bearded variety. On the whole, barley is selling for $2.25 per bushel.

The rise in the price of corn on the nation's markets is blamed for the jump in all seed prices, according to an official of Dobson Hicks Seed Company, 110 Second Avenue, North.

Rye grass—used by home owners as a yard grass in addition to its use as a field crop —, is scarce locally due to the shortage of railroad cars needed to transport the seeds to the markets here. It is selling for some 8 1-2 cents per pound.

Most varieties of rye are available in good quantities, but at a higher price than farmers have been paying in the past several seasons. Balboa rye, which sells at $3 per bushel, is said to produce more grain per acre and make more pasture for cattle and other livestock than most other varieties.

It is cheaper than Western rye, imported here from Illinois and Missouri by railway. Balboa is said to be a better grade, and will produce more in an acre of ground.

There is no crimson clover left on the local market, and there is not as many as 10 bags of the seed in the state, a retail dealer said. Most stores have been out of the seed for more than a week.

Both sweet and white clover are plentiful and at higher prices than last year. White clover is selling for about 67 cents per pound, and sweet clover at an average of 18 cents.

The best thing to give to your enemy is forgiveness; to an opponent, tolerance; to a friend, your heart; to your child, a good example; to a father, deference; to your mother, conduct that will make her proud of you; to yourself, respect to all men, charity.

Cotton Picking Time Means Payoff Near for Big Money Crop

MEMPHIS—(AP)— The South's major crop is ready for harvest. It's cotton picking time.

A million and a half cotton farms are scenes of dawn-to-dusk activity. The cottonlands are alive with nimble-fingered men, women and children plucking the white, fluffy bolls. Giant mechanical monsters are busy picking, too.

The payoff for months of hard, anxious work is at hand for the folks of the cotton belt. It means meat and meal for the table, the retirement of a mortgage, perhaps, or money in the bank.

For the rest of the world it means that more white goods for sheets, shirts dresses and diapers are on the way to merchants' shelves.

12,000,000 Bales

A crop of about 12 million bales is expected, about seven million bales less than the record 1937 harvest.

The gentlemen of Memphis' Front street—members of the world's largest spot market—expect the price of the fiber to remain in the upper ranges.

The reasons: the crop is not exactly what one would call "bumper"; the hold-over from the 1946-47 season is only about two and a half million bales; and the world demand is great.

This indicates that a great deal of the crop will be sold somewhere around 30 cents a pound—making it worth about $1,750,000,000.

Last year farmers received an average price of 32.60 cents a pound for their lint. In the 1919-20 season some growers received as much as 43.75 cents a pound while the average price was 35.40 cents.

That year, however, was far different than the big year of foreclosures, failures and hardship that marked the 1931-32 crop. Then the fiber brought an average price of slightly more than five cents.

Cotton grown in the United States — about half of the world's production — comes from lands owned outright, tennant-farmed or share-cropped.

Families Provide Labor

The National Cotton council says more than 68 per cent of the nation's crop is produced on farms that grow only from one to five bales—family unit farms. The remainder comes from the large plan tations and corporation- owned farms—chiefly in the Mississippi delta and on the plains of Texas.

On most farms the family unit provides all labor. But some operators have to turn to other sources. In recent years Mexican laborers have been allowed to enter the country to help. At harvest time, growers frequently call on nearby towns and cities for assistance.

The plant, of tropical origin in prehistoric times, requires 200 frost-free days to develop and mature. As soon as the plantings are about six inches high, the hoe-hands take to the field and begin "chopping" —thining the plants, removing the grasses and weeds. Sometimes mecahnical choppers or flame throwers do part of this work.

This activity fosters the growth of the shrub and discourages the ever-feared boll weevil and other insects. On the large plantations aircraft are pressed into service for "dusting" the fields with insecticides.

In the Rio Grande valley picking begins in August. Along the northern reachces of the belt—Arkansas, Tennessee, Missouri and North Carolina—pickers take to the field in mid-September.

Pickers can take from one to three hundred pounds of the fiber a day by hand. On a day-labor basis, the pay runs from $2 to $3 a 100 pounds.

Agile fingers pluck the protruding fluffy fiber as pickers move down the rows. Filled pick sacks are toted to trucks that shuttle from field to gin.

At the gins, circular saws strip the strands of fiber—the lint—from the sceeds and the fiber is bagged and tied and moved to the compresses where it is pushed into balcs weighing about 500 pounds each.

Meanwhile, the seeds move to the oil mills where the remaining lint is removed, producing linters. Linters—extremely short strands of fiber—are used in the manufacture of rayon, smokeless powder and other products.

Determined by Grade

The seed is pressed to produce oil and meal, providing additional revenue.

After cotton is baled its worth is determined by its grade and staple. The grower can have his cotton graded by a government agency or a private classer.

On the market, quotations are given for cotton classed as white, yellow tinged, gray or yellow stained. Under these headings are classifications such as good ordinary, strict good ordinary, low middling. middling good middling and the like.

Once the grade is established, the classer determines the staple. Dry weather produces short staple fiber; wet weather produces long staples. An expert eye will tell within a 30-second of an inch the length of the strands.

When a planter knows the grade and staple of his cotton— and if he is convinced the time is right for selling — he is ready to start cashing in.

Growers usually sell to neighborhood merchants or to "assembly markets" where the fiber is assembled in 100-bale lots of uniform grades and staples.

Eventually ownership of the cotton falls into the hands of larger merchants—members of cotton exchanges — who operate on "spot" markets where cotton is actually bought and sold as distinguished from the futures markets where trading is in cotton values.

From the spot markets the fiber moves to mill markets or to exporters, and soon is on the way toward being converted into "gray goods" either in this country or elsewhere.

After bleaching it becomes "white goods" and no longer are the white-flecked fields of Dixie in the picture. What happens next is up to the textile industry.

State Milk Production Hits New High

By Robert Battle

Last month 246.000,000 pounds of milk were produced on Tennessee farms—the largest volume of milk ever produced in one month in the state, it was announced today.

S. T. Marsh, agricultural statistician with the State Department of Agriculture, said that the achivement was the result of a record production of 415 pounds of milk per cow.

The number of cows milked during the 30-day period was "fairly large," Marsh continued.

The total production was 235,000,-00 pounds in June, the highest production on record for each of these months, according to Marsh and G. D. Collins, another agricultural statistician.

For the third consecutive year milk production has been high — unusually high most of the month, the officials of the state agriculture department revealed.

Annual Production

In 1946 the average production per cow was tested to be 3,720 pounds. That was the highest for any year for which records have been kept, Marsh said in releasing figures on Tennessee milk industry on the farm.

Records reveal that in 1945 the production of milk per cow stood slightly less, at 3,639 pounds, an annual out-put per cow that had not been exceeded since 1929.

The report on milk, the first to be made on monthly estimates of milk production in Tennessee, showed that there are some 593,000 milk cows on farms in the state, as compared with 563,000 head ten years ago. First, the number of head went on the upward trend, and then dropped slightly, the report revealed. However, the average graded out to what is said to be one of the "outstanding" totals as far as the cow may be classisiefd.

Good Pastures

The high rate of milk production this year and the two proceding ones is the result of unusually good pastures, fairly liberal feeding of grains and other concentrates and the culling of low producers from herds, it was agreed.

While sections of the state have suffered from lack of rain in sections to prevent the pastures from reaching a peak, the dairy animals have had the opportunity to consume more grains and grain products than in many years, officials stated.

With production of many of the feed crops up for 1947 agricultural authorities said today that they felt the next few months would be just as good "if not better" than was last month and the times before it.

The report showed that there seemed to be a tendency among the cattle owners to keep more during the winter months of January and February than any other time during the year. It is at that period of time that the production of milk drops down into the low stages, it was brought out.

If Shade Trees Are Needed, Oaks Are Among the Best

By Dr. Floyd Bralliar,
Garden Editor
The Nashville Tennessean

It will soon be time to set needed shade trees and many people are undecided as to what to plant.

It is with this in view that we are writing this story on oaks.

We have few trees that are as popular as are the oaks. "Strong as an oak' is an expression well deserved. We admire oaks both because of their beauty and exceptional utility. A few varieties of oaks are evergreen, but most of them shed their leaves every year. The evergreen varieties grow only in the South, in California and in Oregon.

The foliage of all oaks is attractive at all times and some varieties color very brilliantly in the fall. In fact, there are a few varieties such as the scarlet oak that are unexcelled for their brilliant autumn coloring. They have the reputation of being slow growers. but our experience is that they grow more rapidly than the average tree; and that they are easily transplanted when they are small.

2 Groups of Oaks

There are two great groups of oaks, the white oaks and the black oaks sometimes called red oaks. The white oaks mature their acorns in one season while the red oaks bloom and set their acorns the first year, carry them over winter as very small acorns and mature them the second year.

If the trees are doing well they usually set acorns every spring, so in the fall both small immature acorns and fully grown ones may be found on the same tree. The white oaks have smooth edges to their leaves no matter how much they are lobed, but there are always bristles on the tips of the lobes of the black oaks, or if the leaves are not lobed there are bristles here and there on the edge of the leaf. Black oaks are usually more desirable for lawn and street planting than are the white oaks. but the wood of the white varieties is more valuable than that of the blacks.

Bitter Acorns

The acorns of the black varieties are very bitter and are unfit for human food while those of the white oaks are far less bitter. and some varieties are eaten freely, and are even made into bread.

Oaks do best in clay soil, even thriving in soil that would be considered poor. Most varieties grow best on well drained soil some will grow in soil that is actually swampy. They thrive better in soil that is fertile than in poor soil, and it pays, when setting oaks on the lawn or as street trees. to dig a hole that is considerably deeper and wider than is necessary to accommodate the roots, and mix plant food in the soil used in filling the hole up to the proper depth to set the tree and also in the soil that fills above the roots. We prefer to not mix fertilizer in the soil that actually comes in contact with the roots. In the mid-South it is best to set trees about the first of December or as early in the spring as the soil can safely be worked though we have set oaks after the middle of June, when the trees were set in full leaf, and they grew right off as though nothing unusual had happened, but we do not recommend this.

Prefer Sour Soil

Most oaks prefer soil that is decidedly sour and for this reason it is not wise to plant them in strongly alkaline soil.

The willow leaf oak is one of the largest of the family, is a native of the South and is almost free from disease. It grows very rapidly, forms a symmetrical tree and makes good shade. It ultimately makes one of the largest trees of any of the oak family, so in setting it out, give it plenty of room.

The scarlet is a native of the South that is decidedly desirable as it thrives in very dry ground. Very few trees of any kind color so brilliantly as do the leaves of this oak. This variety also ultimately makes a large tree and needs plenty of room to display its beauty. It prefers very sour soil, but will grow almost anywhere.

The pin oak is a very popular variety that is recognized by the fact that the limbs grow out of the sides of the trunk at almost an angle of 90 degrees. It grows rapidly, forms a symmetrical tree and colors very brilliantly in the fall. It also soon becomes a large tree and so must have room.

The Southern live oak is one of the very most beautiful of evergreen trees where it is given room to grow and is allowed to shape itself rather than be hampered by man. Unfortunately it is not hardy in most of our territory. Where it is hardy, it should be planted freeely on large lawns and as a street tree in small towns that have wide streets.

ATOM BOMB EXPERIENCE

Two Brethren missionaries. Mr. and Mrs. A. E. T. Oliver, who were in the hands of the Japanese for more than three years, were in Nagasaki when the atomic bomb fell. The interment camp was about two and a half miles from the focal point of the explosion. Describing their experience, Mrs. Oliver says that a light, brighter than the sun, suddenly filled the room. The door fell in, windows were shattered, plaster fell from the walls, and the furniture was displaced. Some of the internees were lifted off the floor: lenses of eye-glasses were smashed and the frames twisted. Mrs. Oliver was unhurt, but her husband's forehead was badly cut, and others suffered cuts and bruises. One curious fact which emerges is that those wearing white were not hurt nearly as much as those in colored clothing; and black printing on advertisements was obliterated, although the surrounding white paper was untouched.—CHRISTIAN.

MUST TEACH WHAT THE BIBLE MEANS BY OUR EXAMPLE

By Joe E. Brown, Actor

The seventeenth annual observance of national Religious Education Week deserves the support of every American. But what is said and done during that week should be remembered and practiced during every week of every year.

It's not enough to be against things, in the world today. We've got to be for something.

We all ask—demand—pray for—"A better world." But that better world can be built and made to work only by better people—whose hearts and minds are filled with spiritual humility and true fellowship and an unchanging faith in high ideals.

The Bible promises "In my Father's house are many mansions." Yet in far too many homes there seems to be no room for God.

Our children must complete the job we're trying to begin. We can't ask or expect them to live by the Bible's teachings unless we teach them what the Bible means—by our own example—while they're growing up. The future is theirs—but the present great responsibility is ours.

A CHILD'S DEVOTION

(A True Incident)

We have recently read of a Christian Jewish family who received a visit from a wealthy Gentile man whom they had formerly known. He brought with him foods of the finest, but as he was a man of the world it was thought best not to ask a blessing upon the meal. But when everyone was seated around the table, the man, being very much interested in the children, noticed a downcast expression on Judy's face, and asked: "What's the matter, honey, are you sick?" and Judy sadly explained: "I can't eat without giving thanks to God and asking His blessing on the food." The visitor responded: "Go ahead, honey, and say it."

Judy not only asked a blessing upon the food.. but she thanked the Lord for bringing their friend to their home, and prayed that he might arrive safely at his destination. It was a beautiful prayer and when the man spoke again it was with tears in his eyes and a quiver in his voice, because he had received the surprise of his life. He said: "Thank you, honey, this is the first time anyone has ever prayed for me. Would you please write it down for me? I'd like very much to have it."

The man was interested beyond anything they had imagined, and the whole evening was spent in telling their rich guest how they happened to accept Christ as their Messiah and Saviour, each with a Bible in hand.

The children of the public school she attended elected that same little girl president. So, as president, she inaugurated the ideal that at lunch time, someone in each group must ask God's blessing on the food. The principal though a Christian gentleman, questioned the advisability of this, since the children came from all sorts of homes. But the little girl seriously told him she would give up her office rather than be obliged to ignore or slight the Lord. The principal evidently decided to take the consequences, if any; and prayers are being said every day before lunch.—ANONYMOUS.

THE CURE

By Eleanor Crannell Means

"There, Aunt Mattie," said Sylvia resignedly, when she had watched Delma down the front walk and closed the door, "You see now how hopeless it is, don't you?"

"Hopeless?" said Aunt Mattie. The bright content of her smile belied the resignation of her invalid's chair.

Sylvia made a little grimace. "Her manners are awful, of course, but I wouldn't mind them. But her ideas! Like when she said, 'Oh, ma's only a seamstress and folks high-hat us, but I don't care; I'll get away from this hole and get some dought somehow, and then I'll come back and cut 'em all dead!"

"There was a rather acid spirit displayed in that and some of her other remarks," agreed Aunt Mattie. "Not exactly Christlike. If you could get her into your Sunday school class, though—"

"Aunt Mattie!" protested Sylvia. "Our nice class! She'd ruin it."

"Suppose," said Aunt Mattie, "someone, Miss Peabody, your delightful English teacher, just for example, had a close friend visiting her for a very short time who was a marvelous surgeon. And that she knew that this doctor would be able to cure—me. How would you feel if Miss Peabody said, 'Oh, no. It would take so much of the little time we had together. He simply can't.' How would you feel toward Miss Peabody?"

"She wouldn't," said Sylvia indignantly.

"She isn't a bit nicer than you," said Aunt Mattie, smiling. "And you just said the same thing!"

1. What is it we know that would cure the illnesses of the whole world?

2. What responsibility does this knowledge of ours lay upon us?

—Y. P. Leader.

THE FORUM

The Modern Farmer

Published monthly by the Modern Farmer at Nashville 3, Tennessee.
Giles A. Hubert,_____ Contributing Editor
Sadie Wilson _____ Secretary
Henry Allen Boyd_____ Publisher
Office, 403 Charlotte Avenue.

Devoted to the interests of the Farmer, Truck Gardner, Livestock and Poultry, Breeder, the Home and the People.

Entered as Second Class Matter, April 10, 1929. at the Post Office at Nashville, Tenn., under act of 879

All contributions for publication in the Modern Farmer, should be addressed to The Modern Farmer, 403 Charlotte Avenue, Nashville 3, Tenn.

No libelous matter will be published. Unsigned articles or letters, and those written on both sides of the paper will not be used.

Subscription price $1.00 per year, 75c for six months, payable in advance. Personal checks must be certified. Make all checks or money orders payable to The Modern Farmer.

Advertising rates and sworn circulation figures presented upon application.

Statement of Ownership

The Modern Farmer as required by the Act of Congress, Aug. 24. 1912, State of Tennessee
County of Davidson.

Personally appeared before me, a Notary Public in and for the State of Tennessee, County of Davidson, S. B. Wilson, who having been duly sworn according to law deposes and says she is Treasurer of the Modern Farmer and the following is to her knowledge and belief, a true statement of the Ownership, Management, etc., of the said publication for the date sworn in the above caption requested by the Act of Congress, August 24th, 1912, embodied in section 443 Post Office laws and regulations:

1. That the name and address of the publisher and treasurer of the Modern Farmer is Nashville, Tenn.. S. B. Wilson, treasurer.

2. That the owners are Henry Allen Boyd and S. B. Wilson both of Nashville, Tennessee.

3. That there are no known bonds, mortgages or other security holders or owners holding 1 per cent or more and that there are no bonds, mortgages or other securities on the corporation.

(Signed) Sadie B. Wilson

Sworn before me this 17th day of September 1947. My commission expires October 17, 1950.

Maryland Colored Veterans

(Continued from page 1)

about nine inches of top soil in what is now the continental United States. But since that time we have let three inches of soil wash or blow away.

Harry Collins, superintendent of the State farm, told the veterans that it was just plain good business to conserve the soil. Before we began soil and water conservation here, he said, we had to buy hay for iur work-stock every year and we just couldn't raise beef or dairy cattle because we didn't have the feed. Now we have 60 head of cattle and we produce enough feed for all of them, as well as for our work-stock. Beside, we have extra hay in the barns. Some of it has been there since 1944, Mr. Collins said.

Urges Farmers to Grow

(Continued from page 1)

agent, and Ross W. Newsome, State Extension agent.

In his address, Compbell stressed the conference theme: "The farm and home as a unit for better living." The veteran field agent told the board delegates and county agents that Booker T. Washington had aimed at the same goal nearly 60 years ago when he called the first farmers conference at Tuskegee "But," said Campbell, "attainment of that goal is still afar off."

Pointing to Selective Service records of rejections of rural youths, Campbell asserted, "We still have a long way to go in learning how to prepare and serve balanced meals and in maintaining a home that is conductive to good health. More than half the rural homes in the South are beyond repair. And it would take about 15 million gallons of paint to paint all the homes in the rural South needing it."

Then the field agent added that in addition to raising top grade tobacco and fine healthy livestock and poultry, we must also grow a better crop of children. "This," he said, "is the most important crop of all; and a healthy, Christian home is the soil in which sound bodies grow."

The board delegates pointed out that while many Virginia farm homes—like those in rural areas in the rest of the nation—are in dire need of repair or rebuilding, some home improvements are being made in the State. In the 39 counties from which reports were read, about 500 rural homes were painted last year and several other improvements were made such as the addition of electric lights, running water, and bathroom facilities.

Miss Wallace, the Assistane State Director, said: "You and many of the other leaders may have comfortable homes with running water and electric lights, but what about your neighbors? Too many of them tre still carrying water from the spring down the road, too many are trying to read by lamp light, and too many of their homes are still over-criwded, poorly ventilated, and nusanitary. Your job will not be finished until your neighbors, too, are comfortably housed," she asserted.

One of the highlights of the conference was a tour of Conroy Thompson's 300-acre farm near Hewlett. There the delegates and Extension agents observed the application of modern farming practices and the maintenance of a comfortable home with all modern conveniences.

Southern School Children to Get Wholesome Dry Milk

As a result of dry milk rescarch, at least one glass of milk may be available every day during the coming school year for every child participating in the Federal School Lunch Program, say officials of the U. S. Department of Agriculture.

Not all of the milk will bc fresh. In milk-deficit areas of the South and other regions, some of it will be reconstituted nonfat dry milk. But the dry milk contains all the calcium, riboflavin. and protein that fresh whole milk contains. School children can get enough fat and vitamin A, which are missing, from carefully sclected other foods.

Here and There

Companionship with a dog has a psychological effect on children and adults alike. Take, for instance, the boy who has a dog which has been "bluffed" into running by the neighbor's dog and then suddenly turns and thrashes the "bully." Here is an object lesson for the boy. You will hear him tell his pals with pride of how his dog wouldn't be bluffed.

——Ken-L-Bits

Mechanization of Small

(Continued from page 1)

of cotton production in order to enable American cotton to compete more effectively with foreign grown cotton and domestic synthetic fibers, the Assistant to Secretary Anderson said that consumption of rayon is now equivalent to more than two million bales of cotton annually.

Consumption of other synthetic fibers, he said, is rapidly increasing. Since 1940, the consumption of nylon, vinyon, aralac, saran, and spun glass has increased from 4½ million pounds—the equivalent of 10,000 bales of cotton—to 53 million pounds or the equivalent of nearly 120,000 bales of cotton.

Through research, mechanization, and hard work, White said, the cotton industry should be able to meet this competition and move ahead into a long period of prosperity.

Side Line Crops

(Continued from page 1)

held in a strawberry patch, County Extension Agent A. M. Dobbins explained how the berries were grown the amount of fertilizer used. the yield obtained, and the quantity already sold which had brought nearly $700.

Jeffries was sold on strawberries as a sideline crop, and on demonstrations as a good way to learn what was going on. Last year he marketed $1,200 worth of strawberries, 500 worth of tomatoes, $160 worth of syrup, besides seven bales of cotton, nine tons of cabbage, and $87 worth of chickens, eggs and potatoes. Added up, he had grossed about $2,800.

Mrs. Jeffries keeps books, handles the garden and chickens, and, of course, she does the canning. Last year, she canned 300 quarts of food. "About the only thing we buy is sugar, coffee, and flour," she says; and she has an itemized record to show every penny they have earned, and every penny they have spent since 1940—their only good year in 22 years of farming.

"As soon as the price of land settles a little," says Mr. Jeffries. "we are going to buy about 60 acres We think we have almost enough saved for that."

Assistant State Agent Williamson says that, like the Jeffries, hundreds of colored farmers in the cotton area of western Tennessee are upping their income and ensuring their place on the land by growing sideline crops.

Haiti Developing Rubber Industry

The production of natural rubber may become a major industry in Haiti and other Latin-American countries. says Dr. E. W. Brandes, who is in charge of rubber investigation for the U. S. Department of Agriculture.

Rubber growing in Haiti and the other Latin-American countries is the outgrowth of the joint efforts of the United States and these countries to produce natural rubber during the war.

Dr. Brandes points out that the cooperative rubber program has emerged from the nursery stage in several Latin-American countries, including Haiti. He says that about 29.000 acres of field plantings have been established in Haiti, Honduras, Mexico, Brazil, Columbia, Peru, Costa Rica, and Guatemala. In Haiti alone, there are about 4,000 acres of rubber.

Haiti's long-time calls for the inclusion of natural rubber in the country's diversified farming program. Dr. Brandes believes that hundreds of small farmers may find it profitable to grow a couple of acres of rubber as a sideline crop. At the current price of rubber, two acres would gross a farmer about $300.

The high-yielding Hevea trees, which have been established in Haiti, are ready for tapping after several years. They continue in production for decades, reaching maximum production between 20 and 25 years after planting.

Byrd's Nest

(Continued From Page 1)

Surely it is true that many men put finishing touches to their lives but too often use clay or mud where spiritual pitch is needed. If persons in the process of development would accept more advice from God and less from men, we would have more finished characters in the world today. Paul said a number of things which bring joy and shouting among men of today, but to many, including the writer, one of the greatest things Paul ever said about himself was, "I have finished my course." Without God Paul was no more than the average man of this day, but with God, he put the finishing touches on a career. So can you if you are willing to be guided by the Spirit.

Peace Instead of War

By D. E. Hale

Perky" was a nice little gray kitty. We gave her a snug box to sleep in and for housekeeping when her babies arrived—as arrive they did. three of them, all DEAD.

Perky was inconsolable, so when we found that "Blacky," a plain alley cat. had a litter of five husky little felines under a corner of the barn we took two of them and placed them in Perky's box. Perky cuddled them, licked them and purred delightedly over them, but in a few minutes she jumped out of the box and soon returned with another of Blacky's kittens in her mouth. She placed it gently with the other two, then, making two more trips, she brought the others and settled down to housekeeping, with a real family.

When Blacky returned and found all her kittens gone she prowled around until she found Perky with her adopted family. She retired to her home under the barn and waited. Sooner or later she knew Perky would leave her family and go a-hunting. Sure enough, after the kittens were fed and licked clean, Perky jumped out of her box and went about affairs of her own.

As soon as she was out of sight Blacky began the task of returning her kittens. One at a time she carried them home and settled down contentedly.

Perky made no fuss when she found her family gone but waited till Blacky went a-hunting, then she carefully carried all five of the kittens back to her box only to have them stolen again by their rightful mother.

Perky gave up and mewing plaintively she presented herself at Blacky's home and offered to help nurse the kittens. Blacky moved over and Perky moved in and the two cats took over the job together. nursing, washing and caring for them, each helping willingly when help was needed.

Peace instead of war—and how much better—no—wounds no casualties—and a just division of labor.

Are cats wiser than men?

I cannot understand why so many millions of good brains and potential successes are satisfied to be stagnant pools in the swift river of life. I cannot understand the lack of ambition, of zest and enthusiasm, that makes so many expect to get a lot and give so little. Too many people still think the world owes them a living, without realizing that nobody owes them anything unless they have done something first, and that it must have a value

—Erick Brandies

To Kill Ragweed, Plantain Spray Carefully with 2-4-D

By Floyd Bralliar, Garden Editor The Nashville Tennessean

Ragweed will soon be full bloom.

But ragweed pollen is recognized as the most common cause of hay fever. It has been proved that any of the weed killers that contain 2-4-D are surefire killers of ragweel if properly applied. While they do not kill these weeds at once they do stop the production of pollen almost at once and kill the weeds outright in a week or 10 days.

These weed killers can be bought at most seed stores. There is nothing difficult or mysterious about their use and they are not expensive. Why not get rid of the ragweed on your place and near it before any seeds are formed for next year? And while you are spraying, get rid of the plantain, the chickweed and the dandelions on the lawn. Of course, if your lawn contains an abundance of white or any clover, the spray would kill this also.

Not enough has been said about the way this material kills. For this reason many users have been disappointed with it because it does not kill at once. The 2-4-D is absorbed by the leaves on which it falls and is circulated by the sap to all parts of the plant. This may take as long. as two or three weeks. If a dashing rain falls on the leaves and washes them clean of the spray material before the leaves have time to absorb it. if the rain comes in less than 24 hours after the spraying is done—the plants may not have absorbed enough of the material to kill them and a second spraying may be nccessary.

And while fighting weeds, why not fertilize the lawn. August or September are the months when all lawns that were not well fertilized last spring should be fed. We cannot hope to have good lawns year after year unless we fertilize regularly. None of the really good lawn grasses can thrive on a starvation diet, but some of the weeds and obnoxious grasses root deeply enough to find food below the reach of the lawn grass.

National Research Body Makes Recommendations

Recommendation that special emphasis be placed this year on research in marketing efficiency and wider utilization of farm products has been made by the National Advisory Committee established under the Research and Marketing Act of 1946.

,The committee made this recommendation at its recent meeting in Washington with Secretary of Agriculture Clinton P. Anderson and other Department officals. It also recommended that a large share of the $9,000,000 which Congress has appropriated for research under the Act during the 1947-48 year be used to develop a practical method of marketing critical farm surpluses that may arise in the years ahead.

The committee further suggested that the Department speed up the program for this year by contracting with private agencies where they can do work more rapidly, more effectively, or at lower cost than by government facilities.

Among specific suggestions were studies in cost of distribution of various commodities, development and expansion of markets, and research on new uses and by-products. The appropriation provides $3,000,000 for research in the utilization of farm products.

Virginia State Plans Expansion of Experiment Station Program

An enlarged program of agricultural experimentation is planned at Virginia State College, only Negro Land-Grant institution with an Experiment Station unit, reports Ross W. Newsome, State Extension agent with offices at the Petersburg, Va., college.

Announcement that the college is working toward a more extensive program of experimentation was made by L. H. Foster, president of the institution, in an address last week before farmers and county agents who were making a tour of the Experiment Station. Pres., Foster pointed out to a group which represented 12 coonties that an expanded experimentation program would enable the college to greatly increase its services to the colored farmers of Virginia.

The tour was conducted by M. T. Carter, superintendent of the station, and Dr. John L. Lockett, director of the school's division of agriculture. The farmers and agents observed nine major experiments which were underway. One of the highlights of the tour was a discussion by the farmers of the benefits derived from adopting recommended farm practices. Ms-Kenzie Talley, $15,000-a-year dairy farmer, told the group how following such practices had enabled him to develop and enlarge his dairy farm.

PRESERVE THE FAMILY

The Christian Obligation to Create Ideal Family Life
By S. Fraser Langford

American family life can come to full strength only in an atmosphere of freedom. Our homes should form the pattern of the state rather than the state form the pattern of the home. Each home should be an ideal commonwealth in miniature, with a maximum of freedom and a minimum of law administered by parents, whose dominant purpose is to make it easy and pleasant to be good and difficult to be bad. Law should grow out of the developing family life as need arises in order to make conduct conform to the best interests of the family, and it should be administered with impartial firmness.

There must be a return to religion if American family life is to be strengthened. Materialistic philosophy has not helped American family life. Prayer and the reverent study of the Bible and the best devotional books of the day will be most helpful. The reading passages should not be chosen at random, but should be chosen with special reference to family needs selected from Biblical situations designed to inspire high moral ideals and to motivate right moral decisions. Passages portraying desirable character traits such as honesty, tenacity of purpose, purity of motive, sympathy, and reverence should be carefully chosen and read in the family circle.

The state or the municipality can and should protect the family without interfering with its freedom. American family life is under severe strain. Many American homes are disintegrating. Two million "uprooted Americans" are on the march seeking higher wages or following the crops. These families, temporarily housed in trailer camps or depressed areas in war-boom towns that mushroomed overnight, are once more on the march as these war-boom towns have folded up. The lack of privacy in many of these temporary shelters has not helped family life.

Nor are the great cities friendly to family life. Some young families have found homes on quiet streets with yard space for their growing children to play, but thousands more have been thrust by circumstances into dingy and unsanitary hotel rooms with all the attendant irritations which go with close confinement. These young people find it inconvenient to have a family. Under the threat of atomic war, the planners of cities are suggesting that we break up the great cities into smaller aresa, lest one atomic bomb destroy an entire city over night, but the city need not fear an atomic bomb so much as it need fear its own colossal size, its narrow streets, its shrinking home space, with no place for the coming of children. It would strengthen American family life if city authorities made better provison for families in which to live. If we do not decentralize our cities, we shall become a dying nation. We cannot have strong homes with a steadily declining birth rate, for homes are often held together by the tiny hands of little children.

No strong family life can be developed in America unless one or both parents spend a considerable time in the home. As Edgar Guest once wrote, "It takes a heap of livin' in a house to make it home." Sometimes children are not wanted because the wife wants better clothes than the husband's pay check can provide, and, almost unnoticed, the years for childbearing have gone by. And if children are born to them, all the more need for at least one parent to guide the growing life of the child. We cannot expect some chance neighbor to guide the impulses of the growing child into constructive and useful habits. Neighbors and the police are apt to think that restraint is better than constraint in handling a child that is running wild.

It would strengthen American family life if the parents would become total abstainers for the sake of the child. Medical authorities affirm that if both parents are chronic drinkers, eighty-six per cent of the children born to them will be epileptic. We cannot afford to ignore the challenge of the child if American family life is to be strengthened. Something must be done to change the conditions which make one out of every eighteen children in the United States a delinquent or an inmate of a prison. Ten years ago, Mrs. Carl R. Gray, American mother of 1937, said, "We must build together with God that our nation fall not, nor crumble as others have crumbled." It is worth the effort if American family life is to be strong.

—The Watchman-Examiner.

FARM TALK WITH FARM FOLK

—By Jesse Safley

In case you are one of the Many Farmers who yet fail to appreciate the value of fertilizer in corn production or feel that the increased yield will not pay for the fertilizer application, we suggest that you visit the corn fertilizer demonstrations which are being conducted in your county. Even though you may have observed one or more demonstration earlier in the year it would be worthwhile to make the same round again after the corn is more mature.

During the past week we have visited demonstrations of this type in Davidson, Williamson and Rutherford counties which are being conducted under the supervision of the county agents cooperating with the fertilizer industry. The type of soil on which the corn is being produced varies from bottom land to cedar glade land—but the results in each case are the same. On that portion of the crop where the fertilizer was applied the prospects for a desirable corn crop are good, while the non-fertilized areas yield will be slight.

Those who think that fertilizer contributes to the speed corn will burn up during dry weather are certain to change their minds when they visit the demonstration plots. Later in the season we will publish the yields and compare the cost of production where fertilizer was used with that where no fertilizer was applied.

Farmers who expect to receive the minimum amount of grazing from fall pastures of crimson clover and barley should make seedings as soon as possible. It has been proven that in most cases the amount of grazing produced from fall seedings varies as the date of seeding varies. In the past there have been many farmers who have lost faith with fall seeded pastures simply because they failed to seed their crop in time for a desirable growth before cool weather.

While some farmers say they don't think it pays to seed crimson clover after the first of September, there are others who have had very favorable results when the crop was not planted before the middle of September. The later the crop is seeded the less pasture you can expect to have in the fall. That is a fact, however, when a crop is seeded late and a good stand is secured and retained through the winter, chances for early spring pasture are practically as good as on the early seeded crops.

Often weather conditions prevent a farmer from seeding his crop as early as he would like, but those who really appreciate the value of fall pastures and winter cover on the soil will complete the job before it is too late, if there is any possible way to do it.

NEGRO LAND OWNER VITAL, SPEAKER SAYS

(by Associated Press)

"The Negro land owner is the bone and the sinew of the Negro race," Thomas M. Campbell, Negro field agent of the Southern Regional Agricultural Extension Service, told 1,000 members of his race who recently attended the seventh annual field day at the Delta Experiment Station in Stoneville, Miss.

"Too many of our children are being led away from the farm and from the South. It is up to you to make your farm home life attractive and profitable enough to keep them at home," he said,

Campbell, from Alabama's Tuskegee Institute, is the first Negro agent appointed to the U. S. Department of Agriculture's Extension Service. In 1930 he received the Harmon Award of Agricultural Service and was recently part of the church missions commission sent to study agricultural and educational conditions in West Africa.

He cited the poor living conditions of the southern Negro as the principal reason for his leaving home. Most of these conditions, he said, could be remedied by the Negroes themselves.

"Nobody is going to come down here and do it for us," he said. "It behooves us not only to have a home, but to develope it."

Particularly he advised, houses should be painted, or at least whitewashed. screens should be put on windows; sanitation practiced, and improved methods of farming should be studied.

"It is time to get serious about education," he said. "Judging from the action of parents who refuse to send their children to school and officials who don't enforce compulsory education laws, many of us aren't sympathetic with education.

"We are plagued with delinquency among our youth. We have allowed our homes to become so disorganized that we are turning out the wrong kind of people. We must build our homes into disirable units. We can do it with the cooperation of all—white and colored alike.

The Negro Delta field day was first organized in 1941 by Charlie Burton, Negro Washington County agent, and the late Washington County agent, J. W. Whitaker. At the first meeting some 200 Negro land owners toured the experiment station at Stoneville and heard addresses on farming problems. This year the meeting was attended by 1,000 Negroes from 18 Delta counties.

LAMB CROP SHORT

The 1947 lamb crop is approximately 6,000 head short of last year's crop, according to officials of the Tennessee Department of Agriculture. Production this year was 207,00 as compared to 276,000 in 1946, and a 310,000 average during a period of 10 years from 1935 to 1945.

The national production is nine per cent less than last year and more than 25 per cent less than the 1935-1945 average.

Paprika, the red spice from a mild-flavored pod pepper, is known to be high in Vitamin A content.

Negro Versus Insurance

The subject Negro versus Insurance offers one of the greatest subjects that could be analyzed.

In one corner we have the Negro with his many problems such as children to be educated, home to be bought, old age to be secured, business to carry on, the necessities of life to be looked out for, and the luxuries to be taken care of, plus the many other things that life affords.

And in the other corner we have insurance and the many possibilities that insurance affords if the right policy and the right amount is obtained and is carried to maturity.

We are a people of limited means and therefore should carefully study our problems of finance and guide ourselves carefully, especially in our insurance selection since it is necessary to carry our insurance to maturity or to a limited number of years before we can reap the benefit of our sacrifice.

The education of our children is our sacred duty therefore the first consideration should be a policy that will in years at least help to provide money that will see our children through graduation and possibly a college career.

Our next consideration should be a policy that in years would make provision for that down payment of a home that would ease our burdens and our minds and give us that sense of security that goes along with stability. There are a very few of us who haven't felt at sometimes in our lives that we would like to go in business and also we would be thinking in terms of children too, as we know businesses are handed down from one generation to the other.

We as Negroes have never learned yet that life insurance can afford us all of the necessities of life even some of the luxuries that life affords.

In the other corner we find Life Insurance standing out as a beacon light of security both to the young and to the old asking that we accept it and make our independence secure. But we as Negroes have less insurance than any other group of people and the one great question of the Negro insurance agent has been "How can I get my people to buy more insurance?"

Yet we know that there is invested in insurance more money than in any other commodity on the market. But we find among our people that only one in ten has two thousand dollars invested in insurance, that one in one hundred has five thousand dollars, and just one in one thousand has ten thousand dollars, and one in ten thousand has twenty-five thousand dollars. We certainly find that these figures are far too small for any group of people.

Still another question presents itself in Negro Versus Insurance and that is the lack of holding on once the idea has root. For we find that the life of an insurance contract in our group lasts less than five years. The stability which is necessary to reap as set out in our contract is not impressed on the minds of the buyer. Then too, it is noted that we buy too much insurance on friendship and find that friend has not the stability to protect our interests. That friendship don't last long enough for us to reap benefits that should be ours.

These are just a few factors that should seriously be considered by our people in making their insurance selections.

The Supreme Liberty Life Insurance Company entered the life insurance field in Nashville in 1925 and for twenty-two years we have tried to serve the needs of our people. We have over two and one-half million dollars on the lives of seven thousand Negroes in and around Nashville. After twenty-two years we are collecting over thirteen thousand dollars each week.

We have paid out $11,450.45 to the beneficiaries in 1947 on fifty-four claims. We have paid out as cash surrender and maturity endowments $1,315.02.

Supreme Liberty Life writes five sound contracts that will not only provide money for your children's education, but will give you a certain amount of independence and security during your old age and will also provide that margin of safety and the protection of those necessities and luxuries that we so desire in life.

We are also glad to be able to serve our people and our agency force is always willing and ready to give that service that can be appreciated by the public.

SEES ALL WE HAVE AND ARE AS DEBT TO GOD

By Robert P. Patterson, Former Secretary of War

As humanity continues to gain a more complete knowledge of the physical universe, the small world in which we live becomes to the average man increasingly confusing and disconcerting. A great deal of our present economic and social problems stem directly from this tremendous physical progress, sometimes accomplished at an apparent loss of some of our spiritual and moral development. What better guide can we have through our complex difficulties than an unwavering faith in God.

It is easy for Americans to contemplate our great industrial strength, our magnificent institution of democratic government, and conclude that all these things are man made. We must cherish belief in the divine origin of our moral strength if we are to maintain our leadership in the world. We must see that all of what we are or ever will be is a debt we owe to God.

Through the tireless work of our churches, and organizations such as the International Council of Religious Education, America's citizens must be reinspired with a spiritual faith and moral integrity.

WINTER PASTURE SLASHES COST OF FEEDING HOGS

Seeding time for fall and winter pasture is an important date on the Tennessee swine producer's calendar, according to U-T Extension swine specialists, in as much as finishing hogs on pasture has been shown to be the most profitable method.

This is shown by tests conducted by U-T Agricultural Experiment Station over a 90-day period from last December to March this year. Results show that hogs finished on any combination including good pasture netted more per hundred pounds than those finished without pasture.

Several lots, each fed different rations, were used in the test. Here are some of the results:

Lot One was given shelled corn, self-fed, on crimson clover pasture. Average gain per pig was 85 pounds and feed cost exclusive of pasture per 100 pounds' gain was $8.98.

At the other extreme is Lot Seven, which was fed a ration of shelled corn and a 50-50 mixture of cottonseed meal and tankage, self-fed in dry lot. Average gain per pig was 78 pounds; gain was $14.79. This same ration with crimson clover added was used for Lot Five, which showed 135 pounds' gain per pig, and a feed cost of $9.22 per hundred pounds gain.

Swine producers should plan now to provide pasture this fall and winter, since pasture feeding is cheaper than any other finishing method.

There is more total feed value in pasture from one acre of crimson clover than there is from one acre of corn. There is also as much protein in two acres of crimson clover as is contained in one ton of cotton-seed or soybean meal.

The hardest job farmers have to do in August is to decide to do those jobs which have been postponed all summer. Cleaning out the barnlot and stalls might not be a pleasant thought right now but it is one job which should be completed before fall crops are seeded.

USDA to Hold Hearing on Wage Rates for Virgin Island Sugarcane Workers

The U. S. Department of Agriculture has announced that public hearing on sugarcane wage rates and prices for 1948 will be held in the Virgin Islands on October 2. Similar hearings on both sugarcane and sugarbeet wage rates and prices will be held between September 29 and October 29 in Puerto Rico. Hawaii, and California.

The holding of these hearings is in accordance with the Sugar Act of 1937 as amended. As one of the conditions to be met in qualifying for payment under the Sugar Act, growers must pay in full all persons employed in the production of sugarcane or sugar beets at rates not less than those determined to be fair and reasonable by Secretary of Agriculture after publie hearing and investigation.

The Act also provides that in qualifying for conditional payments, producers who are also processors must pay for sugarcane or sugar beets purchased from other growers at prices determined to be fair and reasonable by the Secretary of Agriculture.

7 Million Youngsters to Geet School Lunches This Year

About seven million white and colored pupils will benefit from the School Lunch Program this year, the U. S. Department of Agriculture announced last Monday when it made the initial allocations of funds to States and Territories for the operation of the program.

A total of $48,750,000 of the $65,000,000 appropriated by Congress for the current program has been apportioned to the participating States, the District of Columbia, and to the Territories of the Virgin Islands, Puerto Rico, Hawaii and Alaska. These funds will be used by State and Territorial educational agencies to partially reinburse participating schools for their purchases of food for school lunches.

The remaining $16.250,000 aside from the amount needed for administrative expenses, is available to the Department of Agriculture for the purchase of foods needed by sehools to meet specific nutritional requirements.

Funds for the program are apportioned among the States and Territories according to the number of children of school age and the per capita income of the State. The law requires that Federal funds accepted for the program must be matched by funds from sourees within the States.

The current program is substantially the same as last year's except that no funds are available this year for the purchase of school lunch equipment. Last year $10,000,000 was set aside for this purpose.

Revised Home Canning Bulletin Now Ready for Distribution

A revised edition of the U. S. Department of Agriculture's bulletin on home canning of fruits and vegetables is now off the press and ready for distribution.

The revised bulletin incorporates improved directions resulting from recent intensive research on household methods of eanning low-acid-foods. This research was carried out by the Department's Bureau of Human Nutrition and Home Economics.

The revised brochure also gives picture stories and directions for eanning fruits and vegetables in tin, as well as glass. And it contains two pages of questions and answers to provide help with some questions that are frequently asked.

The bulletin, Home Canning of Fruits and Vegetables, AIS-64 ean be obtained . five cents per copy from the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

Arts of Peace

Not all of the scientific energies of the time are being devoted to the production of atomic bombs, guided missiles and other instruments of world destruction. There are still laboratories which are concerned with the arts of peace, and with developing products which will contribute to the well-being and living standards of all the people.

Present experiments in producing oil from coal presage something of an industrial miracle. The enormous and virtually limitless demand for oil products of hundreds of kinds has caused an acceleration of this work. As long ago as 1910 a German scientist worked on a process of hydrogenation of coal into oil. Important progress in this direction was made by German and British scientists between World Wars I and II. However, in all of the methods developed, the cost of the product was several times greater than the cost of producing gasoline from petroleum.

Now, however, recent American research and engineering developments make it appear that within a few years synthetic gasoline will be produced from coal at a cost very close to that of production from petroleum or natural gas. An exploratory program has been completed, and the next step is to be a large-scale pilot plant program. The purpose of pilot plants is to-fold—first, to obtain design data for commercial plants and, second, to work out operating factors and engineering methods that cannot be investigated within the limitations imposed by a laboratory. Commercial production is the final stage.

This is an example of how American industry prepares for the future. One characteristic of free enterprise is that it never is content to stand still. It always looks far ahead.

Give Storekeeper His Due

A number of chain retail systems have periodically issued public statements showing what happens to each dollar spent with them. Every item of expense, the cost of goods, rents and leases, wages, taxes etc., is detailed. Finally, the profit retained by the stores is shown, and it is one of the smallest items in a long list.

What is true of the chains is true of practically all other kinds of retail business. Profit accounts for a remarkably modest part of each dollar which goes through the till. But, according to surveys, millions of consumers are completely unaware of this fact. Some of them actually believe that typieal stores, even those dealing in staples which carry the lowest mark-up of all commodities, make a net profit of as much as 50 per cent on each sale. Gross misinformation such as that is obviously responsible for consumer denunciation of retailers as the agents responsible for price inflation, and for picketing of stores by eonsumer organziations.

A great many consumers, in addition, seem to have no idea of the influence competition has on retail business. In sizeable communities, the business blocks are lined with stores, and each one is after the trade of the man next door. Even in very small towns, competition is a living foree. If local people don't like the prices, services or stocks of some crossroads emporium, they will go to the next community and do their shopping there.

The retailer has been unjustly critieized. It is time the public considered the facts.

Plan Now

To earn your payment under the ACP program by seeding all soil that is subject to erosion to some type of approved cover erop. Make certain the seed bed is properly prepared and the correct amount of lime and fertilizer has been applied.

To make sure no matehes or pieces of metal are lost in harvested cotton. A small spark caused by either can result in a heavy loss to the ginning company.

To market cattle before they lost a part of the flesh gained during the summer.

To plant late garden crops while there is still time.

To Seek New Foreign Outlets for U. S. Farm Products

As part of an over-all program to expand markets for U. S. farm products, action has been approved by the U. S. Department of Agriculture under the Research and Marketing Act of 1946 to assign commodity specialists to work in this country and abroad to stimulate foreign demand for U. S. grown products.

Principal items for which markets will be sought are cotton, tobacco, rice, fruit, and tree nuts. These are usually produced in quanities in excess of normal domestic needs.

It is pointed out that cotton has long been our most important agricultural export commodity. Normally, American producers have been dependent upon foreign outlets for approximately half of their production. Increasing competition from synthetic fibers, paper and foreign eotton, along with the problem or dollar exchange make it highly important that special efforts be made to maintain this foreign market. Also, Department officials indicate official representation abroad seems essential to help American farmers keep their tobacco export market.

"Fire Safety on the Farm"

As part of a nationwide educational program to inform the American farmer of the fire menace which destroyed $90,000,000 worth of farm property and elaimed 3,500 lives on farms in 1946, the National Board of Fire Underwriters has issued a new 24- page booklet, "Fire Safety on the Farm."

The booklet outlines corrective measures for the two basic causes of farm fires—faulty building construction, and lack of knowledge. The hazards in dwellings, barns and outbuildings are analyzed, with special emphasis on the increasing electrical and flammable liquid hazards found on the modern mechanized farm. Recommendations are made for eombating two of the worst farm hazards-lightning and spontaneous ignition. The booklet also lists fire safeguards which should be included in the eonstruction of new buildings and provides suggestions on how existing structures may be brought up to a reasonable level of fire safety.

Of great importance, the handbook is a practical guide for the organization of a system of home fire prevention, and details what to do when fire breaks out, the equipment needed, and how to fight different types of fires. In addition, the need for community fire protection and cooperation with volunteer fire departments are stressed.

Single eopies of "Fire Safety on the Farm" may be obtained free from the National Board of Fire Underwriters, 85 John St., New York 7, N. Y.

REA Electricity to Be Extended to More White and Colored Farmers

About 236,000 white and colored farm families and other rural consumers, schools, churches, and cross roads stores, in 16 Southern States will get electric service as a result of loans approved by the Rural Electrification Administration during the last fiscal year, the U. S. Department of Agrieulture announced last week.

Altogether, the loans approved will enable borrowers, most of them locally owned and operated rural electric cooperatives, to build over 135,000 mies of new power lines and increase the capacity of some of the systems already built, making electric service available to 396.000 rural consumers.

The loans approved amount to $251,349,172; about 44 percent of this sum goes to the Southern States where over 1,600,000 farms are still without electric service. For the country as a whole, approximately 250.000 and at least as many rural establishments were without electric service as of January 1.

FHA to Make 130,000 Loans This Year to White and Colorèd Family-Type Farmers

The U. S. Department of Agriculture announced last week that the Farmers Home Administration will be ablc to make approximately 130,000 farm operating and ownership loans during the current fiscal year to white and colored family-type farmers who are unable to obtain credit from any other source.

These loans will be made out of the $84,500,000 fund authorized by Congress. As has been the practice during the last few years., veterans will receive preference. Additional credit aid will be made available to farmers through the new insured mortgage program.

This program was authorized by Congress in 1946 but insurance funds were only recently appropriated. Banks and other financial institutions or individuals may participate. Insurable loans ean be made for up to 90 percent of the reasonable value of the farm and improvements. The loans carry the equivalent of 3 1-2 percent interest and are repayable in 40 years.

Up to last year, FHA and its predecessor agencies had made loans to nearly 150,000 colored farmers. About 5,000 of these had received loans to buy farms of their own. Altogether the agency had made about a million loans. Estimates of the number of loans which can be made by the Farmers Home Administration this year follow:

Production Loans: Out of a $68,000,000 fund, the agency will be able to make operating loans to 19,000 family-type farmers. These loans are repayable within five years. An additional 71,000 loans will be made to similar families who are now receiving assistance and who require supplemental credit to continue their progress and safeguard the Government's interest. Also, there will be 37,000 one-year loans made to families who need financing for their annual farm operations.

During the last fiscal year, FHA made 192,400 production loans 22,400 applications, including 10,900 from veterans, remained unfilled.

Farm Ownership Loans: This type of supervised credit enable fram tenants, shareeroppers, and farm laborers to buy and operate farms of their own. It also helps owners of under-sized and under-developed farms to create adequate family farm units. The $15.000,000 appropriated for direct farm ownership loans will assist about 2,000 families Last year, more than 5,600 direct farm ownership loans were made. Sime 71,000 applications, including 35,000 from veterans, were on file on July 1.

Water Facilities Loans: The $1,500.000 appropriated for this purpose will enable about 1,100 farmers and ranchers in the arid and semi-arid areas of 17 Western States to develop adequate water supplies.

Sow Farrows 149 Pigs Worth $3,933

A Poland-China pig, bought in 1937 for $12.50 has brought to Richard Smith or Hopkins County a total of $3,933.60 for 149 hogs weighing 32,780 pounds. During this 10-year period, the sow farrowed 17 litters, or a total of 171 pigs. Smith operates a 300-acre farm in the Anton Community, according to Farm Agent J. Stanley Howard.

Ham and Egg Shows

Otis S. O'Neal, founder of the Georgia Ham and Egg Show at Fort Valley, is planning a series of county shows to be held throughout next February and part of March. State Agent P. H. Stone has announced.

"A neighbor, Jed Hill, said that if he had not snatched the bun out of the young woman's hand, she probably would have killed her husband. — SANFORD (Ky.) OBSERVER.

South's Wartime Farm Migration Loss Still Stands at Nearly 3 Million

Although the South shows a net wartime farm migration loss of nearly three million, white and colored farm people, within the last two years it has offset almost 50 percent of this decline through the return of veterans from the armed forces and through a higher birth rate, according to estimates of the Bureau of Agricultural Economics of the U. S. Department of Agriculture.

BAE estimates the national farm population at 27,550,000 as of January 1 of this year. This is 2,360,000 greater than it was in 1945. Men returning from the armed forces made up the most important source of the increase. Yet despite the increase, the farm population is still nearly 9 percent smaller than it was before the war. Largely responsible for the decrease is the population decline on the still over-crowded farms of the South.

During the war the South's farm population was reduced by 3,287,000, or 20 percent. Heaviest losses occurred in Arkansas, Louisiana, Oklahoma, and Texas.

And since the war, fewer farm people have returned to these States than to any others in the South, leaving the region with over 10 percent fewer farm people than in 1940.

In replenishing its farm population, the South has shown a net increase of 1,673.000 births over deaths between 1940 and 1947. But its net migration figures show a loss of 2,968,000 for the same period. As of January 1, the farm population of the South stood at 14,576,000, or over 52 percent of the total farm population of the nation.

Tell It to the Children

Any long-range fire prevention program that is to produce maximum results must include fire instruction in the schools of America—both urban and rural.

Traffic safety has long been taught in thousands of schools. Fire safety deserves equal attention. As one authority said, "It is apparent that if safety education in the field of fire prevention had been adequately presented in the elementary schools during the past fifteen or twenty years, the loss of ehildren's lives from this cause would be greatly reduced today."

The methods used to teach fire prevention may be of various kinds. Periods of time may be allotted to it, or it can, in many cases, be combined with subjects which are an established part of the eurriculum. Regardless of method, the main thing is that the instruction be vivid and forceful—and really drive home the fundamentals of fire prevention in young minds.

Fire prevention study should begin in elementary schools, and consist of lessons which are easily understood by very young children. In higher grades, more advanced material may be used, including instruction in fire laws and ordinances. Finally, in university instruction, mature students may be given technical information dealing with the more eomplex aspects of the fire problem.

The responsibility for putting such a program into effect belongs to school authorities everywhere. It should be started now, on a national scale, as a positive and continuous effort to meet an emergency condition.

Fertilizer Important in Strawberry Crop

A generous use of fertilizer resulted in the best crop of strawberries A. L. Cunningham of McCracken County has produced in his 26 years of commercial production, according to Farm Agent Joe Hurt. He totaled records on 390 crates of Blakemores grown on one and one-half acres. He limed his patch at the rate of two tons per acre, then fertilized it with 400 pounds of phosphate and 200 pounds of 4-12-8 mixture to the acre.

Get Ready for Winter

Summer and early fall are the times for preparing homes for winter, with especial attention paid to the elimination of fire hazards.

One of the major causes of home fires is defective heating units, ranging all the way from oil stoves to central heating systems. Even the best of appliances become worn. Flues and chimneys become filled with soot. During the war, it was often impossible to adequaely maintain heating plants due to shortages of parts and labor. There are still shortages, but not as severe as in the immediate past. The money spent will pay tremendous dividends in safety and security.

Faulty electric wiring is still a major destroyer of homes. Important repairs should be made by a qualified electrician. Frayed eords sheuld be replaced. Then, when your electrical equipment is subpected to the heaviest use, it will safely earry the load.

Lastly, during the pleasant weather, homeowners should carry on a rigorous campaign to rid their property of junk. Thousands of fires have originated in attics and cellars and closets filled with old clothes, furniture, magazines, etc. Many fires have resulted from improper storage of plant, gasoline and other inflamables. A clean and orderly house offers fire few opportunities.

It Can't Be Done

Who's worried about high prices? You, the consumer, naturally are. And you are'nt alone. So are the manufacturers who produce the goods you buy. And so are the retailers who sell them to you.

Retailing in general has held to a eonsistent policy during postwar priee inflation. The policy was developed by the chain system, and thousands of independents of all kinds and sizes have voluntarily adopted it. It eonsists of increasing operating economy to the highest possible level. to holding unit profits to the lowest point consistent with sound business practice, and to raising prices only when higher wholesale prices make it unavoidable.

Other innovations are also being used in an attempt to help the hard-pressed consumer. Many food retailers, for instance, are offering plainly-marked, lower priced meat and are featuring alternate foods for buyers who cannot afford Grade A prices. Merchandisers in other lines are performing similar services.

A retail association reports that fewer consumers are blaming stores for high priees than in the past. That is a healthy sign, and shows that the public is learning an important lesson. High prices are the result of many eauses, some extremely complex, and to lay the blame on any group or any organization is unjust. It is especially unfair in the case of retailers, who eannot control wholesale prices, and must pay the going rate for their stock of goods. Every intelligent retailer would like to slash his prices now—but it just can't be done.

Newspaper Release on State Short Course 1947

The annual State 4-H Conservation and Short Course for Negroes was held on the A. & I. State College Campus, August 6-9, 1947, with an attendanee of 320 4-H Club boys and girls, leaders and agents.

The Program consisted of Conservation, Citizenship, Landscaping, Health and Etiquette, Dairying, Breadmaking, Craft, Reereation and a State Dress Contest for girls.

This was the largest Short Course held to date. and much interest and enthusiasm were exhibited on the part of the 4-H'ers, their leaders and agents.

The 4-H Short Course and Camp which was held at A. & I. State College was attended by 17 boys and 18 girls from Davidson County, and one leader. All club members expressed themselves as having enjoyed the Short Course and a request was made by McKinley Rucker of Mt. Pisgah community on behalf of Davidson County club members for a **longer-time camp.** Other requests by club members to be added was softball, competitive judging of plants and field crop seed.

Farm Talk with Farm Folk

By Jesse Safley

Very frequently, we read or hear of someone paying exorbitant prices for various types of livestock. Just this week, a fellow in California paid $35,000 for a Hereford heifer. While that is the highest price ever paid for a female Hereford, similar events are occuring all over the nation.

There was a tie when such practices were confined to horses. It wasn't unusual for a rich man to pay thousands of dollars for a race horse. However, he was usually an outsider who came into a locality, made a purchase, and nothing more was heard from him. In recent years. that practice has slowly moved into other fields of agriculture, especially in beef and dairy cattle.

We have questioned for a long time the effect of such practices to our agricultural program. We are sure that there is room for improvement in the average farm livestock, but it is hard to see how this will do the job. In the first place, high prices, (priees in the four and five figure bracket,) are paid by people who have all the money they desire, who do not have to depend on their investment for a living and in many eases know very little about the animals in question. They take advice from someone else, for a while.

Here is the problem as we see it. Men who have made money from some source other than agriculture will stop at nothing in securing the animals they desire, once they become interested in them. By doing so, they deprive some farmer who has the time. ability, and desire to breed quality livestock for a livelihood from owning quality animals. Instead, they are forced to purchase lower grade animals around which to buid a business.

Too often the rich man finds after a few years he is no longer interested in livestock. After changing managers and herdsmen a number of times, he decides to take his loss, if any, and go out of the business. During those years, the livestock that at one time were very desirable have received poor treatment and have failed to develop as they should.

Now, there are those who say no one has been hurt. That may be true, but we can't agree. In the first place, had some farmer who knows his way around in agriculture purehased the same animals he would have made a definite contribution to the breed and to other herds in the community.

It would be just as reasonable for a farmer to attempt to go into a complicated business if he had the money as it is for most rieh men to undertake farming. There is no business more detailed and more compliecated than farming and because a man has the money to purchase a farm and high priced livestock does not mean he is a farmer. as many are told to believe.

Now, there are some men who farm as a hobby that are making definite eontributions to agriculture, put they are more an exception than a rule.

We believe breed promoters make a mistake when they allow and encourage the selling of breeding. stock at prices above the finaneial standing of the average breeder. We may be equally guilty in giving publicity to those who go out on a limb and pay unreasonable prices for animals which should belong to someone who will properly care for them.

Breeders and promoters of various types of ivestock could do no better than to promote their livestock among the smaller farmers. That practiee is followed by some in working with junior breeders, but that is not enough.

Real progress will never be made in our dairying and beef programs until more people start working together rather than individually. There is too much selfishness among many breeders. If they can't have the prize winning animal this year, they go out and spend large sums of money for other animals with which to compete or else, attempt to discredit the animals owned by a fellow breeder.

Our advice to the laboring farmer is to continue to hold a level head when buying cattle in competition with those with a larger source of income. Take advantage of every reasonable opportunity which will enable you to own better quality livestock, but don't let anyone fool you into going into debt now to purchase expensive livestock.

Each year about this time farmers can look about their farms—at the crops and pasture—and realize they have again failed to do many things they promised themselves last year they would not let slip. Some of those jobs which went undone will in the long run cost the farmer several dollars, while others will only add to the amount of labor they are forced to have done during the past hot August days.

It is serious enough for a farmer to fail to do a job yet realize it should have been accomplished, but it is still worse when the jobs go undone and the man fails to realize the work was neglected. An example of what we have in mind: the many acres of corn left too thick in most every county we have visited. Leaving too many stalks of corn to the row would not prove so costly had the amount of rains we experienced in the earlier growing season continued, but with a few weeks of dry weather when the temperature is high the results are quite different.

Many farmers fail to realize that one stalk of corn in each hill will produce much more grain on our average corn land than will two. Although prospects for a good crop may look very favorable when the season is cool with an excess amount of rain, that picture ean change after it is too late to make any effective adjustment. Also, there are those who still have the idea that their soil is rich enough to produce corn without the use of fertilizer. That may be true in some cases but the more progressive farmers have found that the added push commercial fertilizer given corn will make a noticeable difference when the crop season varies.

Elsewhere on this page is a photographie view of a field of eorn being produced on bottom land. One can readily see that fertilizer makes a vast differenee.

Another job which we see many have failed to do again this year is to provide some type of temporary pasture to supplement their permanent pasture during that part of the season when perennial grasses are more or less dormant. Although we have experienced an unusual pasture season this year, there are many acres which are becoming short and showing brown following the past few days of hot dry weather.

Also on this page is a picture of a temporary pasture of sweet sudan grass on the farm of a Marshall County dairyman. Whether it is a dairy, beef or sheep farm, supplement pastures will increase the financial returns from eaeh.

It isn't really diffieult to have pasture of this kind. Although some labor is required, the important factor is doing that work at the time it will prove effective in the farming program.

It is surprising—the number of farmers one sees cutting wood for cooking even though the thermometer has been registering in the high nineties. We would wager those same fellows have said on numerous occasions they would have a supply of wood before August rolled around again. But August comes, the wood pile is gone and eooking must be done. so all that is left for him to do is shoulder the axe regardless of the temperature.

It is doubtful if there is a farm family anywhere that eould not make use of a good garden and it is true that almost all have good gardens during the spring and early summer, but just as sure as the weather gets warm the garden begins to grow up in weeds and soon there is no garden to contribute to the weekly grocer bill. It is not a case of jobs: there are few fall gardens simply because people fail to realize when various jobs should be completed.

There are many other things which go undone each year on the farm for the same reasons. It takes a little planning ahead in order to be ready to do all the things at the right time. It is never too early to plan. Why not make a list of those things you can see about you that should have ben done and be ready when the time comes next year?

What has happened to many of the eommunities which stood high in the Community Improvement Contest the first two years. We have visited in a number of those communities. recently and find that things are not as they were.

In some cases the chureh and school grounds are filled with weeds knee high or higher, indicating the yards have not been mowed during the entire season. Fence rows which were eleaned out are beginning to look like rabbit patches again. Mail boxes which have been knocked over are still leaning and the roadsides are littered with paper.

What has happened? The prize money is more than ever, members of the Nashville Farmers' Club are as enthusiastic as ever and you stand as much chance as anyone to win.

Make the Farms Hum

By Grace Armstrong Allen

Speaking of mistakes (we were, you know), we certainly made a bad one last month. We returned some wet extracted supers too early and started robbing. Absolutely inexcusable. We had finished a little picnic supper on the hill and it seemed late enough, so we just set the supers on. Promptly the bees got excited and also got busy. So did we. We smeared crude carbolic along cracks, and contracted entrances. It seemed as though it would never get dark.

We're not trying to blame our folly on daylight saving time, however, or even on the four-foot rattlesnakes with five rattles and one button which had been killed nearby just before supper. It was just our own inexcusable mistake.

We mentioned laying workers, too, last time. Some one wants to know why and when workers lay, and how you can tell.

Normally worker bees do not lay eggs. They do all the other work, but leave egg-laying to the queen, so well provided by nature with highly specialized organs, But if a colony becomes hopelessly queenless and stays that way long enough, workers may start to lay.

Suppose. for instance, a hive has cast a swarm. Temporarily they are queenless, but not hopelessly so because they have queen cells. But suppose the first young queen out destroys the others. She often does. Then suppose she sails out in her mating flight and a summer tanager catches her. Finis.

That colony not only has no queen, but has no eggs or larvae to raise one. They are hopelessly queenless. Unless the beekeeper discovers their plight (as of course the idea beekeeper does but the real one sometimes does not), they are doomed.

After a period of—oh, perhaps a few weeks, a few workers may start to lay. (They may. They don't always.) It is a sort of desperate effort to do something about a desperate situation. But the effort is necessarily futile. The reproductive organs of the workers are rudimentary, only partly developed. Incapable of mating, they can only lay unfertilized eggs. Although these will hatch, they always produce drones.

If, the beekeeper examines this colony. he will find eggs in irregular patches, prehaps several aggs haphazard in one cell, and the sealed larvae will be too tall, being drone brood in worker cells, all rough and protruding and "bullet-like." And he will recognize with a sinking heart that he has laying workers. And a eolony scarcely worth trying to save. Tney are almost certain to kill any queen given them, for laying workers make a colony very difficult to requeen. Not every one will agree, but personally I wouldn't even try.

About a month ago I was in Western North Carolina for a few days. Not only were the mountains beautiful, as always, not only was rhododendron in its glory, but to thrill the heart of a beekeeper sourwood was in full bloom. Every day for a week I stood under a certain tree to enjoy the white bloom, so like stiff-stemmed lilies of the valley, and also to listen to it humming in the sun.

Unfortunately there was no beekeeper there in Montreat to show me his bees and talk excitingly about crops and prospects. Just before starting home, however, I spent part of a day with friends in Biltmore, the lovely green village of grass and trees and winding roads, near Ashville. At lunch I sighed gustily because there had been no beyard on my trip.

When we rose from the table, the gracious mother of my hostess led us through the wide open dining dining room doors, across a broad green lawn at the rear, under great forest trees, and around tall clumps of shrubs that suddenly opened to reveal a neighbor's almost hidden vegetable garden. There were flowers there also, for eutting, many of them in bloom, and—oh joy, at the far end a row of 15 white beehives gleamed against a tall dark hedge. We exclaimed at the unexpected, almost old-world beauty, my hostess as surprised as I.

A substantial gray-haired man greeted us cordially. He had been the gardener of the estate for many years and admitted he was also the beekeeper, though insisting he enjoyed the bees more than he understood them. He had already extracted a rather generous early crop, he said, a blend of locust, basswood, and espeeially tulip poplar. "And they were working sourwood," I say happily. How they were working!

"Yes the gardner repeated in a tone too contented to be merely matter-of-fact, "now they're working sourwood." The others had stopped before reaching the bees and were wandering the garden paths. Two Negro men were working among the flowers. We two talked on there among the humming bees—simple, rather unimportant, bee talk, about methods of supering and one odd-shapped hive he had and the fact that sourwood makes one of the finest and most famous of all honeys. The day was bright and beautiful and made memorable for the Tennessee visitor by this bee talk among those well kept hives where the bees were working sourwood.

White clover held on rather late in Middle Tennessee. White sweet clover, too, though there wasn't much of it. On the last Saturday in July I watehed bees on white sweet clover, fading and drying up, and also on buck bush, just eoming into bloom. Smartweed is blooming, too, and probably other minor sources that sometimes add up to a sizable total. But what will this heat do to our nectar plants,

Unique Breed Record Reported in New York

Milkdale Aristoerate Rag Apple, a Holstein—Friesian bull in the service of the New York Artifical Breeders Cooperative is credited with a potential of over 10,000 offsprings. The animal was put into service by the cooperative in December of 1944.

His first 10 daughters to complete one or more DHIA records produced an average of 15,099 pounds of milk with a 3.6 per cent butterfat test, over a period of 305 days. This represented an increase of 664 pounds of milk and 46 pounds of butterfat over the dams, aceording to the New York Holstein-Friesian News.

WOMAN'S PAGE

Helpful Household Hints

EASIER CUTTING

To cut meringue that is especially sticky, use a knife coated lightly on both sides with butter

Keep a box of small toys and trinkets in the car to entertain children on a long drive or when visiting friends who do not have toys available.

FROZEN LEMON PIE

1 cup evaporated milk
3 eggs, separated
½ cup sugar
¼ cup lemon juice
½ teaspoon grated lemon rind
4-ounce package vanilla cookies, crushed

Prepare milk for whipping by placing in refrigerator tray until ice crystals form around the edges. Meanwhile, beat egg yolks slightly, combine with sugar and lemon juice and cook in top of double boiler until thickened. Add grated lemon rind and cool. Fold in egg whites which have been beaten stiff but not dry. Whip milk very stiff in cold bowl with cold beater. Fold in lemon mixture lightly. Line a quart freezing tray (or two pint trays) with crushed cookies, reserving a portion of the crumbs for topping. Pour custard into tray and sprinkle remaining crumbs on top. Freeze in refrigerator set at coldest point. Yield: 8 servings.

RIPE PEACH CONSERVE

4 cups prepared fruit
7½ cups sugar
½ cup chopped cherries
½ cup finely chopped nutmeats
1 bottle fruit pectin

To prepare fruit, peel off the yellow rind of 1 medium orange and 1 medium lemon with a sharp knife, leaving as much of the white part on the fruit as possible. Put yellow rinds through the food chopper twice; add ¾ eup water and 1-16 teaspoon soda to ground rind, bring to a boil, and simmer, covered, 10 minutes. Cut off the tight skin of the peeled fruit and slip the pulp out of each section. Add pulp and juice and the juice of an additional lemon to the rind, and simmer, covered, 20 minutes longer. Peel about 1½ pounds fully ripe peaches. Pit and grind or chop very fine. Combine fruits

To make the conserve, add sugar, cherries, and nuts to prepared fruit in large saucepan, filling up the last cup with water if necessary. Mix well. Bring to a full rolling boil over hottest fire. Stir constantly before and while boiling. Boil hard I minute. Remove from fire and stir in bottled fruit pectin. Then stir and skim by turns for just 5 minutes to cool slightly, to prevent floating fruit. Pour quickly. Paraffin hot conserve at once. Makes about 12 glasses (6 fluid ounces each).

Escarole is a very sandy vegetable and, therefore, should be carefully washed when preparing. It is used primarily as a salad ingredient or a garnish, but it may be cooked as you would spinach. Escarole also goes well in soups, souffles, pancakes and many other dishes.

PEPPER RING TID-BIT

Cut green pepper across in strips to form rings, place on buttered crackers. Spread caviar inside of ring. Place ring of egg (white) on top with rolled anchovies. Add a few drops of lemon juice.

EMERGENCY ITEM

A jar of dried beef on the shelf is a life-saver for emergency meals. Try a casserole of boiled noodles, shredded dried beef and cheese sauce. Good for lunch, dinner or supper.

Is Hard Water Your Problem?

One of the chief problems confronting the homemaker is that of water. Types of water vary in the different sections; in one place, it may be soft or comparatively soft, and in another area, it may be so hard that it seriously affects the laundering problem.

In hard water, curds are formed when the mineral salts unite with the soap. Then the dirt particles combine with these curds and work their way into the textile fibers. Hard rubbing to remove the grayness eventually breaks the fiber and tears the cloth; besides, this entails a lot more work in the laundering of fabrics. Because hard water so often does an improper and insufficient type of cleaning, it is often responsible for dulling the hair, staining teeth, clouding glassware, making unsightly stains on porcelain sinks, and leaving the too-familiar and always ugly ring on the bathtub. Hard water also corrodes the piping, corrodes the coils and tanks of your water system, and makes water heating more expensive.

Therefore, one of the most persistent problems confronting the housekeeper is the softening of water. Of course, a water softening system can be installed; but this is not always possible. If such a system is put in, though, be sure to have an analysis made first, to determine the hardness of the water. There are a number of good water softening agents on the market, packaged commercially. These you will find to be most effective. The use of washing soda is an inexpensive method, also; for moderately hard water, one pound of the soda should be completely dissolved in a quart of water and two tablespoons of this used for every gallon of water. Be sure that it is carefully dissolved. Lye is cheaper than washing soda, but it is so exeessively alkaline that it cannot be safely used for this purpose. Ammonia solution can be used. However, so-called household ammonia is often a very weak solution, and it may be more economical to buy concentrated ammonia solution from a druggist and dilute it according to need. Do this carefully, though, and out-of-doors, as concentrated ammonia solutions are unpleasant to handle.

While most people deal with hard water, there are certain minerals and acids that ean also spoil soft water. Scale or corrosion can occur in either type of water. So-called "red water," which is unpleasant for drinking, cooking, or washing, and which stains fabrics, may be caused by dissolved iron in the water or corrosion in the plumbing.

Acid water may be decaying your equipment. This condition may be detected by the following symptoms:

Rusty-looking water and red stains on sinks and tubs; ugly brown stains on home-laundered fabrics; poor flow of water from faucets; greenish or bluish stains on enamel sinks and tubs; bluish cast to water when soap is added; specks of sediment in water, and metallic taste of water.

To control these effects of soft water, it may be necessary to install a water neutralizer of the tank type or by installing a smalled fixture or feeder on the water inlet to your home.

As you know, an ounce of prevention is worth a pound of cure. Guard against too much hardness and too much softness; both are detrimental. Washing or sal soda is probably the most satisfactory hard water softener for household use; this may be of help to you in combatting the hard water in your household tasks.

If you have already accumulated stains on sinks, tubs, basins, etc., from too acid-water, these stains may be cleaned by using ¼ cup kerosene and 1 cup of soda. These are combined to form a paste which is applied to the surface with a cloth. Afterwards, wash the sink with soapy water and rinse well. Yellow iron stains on vitreous china fixtures may also be removed by a sparing application of hydrochloric acid or an oxalic acid solution (1 teaspoon oxalic acid to 1 cup hot water). However, wash off at once!

SKILLET MEAT LOAF

1 (No. 2) can corned beef hash
2 tablespoons chopped green pepper
¼ cup chopped onion
3 tablespoons chopped celery
1 cup soft bread crumbs
1 egg, beaten
1 teaspoon salt
1 teaspoon catsup
1 teaspoon Worcestershire sauce
¼ teaspoon prepared mustard
1 tablespoon fat

Combine all the ingredients except the fat. Melt the fat in a medium-sized skillet. Add the meat mixture and press down with a spoon to form the shape of the pan. Cover and cook over low heat for about 20 minutes Turn out onto a hot platter and garnish with sliced tomatoes Makes 4 servings.

TONGUE AND BEET SALAD

1 envelope plain unflavored gelatin
¼ cup cold water
1 cup cooked sliced beets
1¾ cup water
¼ cup vinegar
1 teaspoon salt
Dash pepper
1 tablespoon minced onion
2 tablespoons horseradish
1 tablespoon sugar
1½ cups diced cooked tongue

Soften gelatin in ¼ cup cold water. Combine in a saucepan beets, 1¾ cups water, vinegar, salt, pepper, onions, horseradish, sugar. Bring to a boil. Remove beets and save. Add gelatin to liquid, stir until dissolved. Chill. When mixture begins to thicken fold in sliced beets and tongue. Turn into a large or individual molds that have been rinsed in cold water. Chill until firm. Unmold on salad greens. Serves 6.

ORANGE MARMALADE BREAD

¼ eup shortening
½ cup orange marmalade
1 egg
2 cups all-purpose flour
3 teaspoons baking powder
½ teaspoon salt
¾ cup milk
½ cup chopped walnuts

Cream shortening and marmalade thoroughly. Add slightly beaten egg. Sift together flour, baking powder and salt. Add to marmalade mixture alternately with milk. Stir in chopped nuts Pour into greased 8x4 loaf pan. Bake about 50 minutes at 375 degrees.

BUTTER CREAM ICING

1 box confectioners sugar
¼ cup butter
1 egg white
¼ tsp. salt
¼ cup milk
1 tsp. vanilla

Sift sugar into mixing bowl. Add egg white and salt. Beat well. Add milk. Beat until fluffy. Add vanilla.

The following frosting may be kept on hand.

APPLE PIE

Mix 2 tablespoon flour, 1 cup sugar, ¼ teaspoon allspice, ½ teaspoon nutmeg and 2 tablespoons marachino cherry sirup; sprinkle ½ cup in 9 in. unbaked pastry shell. Add 5 eups sliced pared tart apple, sprinkle with remaining sugar mixture. Dot with butter or margarine. Cover with pastry strips, lattice style; flute edge. Bake in hot oven, 425 degrees F., 40-45 minutes. Garnish.

SANDWICH LOAF

2 slices white bread
2 slices whole wheat bread
Pimiento cheese
Olive and egg mixture
Sliced avocado pears

Slice bread 1-3 inch thick and trim off edges. Butter. Spread first slice with thick layer of pimiento cheese. Top with second slice of bread, spread with mixture of olive and egg minced finely and mixed with mayonnaise. Top with third slice of bread and carefully arrange slices of avocado pears seasoned with salt and lemon juice. Top with fourth slice. Chill in refrigerator and slice.

LAYER CAKE

1 cup soft butter or shortening
1½ cups sugar
3 cups cake flour
4 tsp. baking powder
½ tsp. salt
¾ cup milk
1 tsp. vanilla
6 egg whites beaten stiff

Cream butter or shortening. Add sugar gradually and cream thoroughly. Sift and measure flour. Add baking powder and salt. Combine milk and vanilla. Add dry ingredients alternately with milk. Fold in egg whites. Bake in layer cake pans in 375-degree oven 30 to 35 minutes.

CRANBERRY-ORANGE PIE

Bring 1½ cups sugar and ¾ cup water to boil. Wash 3 cups cranberries; add. Cover; slowly boil until skins break. Mix 2 tablespoons cornstarch with cold water; add; cook until thickened. Add 2 tablespoons butter or margerine, few grains salt. 2 teaspoons grated orange rind and 1 1cup membrane-free orange sections; cool. Pour into 9 in. baked scalloped pastry shell; cover with 7 in. baked scalloped pastry circle.

REFRIGERATOR FROSTING

2½ cups sugar
½ cup water
½ cup light corn syrup
2 egg whites
2 tbsp. sugar
2 tsp. vanilla

Cook 2½ eups sugar, water and corn syrup together until firm ball is formed when tested in cold water or to 242 degrees F.. Beat egg whites. Add 2 tbsp. sugar and beat thoroughly. Add syrup slowly. Beat until mixture will hold its shape. Add vanilla. Spread on cake or store in tightly covered jar in refrigerator.

LAMB PATTIES WITH VEGETABLES

Skewer thin bacon slices around lamb patties. Place on broiler rack with top of food 3 inches below unit or tip of flame. Broil 10 to 12 minutes, turning once. Serve from heated chop plate with hot "buttered" broccoli, also whole kernel corn, drained, seasoned with minced pimiento, salt, black pepper and sauteed in bacon fat.

FRUIT MERINGUE COOKIES

2 egg whites
2-3 cup Karo
1-3 cup-all-purpose flour
½ teaspoon salt
½ teaspoon cinnamon
¼ teaspoon vanilla
½ cup raisins
½ cup chopped maraschino cherries. well drained
½ cup chopped nut meats
2 cups ready-to-eat cereal flakes (wheat, rice or corn)

Beat egg whites until stiff. Add Karo (Red or Blue Label) 2 tablespoons at a time, beating well after each addition. Sift together flour, salt and cinnamon. Fold into beaten egg whites, then fold in vanilla, fruit, nut meats, and cereal. Drop from a tablespoon onto a greased baking sheet and bake in a moderately slow oven (325 degrees F.) 25-30 minutes. Makes 40-50 small cookies.

CREOLE TOMATOES

2 cups tomatoes
2 hard-boiled eggs, diced
½ cup cracker crumbs
2 teaspoons sugar
¼ teaspoon paprika
2 tablespoons chopped onion
½ cup ripe olives, chopped
2 tablespoons butter

Mix ingredients and pour into a buttered serving dish. Bake 20 minutes in a moderate oven. This is a just-right "something hot" between a chilled fruit and chilled dessert for a hot day luncheon.

For other days serve a STUFFED TOMATO SALAD with a hot soup or a hot fruit cobbler.

Wash and peel 6 large, firm tomatoes, cut out blossom ends, scoop out part of the pulp and chill. Mix the pulp, ½ cup each diced celery and cucumber, 2 tablespoons chopped sweet pickles, 2 diced hard-boiled eggs, ½ teaspoon salt, ¼ teaspoon paprika, and 1 cup shrimps, with mayonnaise. Stuff the tomato cases and serve on beds of lettuce with a generous garnish of mayonnise.

BROWNIES

½ cup butter
1 cup sugar
2 eggs
¾ cup flour
¼ tsp. salt
½ tsp. baking powder
2 squares chocolate (melted)
1 cup walnuts
1 tsp. vanilla

Cream butter and sugar together. Add eggs. Beat thoroughly. Sift flour, add salt and baking powder and sift again. Add to creamed mixture. Add chocolate, walnuts and vanilla. Pour into well-greased pan and bake. Cool and cut into squares.

MOCK MINCE PIE

Combine 5 cups chopped pared tart apple, 1½ cups firmly packed brown sugar, 2 tablespoons vinegar, ¼ cup water, 1½ cups seedless raisins, ¼ teaspoon cloves, ⅛ teaspoon allspice, ¼ teaspoon nutmeg and ½ teaspoon salt; slowly bring to boiling point; simmer 40 minutes, stirring. Pour into 9 in. unbaked pastry shell; cover with pastry with heart shaped pieces cut out; make fancy edge. Bake in hot over 425 degrees F., 30 minutes.

TOMATOES STUFFED WITH EGG SALAD

4 firm well-shaped tomatoes
4 hard-boiled eggs
½ cup diced celery
2 tablespoons salad dressing
½ teaspoon Worcestershire sauce
1 tablespoon or more lemon juice
Salt and pepper
Frizzled dried beef, or crisp diced bacon

Remove skins and the core from chilled tomatoes. Cut in 5 or 6 sections and press open gently to make a flower. Sprinkle inside with salt and pepper. Place on salad greens. Meanwhile chop eggs, not too fine. Add celery, salad dressing, Worcestershire sauce and lemon juice. Season well to taste. Spoon into cented of tomato. Top with additional dressing, then the dried beef or crisp diced bacon.

BRIEFS

Additional impetus for the compaign to eliminate foot-and-mouth disease in Mexico was pledged by both United States and Mexiean members of the joint commission conducting the eradiction work at the close of their two-day conference last week.

The number of young chickens on farms in 1947 is estimated at 742,-047,000 birds. This is about the same as a year ago, but 3 percent less than the 1936-45 average.

APPETIZER

Combine sauerkraut juice half and half with tomato juice. This is an appetite stepper-upper.

THE MODERN FARMER

VOL XX. NASHVILLE, TENN., NOVEMBER 15, 1947 No. 10

THE BYRD NEST

By Rev. Bernard O. Byrd

—Guest Columnist.

GO DEEPER WITH THE LORD

A lower, second, and third story shalt thou make in the ark, said God to Noah as he gave the final instruction for the construction of the ark. To the ordinary person of today, especially to them that have had no experience aboard ships, the expression, "Lower, second, and third stories" seems peculiar, but all followers of Christ know that God never makes a mistake in his expressions. In the ark, the top story is the first story. From the top story, one goes down because entrance is made at the top.

It might be well to say here that a man should never tie up with anybody or anything unless he can go places with him or it. Many marriages are failures only because either a man married a woman with whom he could not go places or make advancement, or perhaps a woman married a man with whom she could not go places In some instances people may be able to go certain distances, but because of the inability of one cannot go very far. We may apply the same reasoning to our jobs. Some of the jobs which are pursued by men will never get them very far. Each person should strive to enter a vocation which has a great future, and then he should put forth his best efforts to bring about the advancement possible. Perhaps many ministers of the gospel will not agree with me when I say that it is possible for a minister to be pastoring a church with which he cannot go places. The above statement does not mean that such a minister could not make any kind of progress with a limited congregation, but it does mean that the congregation sometimes cannot go as far as the minister can lead while it is true that a minister of the Lord can do some good wherever he stops and works, but it is impossible to lead some groups into the fullness of a great vision. In such a case, the minister is losing time because some other man might be able to carry that congregation the extent of its ability whereas the highly qualified, spirit-filled minister with a great vision could go much farther with a group which also could perceive with the minister the great vision.

The leader cannot carry a group of followers any further into the depths of spiritual realities and accomplishments than their eyes can behold. Perhaps one among the more discouraging things that a leader can face is a congregation of people which cannot see with the leader and which will not follow by faith the vision which God has given the leader. The ability to go means nothing when the man cannot see where or how to go. As a train rolled in front of a railroad station, within the station, there stood a blind man calling, "Someone please put me on the train." He could walk to the train, and could carry his bag, but could not see where to go. He did have faith, however, to follow the leadership of one who said, "I will lead you to the train." In most cases, congregations of people with abil-

Sharecropper Increases Income $1,400 Through Curb-Market Sales

Display High-grade Products At Curb Market

Mr. and Mrs. Charles Ruffin, right, North Carolina sharecroppers, display high-grade home-grown products on their stand at the Wilson, N. C., curb market which the colored county agent, Carter W. Foster, helped the farmers in his county to establish. Note the ham which Mr. Ruffin is showing Extension Service Field Agent John W. Mitchell and State Agent R. E. Jones, who heads agricultural extension work with colored farmers in North Carolina.—USDA Photo 7-14-47.

Wilson County Farmer Adds To His Income By Selling Home Town Products

Washington, D. C.—Charles Ruffin, a colored sharecropper of Wilson County, N. C., added $1,400 to his cotton and tobacco income last year by selling home-grown products at the Wilson curb market.

"My wife and I were worried about the education of our children a few years back," said Mr. Ruffin when interviewed recently. "That was before our county agent helped us start this curb market; now we are not worried at all," he added.

And why should they be. Four of their children already are going to college— three daughters at North Carolina College in Durham and a son at A T. College, Greensboro, N. C. And the way is paved through curb market sales for the other five children to enter college when they finish high school

Mr. and Mrs. Ruffin began farming as sharecroppers in 1923. Year after year, until 1941 they grew only cotton and tobacco for market and could never seem to get ahead. In May of 1941, County Agent Carter W. Foster helped the farmers of Wilson County to organize an association and establish a curb market.

On the opening day of the market, Mrs. Henrietta Ruffin and eight other farm women sold only $53.87 worth of products. Last year, the sellers at the market sold $10,657.89 worth of vegetables, fruits, cured meats, eggs, poultry, butter, flowers, and miscellaneous products including home-made soap. Of this total, $1400 went to the Ruffins to help educate their children and to help swell their modest savings for a farm of their own. In a single day they have sold as much as $94 worth of products at the curb market.

"When land prices come down

Liberty County Home Demonstration Council Held Good Meeting In September

The Liberty County Home Demonstration Council met at the local club camp on September 29, for its fourth quarterly meeting of 1947. The Council officers are—Mrs. L. R. Frasier, Pres.; Mrs. Maggie Williams, Vice-president; Mrs. Sylvania Smith, Secretary; Mrs. Ida C. William, Treasurer; Mrs. Emma Holmes, Reporter; Mrs. Alma Jackson, Recreation Chairman; Mrs. L. Finnell, Deputy.

The high lights of the meeting were the plans and information for our Annual Harvest Festival that will be held at the Liberty Recreational Center on November 20-21, 1947. Our theme for the program shall be "Reducing High Priees

Twenty Million Freedom Gardens Are Urged For Goal In 1948

Secretary of Agriculture Clinton P. Anderson said last week that the Nation's home gardeners can continue to help meet the critical world needs for food.

Pointing to the wartime record of white and colored home gardeners, the Secretary said, "The substantial contribution home gardeners can make in increasing the domestic food supply was proved during the war years. Their help will be enlisted again for the year ahead when many areas of the world will be desperately in need of food.

"As a beginning, white and colored gardeners in the South should make full use of their home and

27,000 White And Colored Veterans Get Farm Loans Through F. H .A.

Over 27,000 white and colored veterans received farm ownership and farm adjustment loans last year through the Farmers Home Administration of the U. S. Department of Agriculture, according to year-end summary of the agency's loan activities.

A breakdown of the loans to veterans shows that 23,654 received a total of $30,159,937 in adjustment loans to help them get their farming operations on a sound footing, and 3,200 received loans to either buy, improve, or develop a family-type farm of their own.

Over-all 183,000 loans, totaling $137,700,000, were made to farmers last year by FHA. Of these, 28,-

Secretary Of Agriculture Anderson Say Farm Machines Are Competing With Farmers

"Our machines are competing with our people, and many of our people are losing," said secretary of Agriculture Clinton P. Anderson last week in his testimony on long-range farm policy before the House Committee on Agriculture and Sub-committee of the Senate Committee on Agriculture and Forestry.

"Millions of farm people continue to be underemployed, unable to keep up in the mareh of technology," Anderson stated. "The purchasing power of many farm people is still relatively low. The size of the family-sized farm can change as mechanization alters the cost of farming.

"Time works against us in meeting these problems," he continued. Our machines are competing with our people, and many of our people are losing. Time brings new efficieney and lower costs of production for some farm people; for others, time brings only the need for opportunity outside agriculture."

Turning to prices and surpluses. Anderson said. "It seems to me that efforts to maintain a floor under consumption must be an essential part of our first line of defense against surpluses and low prices. conservation, research and education, marketing agreements, and an all-out effort to maintain foreign markets at a reasonable level are parts of the first line. Price supports and, where needed, marketing quotas and acreage allotments are essential of the second line of defense."

In discussing administration of Department programs, the Secretary said that we have felt the need to coordinate and consolidate functions at the State level and especially at the county level where our programs actually reach the farm family. We also want to encourage the greatest possible participation of farm people in the formulation and administration of programs.

Make the Farms Hum

By Grace Armstrong Allen

Did I hear a rumor about more money to be available next year for honey and bee exhibits at the State Fair?

Years ago, beekeepers' booths across the north end of the Agriculture Building made one of the most attractive and interesting features of the Fair. Money prizes, substantial enough to justify the hard work, were offered for many items—honey in glass, honey in comb, beeswax, equipment, bees themselves, etc., etc.—a long generous list.

That part of the building really hummed. Beekeepers met to talk, and visitors asked innumerable questions, with a good chance to see and learn. We hope the rumor is true.

I mentioned beeswax above. As stated in this column in September, wax is an important by-product of extracting. The honey can't be "slung" out of the combs until the cappings are sliced off on both sides. When the beekeeper starts his extracting, he has only one product to handle, sealed honey—perhaps two supers of it, perhaps 100 or more, stacked up in his honey house.

When he has finished extracting, he has three things to handle: The emptied combs, which will be used over and over, year after year; the honey which was extracted from them, his main crop, either for his table or the market or both; and the cappings, from which he may secure this small extra by-product, beeswax.

Let's look back. Hidden on the under side of the abdomen of the worker bees are four pairs of glands, which under certain circumstances will secrete wax. We often say that all the beeswax in the world has come from the bodies of honey bees. This is true, and no matter how often we say it, it still seems marvelous.

This wax exudes as a minute drop of liquid, which promptly hardens into a tiny scale. Then the legs get busy. Somehow one of the hind legs passes this scale forward to the front legs. Then the mandibles take it—those clever little jaws that move sidewise—and they work it into a nice soft condition and put it where it's needed, perhaps on the edge of new comb being built, perhaps as part of the capping being spread over cells where honey is all rich and ripe, waiting to be sealed.

So when our beekeeper has sliced off these cappings, he may let them drip and drain, then put them out in his glass-covered solar wax extractor, and let the sun melt them. Then early some morning, when the melted wax is hard, he—or perhaps his wife—may put it in a pan on the kitchen stove to melt again, then let it settle, pour it off most carefully (no sediment allowed) into a clean honey-smeared pan and cover it to delay the cooling and hardening process. And behold, a cake of bright beautiful beeswax, which may easily win a blue ribbon at some fair.

Within considerable variation, one thus gets—oh, perhaps two pounds of honey for each 100 pounds of honey extracted. There are other ways to render it, some and messy, some much more efficient with modern equipment. But these are time-honored methods for small producers.

Beeswax has many uses, comb foundation being of course the largest and most obvious. It is also used in various varnishes and polishes, in cosmetics believe it or not, and in candles, especially for religious services. Beeswax candles stand serenely straight even in warm weather, without bending over and getting shapeless as inferior ones do. It has other uses, too, and nearly always brings a good price, considerably more per pound than honey.

October's famous "bright blue weather" should send the delightfuly unpleasant odor of fresh aster nectar floating out from our bee hives.

For all our wishful sniffing, we could smell only plain ordinary air through all late September and even through the first few days of October. But later the exciting odor comes, although not strong, and in the hives was new nectar.

Davidson Coounty aster was late although not much.

coming into bloom and is evidently not yielding heavily. There is a tradition about aster in Middle Tennessee. It's really more than a tradition. It's a conviction. I, for one, respect it because of having first heard it from our great Tennessee queen-breeder, the late John M. Davis, famous for decades throughout this country and abroad. Yet, I must admit we have never kept close enough check to speak with authority.

When we have a hot dry August., followed by a rainy September, Davis used to say get ready for a good aster flow. (I think he meant even a normally rainy September.) Well this year, August was undeniably hot, though it was not especially dry. In fact around here our rainfall was 3.05 inches, which is not much short of the normal, 3.71 inches. Unfortunately, it was September which was dry and rainfall is very important. In Davidson County, instead of the normal 3.42 inches, we had less than half an inch of rain through all September.

Even what we in this area call a good aster flow generally gives us only winter stores. Very seldom do we get aster surplus here. I understand that it does much better in West Tennessee.

Some authorities claim that the entire aster tribe (of which there are more than 100 species in the U. S.) secretes nectar better when growing in acid soil. That doesn't mean us herewith our limestone soil. Perhaps that helps explain the better flow in other parts of the State.

It is because of the uncertainty of the fall flow that most of us leave plenty of honey with the bees when we take off the surplus for ourselves. In our own small yard, there was plenty even with no aster at all. Early this month we evened up stores a little, dividing the wealth by robbing Peter to pay Paul.

Someone has recently said that beekeeping is being recognized more and more as the spark plug of agriculture. The other day I read that Utah farmers, raising alfalfa other legumes for seed, are crying aloud for more beekeepers.

At the same time beekeepers in Northern California are crying just as loud against farmers who have treated large tomato fields with arsenical dusts. Applied from the air, these dusts go drifting so far that apiaries several miles away are not safe. And beekeepers in Iowa are viewing with suspicion DDT on corn fields. Bees don't get nectar from corn, but they do get pollen, and can you think what poisoned pollen might do to bees?

We all realize that economics and international relations are extremely complicated. What seems like good procedures from one point of view often prove disastrous in some other way. And now agriculture is getting like that. The new insecticides are powerful. But their use must be increasingly based on the fact that not all insects should be killed.

Honey bees are not only desirable, not only profitable, not only beneficial. They are vitally essential.

$5,000 Rose Patch

MITCHELL E. ERWIN, $10,000-a-year Texas farmer who doesn't rely wholly on any single crop, but who carries out a balanced farming program, is shown in his four-acre rose patch talking with his county agent, B. J. Pryor, right. Mr. Erwin expects to gross nearly $5,000 from his roses this year if all goes well.—USDA Photo—6-30-47.

Peach Tree Borers

Peach Tree Borers. October is the month to fumigate these pests. As nearly as possible make treatments October 5 in the northern third of the state; October 15 in the middle third, and October 25 in the southern third. The soil temperature on these dates is right for good results. See your county agent for particulars.

Plan to Save Seed

It's not too early to make plans for harvesting sericea, annual lespedeza, and crotalaria seed. S. R. Doughty, API extension soil conservationist, says that present indications point to a strong demand for these seed at good prices.

The farmer who allows water to make short cuts across his farm will eventually have to take the long way around a ditch.

Cultivate New Kudzu

Farmers should cultivate new kudzu plantings and if the crop did not receive fertilizer at planting, an application should be made when cultivating, advises S. R. Doughty, API extension soil conservationist.

Play Safe

When putting in electrical switches and outlets, do not locate them near bath tubs, washtubs, or sinks. Danger of electrocution lies in receiving a shock when a part of your body is in water.

Cow's Tale

Buffalo, N. Y., Sept. 2—(AP)—How much is a cow's tail worth?

Country Treasurer Frank A. Slade awarded $40 to Clifford Kelkenberg of Clarence Center after a dog, owner unknown, bit off three inches of the tail of a registered Holstein heifer. The money was taken from the "dog license fund" available to the county to pay claims of farmers whose livestock is injured by dogs.

Save Sericea Seed

Saving sericea seed means there will be more to plant next spring. Some seed to sell will bring in money when you need it to pay for fertilizer and other things. There will be a big demand for sericea seed next year.

The need is great and the need is now. Save food by observing "meatless" Tuesdays and by eating no eggs or poultry on Thursday.

The oldest U. S. citrus acreage is in California.

QUICK AND HEARTY

Add a little minced onion and parsley to seasoned mashed potatoes and put between two slices of luncheon loaf. Bake for 20 minutes in a moderate oven. One "sandwich" to a person makes a hearty main dish.

Florida Normal In Campaign To Raise Fund of $40,000

St. Augustine, Fla. — (Global)—The $40,000 campaign launched by President John L. Tilley of Florida Normal and Industrial College of St. Augustine, Florida on Nov. 1, is well under way. Funds being raised are to be used toward the erection of a dormitory for women faculty members.

Pioneer Hall, rich in tradition and one of the first buildings erected by President Nathan Collier on the present college site had served until its loss by fire, as the residence for women teachers. The need for replacement of this building is very great. Teachers must be housed temporarily in the dormitories with the student young women.

Of the colleges of the southwest, Florida Normal and Industrial College has one of the most picturesque campuses. Although a few temporary buildings are yet to be found, its spacious stucco buildings with their red tile roofs, typical of Spanish design, are a perfect compliment to the tropical setting. The new building for which the campaign is being launched will also be of this design.

President Tilley said that the necessity of adequately housing our teachers was close to the heart of Rev. John R. Evans of Miami, the Chairman of the College Board of Trustees. Dr. Evans has passed away since the beginning of the Fall term but his great spirit and earnest desire to meet this need are mirrored in the hearty response that this campaign is receiving.

Byrd's Nest

(Continued from page 1)

ities to do and go places have not been given the proper vision, and in most cases when they call a leader, they are calling one in whom God has placed the power of vision. Certainly if God has given the leader the vision the people should, like the blind man, trust the leadership of the man in whom God has invested the power of vision.

Men may have their difficulties in going deeper with men, but one can always go deeper with the Lord. Every man is personally responsible to God to make personal development even if many others fail to follow a good lead. Thousands may remain shallow with the surface thinking of men but such actions of many need not hamper the dives of another into the realm of understanding of wisdom and of power. There are unlimited depths in the knowledge, understanding, wisdom, and power of God but before men can enjoy their benefits, he must put forth an effort to go deeper with God. Jewels of scripture are found among men who sit waiting for someone else to reveal them, but are acquired by constant digging, digging, and more digging. Some persons attend conventional meetings mostly to hear and copy or memorize the diamonds of spiritual thought used in expounding God's word. Much good can be gotten from these things when taken in the right way. These valuable gems of expression, and powerful revelations should become incentives for digging rather than replacements for them. Surely if we are to go deeper with God, we must dig deep into the things of God. Let us hear and rehear the words of God ringing through the ages from Noah's time to this present moment advising us to make a lower second story of investigation into the eternal truths of righteousness and to make a lower, third story of acquisitions from the unfailing facts about the divine order of the universe.

The man who goes deep with the Lord grows, but the man who remains on the surface seldom developes to any great extent.

Notice that minnows which are almost valueless are top-water fish; while the valuable fish, the fish which grows bigger and more valuable spend most of their time in deep water. Value is placed on a minnow only when he is being used to catch big fish. Are you a shallow minded minnow, or are you going deeper with the Lord?

"Peace Or War In Palestine" Topic Discussed At Fisk

"Peace or War in Palestine" was the subject of a panel discussion between Pro-Arab Dr. Mahmud Mahanay of Damascus, Syria and Pro-Zionist Percy Cohen, Nashville businessman and former member of the National Council of Zionest Organization of America, on December 4 in the Fisk University International Student Center.

Dr. Mahanay is currently enroller at Vanderbilt University where he is studying Public Health. His opponent, Mr. Cohen has been president of the Nashville Zionest Organization for five years.

Ferdinand Mehlinger, Fisk graduate student in Sociology acted as moderator for the discussion. After the panel a public discussion was led by students from Dr. Jitsuichi Masuoka's Sociology class. The public was invited to the program and to the reception which followed.

A friend whom you have been gaining during your whole life, you ought not to be displeased with in a moment. A stone is many years becoming a ruby; take care that you do not destroy it in an instant against another stone.

Manners are invented to keep fools at a distance.

If Others Only Knew

Says Mrs. L. Shelman

Mrs. Laura Byrd Shelman, a faithful stand-byer in both Midway and Freedman Grove Communities is constantly inspiring many of her fellow club leaders to do a better job in homemaking. Each day she is making her home a more convenient and comfortable place in which to live.

Early this year Mrs. Shelman decided to improve her poultry projects which includes chickens, ducks and turkeys, that she might net something to solve her cooking problem. It was just last month that she purchased a new gas range and hot water heater, and says "I could not have made a wiser investment because now I have no wood nor smoke problems in my kitchen. each day my cooking time is cut almost 50 percent and I get out to work on time each morning after having a nourishing breakfast."

This homemaker among many in her eommunity has done a very good job in making the following improvements:

Repairing the yard fences
Building an attractive lawn
Painting the exterior of her home for life and beauty
Painting the interior of her home to make the rooms more attractive
Keeping her curtains clean and attractive.
Turning feed sacks into lovely scarfs, aprons, dish towels, garments, table runners and others.
Building a cement walk from door steps and a fish pond in center of her lawn

Says Mattie Pearl Mathis, Home Demonstration Agent, Liberty County.

Machinery in the Coal Mines

It is probable that a large percentage of Americans, if asked to give a reason for the extremely high pay of soft coal miners, would attribute it to union aggressiveness. Mr. Lewis and his United Mine Workers have been consistently in the headlines in late years, and seem never to run out of demands on the coal operators.

Even so, giving the union its proper due, it is obvious that there must have been other vitally important causes of record mine wages. One of the biggest of those eauses has been the fact that the operators, at tremendous cost, have been mechanizing mine operations for a long time. And the upshot of that is that the American miner gets out a great deal more coal each shift than his European or English counterpart. He doesn't do it because he works harder. He does it because machines have eliminated slow pick and shovels.

Now the operators are planning to carry mechanization further, and to add more machinery as rapidly as possible.

Competition with other fuels in intense, and it is felt that higher daily output per man is absolutely essential if the industry is to keep its markets—and to provide its highly paid jobs. In a typical soft coal mine today, payrolls amount to more than 60 per cent of operating eosts. That proportion must be reduced.

Complete mechanization won't come overnight. According to Business Week, it costs around $350,000 for the machinery used at the face alone of a 2,000 ton a day mine. But the industry is cut to insure its own survival, to protect the coal eonsumer, and to provide maximum employment.

Cattle:

Watch for Screw Worms. It was predicted in the spring that screw worms would be very late coming to Alabama this year because of the hard winter in Florida. If we are to have screw worms this year, they should arrive about this time. Watch all livestock every day for cuts and wounds and treat them with Smear No. 62.

Grazing

October is a good month to finish seeding Caley peas and Lappacea clover in the Black Belt.

Oil's Record

If anyone still doubts that the oil industry is an extremely competitive cnterprise, he should, as Al Smith used to say, look at the record.

Today more than 34,000 companies are engaged in the oil business throughout the country. Nearly 13,500 are .n the production end, 400 are refiners, 650 are engaged in transporting oil and oil products, and 20,000 are concerned with wholesale marketing and distribution. In addition, there are nearly 250,000 service stations, all of which are competing for patronage.

The results of so competitive a situation have been far-reaching indeed. The various companies have tried to outdo each other in producing oil products—and some 5,400 have been developed. Producers have been aggressive in seeking new sources of oil—and today the country's proved reserves of crude oil and natural gas liquids are the highest in history. Finally, competition, combined with enormously improved producing and refining methods, has held down oil prices. As an example, the retail price of gasoline, exclusive of taxes, is now about half of what it was 25 years ago, and the quality is a great deal higher.

The oil industry works on the typically American principle that progress never stops—that a better product is always possible. To this end, it employs every resource of science, finance and inventiveness. The beneficiary is the entire country.

Home Improvement Drive Major Project of Clarke Homemakers

Home improvement is one the major projects among Clarks County, Ala., homemakers this year. In each community somc type of improvement is being made. Homes arc being made more attractive and convenient.

Mrs. Susie Rodgers of Zimco community started her home improvement by putting imitation brick siding on the house and by making new screen windows and doors. She also added concrete steps.

Further improvement was made by putting on a new aluminum roof. Mrs. Rodgers sold timber to get the money to take care of the expense of this improvement.

To improve her kitchen she bought a new stove, boilers, dish pans, and built wall cabinets to store her pots and pans. Recently, she put in a pantry store so that she could qualify as a pantry store demonstrator.

This family is now enjoying this comfortable home.

No Feed Bill Paid by Culls in Flock

Cull hens pay no feed bill, sa Alabama poultrymen are losing thousands of dollars each year by keeping them in laying flocks.

A hen will eat about nine pounds of feed a month, says API Extension Poultryman John Ivey. Figured at five cents a pound, this amounts to around 45 cents. With feed making up 60 per cent of produetion costs, poultrymen ean quickly figure how many eggs a hen must lay to pay her way.

Since some layers arc going out of production during this time of vear. poultrymen should cull their flocks now, Ivey stated.

Rare Grass Sprouts

San Francisco —(UP)— A new grass species has been found north of here on a pinpoint of land less than an acre square. California Academy of Science botanists say no other place in the world grows the species. It is ealled agrostis aristiglumis.

Alfalfa, properly seeded and managed, will produce more high-quality roughage than any other crop north of the fall line.

The Retailer's Story

Congressional hearing on the subject of commodity prices have now been held in a number of key cities throughout the country. A great volume of testimony has been heard, from manufacturers, retailers, labor organizations, consumer groups, etc. Much of the testimony, naturally, has been sharply opposed. But on one point near unanimity has been achieved—retail business has not been responsible for price inflation but, to the contrary, has fought it in every possible way.

A number of representative retailers have testified that there mark-ups are lower than ever. The profits made, after expenses, on each dolar of sales, are figured in pennies. This is true of the big chain systems, of independents, of department stores, and of all other elements in the retail system.

The operator of a clothing store said that if his prices were reduced only 5 per cent, he would sustain a substantial loss for the year. That is indicative of the position of retailing in general.

The contribution of retailing to holding price increases to the minimun has been positive. Operating costs have been pared when possible. Stores have refused to stock items which their buyers considered overpriced. Retailers have worked with manufacturers to produce better quality goods. And many stores have shown evidence that their gross profit is lower than under OPA.

Prices, in short, are beyond the control of the retailer. He is performing an exceptional job under the most difficult conditions. That job should be given the public reeognition it has so throughly earned.

Extension Agent Gets High Post in Foreign Mission Field

Thomas A. Harris, colored agent in Jackson County, Florida, has accepted a post with the Methodist Church Board of Missions. reports T. M. Campbell, Extension Service field agent of the U. S. Department of Agriculture.

Harris, who has been in Extension work since 1941, expects to be placed at Nanping, China, where he will assist in the development of agricultural and related programs.

Autauga Farmer Develops Better Cropping System

Five years ago Henry Rawlinson was owner of a poor 120-acre farm in Locust Bluff Community, Autauga County, Ala. He grew cotton year in and year out with yields going lower each year.

That was before his county agent. Worthy Hughes. came along and helped him work out a cropping system and terrace his farm.

Then Rawlinson fertilized and sceded eight acres of moist bottom pasture land to white Dutch clover and Dallas grass th efirst year.

Three acres of kudzu also were set out on the steep slopes to prevent further damage to the land and to provide temporary grazing and hay. A rotation of cotton and corn followed by winter legumes has increased his yields.

To make full use of his pasture, hay, and other home grown feeds, he has two milk cows and seven feeder steers. A flock of 25 hens. three brood sows and a year-round garden supply most of his home needs. The sale of hogs adds to his cash income.

Rawlinson fenced his farm and is able to control the damage done by livestock.

County Agent Hughes points to Rawlinson's farm as an example of what any farmer can do if he follows a system of farming that gives income from more than one enterprise.

Asked why he wanted to remain in jail after he had completed his sentence, a Maine man answered succinctly, "I've been reading the papers."

State's Leading Negro Farmer Is Selected

Lee Lesley of Rutherford County has been named the leading Negro farmer in Tennessee for 1947 because of his soil conservation practices, officials of the SCS, who selected him, announced this week.

Lesley owns a 33-acre farm on the Nashville highway near Murfreesboro and was formerly a farmer in Alabama. He moved to Tennessee about seven years ago to the small farm which he described as being covered with weeds, with traces of cotton and cornstalks in the fields which had been abandoned by the former owner. Among the many soil conservation practices Lesley is conducting on his farm, which includes alfalfa production, contour planting, Bermuda grass sodding, pasture clipping, he constructed a rock wall soid retainer between his and the adjoining farm.

The young apple tree from which he is picking fruit is one of approximately 20 trees of different kinds of fruit he has set since moving to Rutherford County. He is milking six cows, and, according to his own statement, he is making the easiest living ever.

State Farm Products Bring Higher Prices

Farm product prices advanced sharply in Tennessee during last month, a federal-state department of agriculture report showed yesterday.

The report showed that the price index stood at 275 on Set. 15, or only one point below the year's high of 276 reached July 15. The present index figures are compared with the 1909-14 average of 100.

Many Items Increase

Sharp increases in prices were registered for a large number of items. between Aug. 15 and Sept. 15. The report, recorded substantial increases for grains, hay, cottonseed, hogs, and milk cows. Seasional advances were made by dairy products, chickens, eggs, and turkeys.

Prices of most Tennessee farm products were shown to be higher in September of this year than a year ago. Among the important exceptions, selling at lower prices, were cotton lint, apples, wholesale milk, horses, and mules.

Price increases for the period included hogs advancing in price from $25.40 a hundred' weight in August to $26.80 in September; veal calves, from $21 a hundred weight to $22.50; sheep from $7.20 to $7.40.

Whcat jumped from $2.26 a bushel to $2.49; rye from $2.24 to $2.39; corn from $2.27 to $2.37; oats from $1.03 to $1.22; barley from $1.51 to $1.70 and hay from $21.70 to $22.40.

Butter on Increase

Butter advanced from 50 Cents a pound to 57 Cents and butter fat from 66 Cents a pound to 72 Cents. Milk, wholesale, advanced from $4.50 to $4.75 a hundred pounds. Chickens advaneed from 26.2 Cents a pound, live to 26.4 Cents.

Prices received by Tennessee farmers for many products were considerably higher in September than prices for the United States listed in the report.

For example wheat was bringing $2.49 Cents a bushel in Tennessee and the price for the United States was quoted at $2.43; oats were quoted at $1.22 a bushel in Tennessee and $1.08 in the United States.

Other products priees were shown to be lower in Tennessee than those quoted for the United States average. Hogs, as an example, were averaging $26.80 a hundredweight in Tennessee and $27.20 in other parts of the United States. Similarly beef cattle brought an average of $16 a hundredweight in Tennessee and $20.20 in the United States index.

1,500,000 Farms in South Still Lack Electricity

About 1,500,000, or hait the farms in the South still arc without electric service, according to the annual Rural Electrification estimates which were announced last Thursday.

For the country as a whole, 39 percent of the farms were without electric service as of June 30 of this year. However, 400,000 farms were electrified during the past fiscal year. This is the largest number of farms on record to be electrified in a single year. The total number of farms that now have electric service stands at 3,574,641 or 61 percent of all farms in the United States.

Nevertheless, approximately 2,285-000 farms remain unelectrified. Of this number, 1,477,000, or 65 per cent, are in the South. Mississippi and Texas have the largest number of farms without electric service. In the former, 177,000 farms lack electricity, and in the latter, 170,000. However, on a percentage of basis of farms lacking electrie service, North and South Dakota stand in greatest need of any of the States. Over 80 percent of their farms are unelectrified.

Commenting on the situation which the 1947 estimates reveal, Rural Electrification Administrator Claude R. Wickard said.

"In spite of the great progress in rural electrification since 1935 when only 10.9 percent of our farms had service, the task remaining for the future is more diffieult than what has been so far accomplished. The areas easy to electrify have been electrified for the most part. Only a policy of full area coverage, such as has been adopted by more than 1,000 REA-financed cooperatives and power districts, gives assurance that the 2 1-4 million unserved farms will ultimately get service."

Big Job

The Texas City disaster of last April illustrated the fact that every home owner should have his fire insurance checked by an expert to make certain that it adequately covers possible contingencies.

In Texas City, most of the damage was the result of concussion—and concussion damage is not payable under an ordinary fire policy. However, Texas City was in a known hurricane area and so luekily, the great majority of the policyholders had taken out what is known as extended coverage—an endorsement to a fire policy which, for a small sum, provides coverage for a wide variety of special hazards, including windstorm, smoke, riot, off-the-premises explosion, etc. Had they not had the endorsement, recovery would not have been possible.

Texas City also demonstrated the splendid service provided by fire insurance companies in a time of emergency. A representative of the National Board of Fire Underwriters went to the scene immediately. A Catastrophe Plan was put into effect, under which experieneed adjusters dispensed with many formalities and made payments on policies in an extraordinarily short period of time. This voluntary "super-service" presented great economic hardship for a legion of families.

Fire insurance is one of those institutions we just take for grantcd. Yet when disaster strikes its value is beyond measurement.

Warm Weather Causes Peach Tree to Bloom

The continued warm weather of the past few weeks has caused a peach treee to bloom on the farm of Mr. and Mrs. Paul Thornton of Bakerville.

This is the first report of a peach tree blossoming this season.

Cutting string beans with scissors save time and thumbs.

THE FORUM

The Modern Farmer

Published monthly by the Modern Farmer at Nashville 3, Tennessee.

Farm Talk With Farm Folk

By Jesse Safley

Soil eonservation and restoration is an art whieh is aequired over a period of years and to a great extent through the trial and error method. It might well be compared to school because those who practice conservation and rebuilding must first learn the A, B, C's of their problems just like the beginner does in the school room. Students must learn to trust the adviee offered them by technically trained conservationists just as the small ehild learns to trust the adviee of his teacher. All this requires time.

For those reasons. we— like many others—question stories we often hear these days about a man or maybe a whole eommunity whieh in a short period of one year converted farm land from gullies to fertile, productive land through soil conservation methods. We read or listen to those stories and then wonder. How is it that a man in the eourse of one growing season ean do so many things on his farm . . . as change from grade livestock to pure breds, terraee all his fields that have been washing for so many years, remodel his home and wind up with several hundred dollars more in the bank than he had to start with. Usually progress stories of this type cover a period of two or three years, but recently we have heard of all these things being accomplished in one year by entire communities as well as individuals.

We know of farmers, who have been applying eonservation praetices to their farming programs for a anumber of years, yet they tell us they have much to do yet and are forced to do many of those things as they earn money to put back into their farm.

To many who are trying earnestly to earry out those practiees which are recommended to rebuild land, progress stories like those mentioned above will have a tendency to discourage farmers. It is hard for a person to understand how others can make so much progress so quickly while his progress is so slow. To that fellow we say: "Keep doing what you started because time alone will determine whether things are as they seem."

We do not doubt that a farmer might in one year's time terrace all his rolling land, plant with the contour, purchase new farm equipment and livestock, improve the surroundings about his home, construct stock water ponds and even purchase a new automobile, but when we're told he did all this from nothing and had cash left in the bank, we believe someone is dealing recklessly with faets.

It is a known fact that nature requires several hundred years to add an ineh of soil to the earth's surfaee that portion of the land which provides our wealth, therefore it is doubtful if man can improve on nature so many fold.

We are not, in any sense of the word, saying that those individuals have not made great progress in a program that has been sadly neglected for years, because we know that they have— and it is not the fault of these farmers that the stories are misleading. The main source of so many stories of this type is through enthusiast agricultural workers who impart information to people who have very little conception of what is involved in a farming program.

There would be no point in our mentioning such ineidents if it were not for the fact they are in a sense detrimental to our agricultural program. That is true for two reasons. One we have mentioned before—that is diseouraging those who are exerting every effort possible and yet their progress is slow, and the other—it leads those who don't know the whole story of farming to think the farmers may get rich simply by making a few ehanges in their present system of farming.

Our answer to those two points is this—farmers who are not making the progress they hear others are should eheck with those fellows and see where they might make some changes; but by all means don't become discouraged over things you hear. If your community is eonducting an improvement program the best you know how, continue to do so regardless of what others may have aecomplished. To those who know little about farming and feel that farmers are getting rich and living a life of luxury, all we have to say is—try it! We will wager that 95 per eent of those who gripe about the prices they pay for food would not exert the effort required to produce it if they were brought to task.

Farming in Kansas Much as in Tennessee

By Jesse Safley

Farming in Kansas is not so different from farming in Tennessee. That is the impression we got last week after visiting a number of farms some 50 to 100 miles from Kansas City. We were in that section of the eountry to attend the National FFA Convention and the American Royal Livestock Show, so we took advantage of the opportunity to see some actual farming in the Mid-West.

On the farms we visited, they grow alfalfa, corn, small grain and various types of livestock and earry on some dairying. The farms on the average are no larger than those in Tennessee, but the percentage of crop land is higher. Of eourse farms are larger as you go west and are devoted more to small grain production.

Farmers up there have definitely suffered from the lack of rain this year. As shown y the corn erop, which had not been gathered. Under normal conditions eorn yields average 60 to 70 bushels per acre. Now they are lucky to get 25 to 35 bushels an acre. While alfalfa hay production has been cut, the average yield is more normal than other crops. They are now harvesting their fourth crop. Aside from being short, it is otherwise a good crop.

Although the weather for curing hay has been ideal in that section for sometime a number of the farmers told us they were not going to take a chance by allowing their crop to remain on the ground until it was completely cured. The hay wil be placed in the barn with a fairly high moisture content and common salt will be sprinkled over it. That not only helps to finish cure the crop, but makes it more palatable, especially if the hay is kept over into the second year as Kansas farmers often do. They see no reason for selling hay this ycar and buying next. The practice of salting the hay, both in the barn and field, seems to be general. While it will have a tendency to discolor the leaves that come in direct contact with the salt, the injury is usually small and the remainder cures as much brighter color than that left in the field to sun eure.

Most of the fall seeding of small grain has been completed up there. The moisture content of the soil is sufficient for germination. However, it was understood that further West prospects for a grain crop, equal to normal production, were slim due to drought.

The problems of the farmers there are about the same as here also. They are faced with erosion, although the soil is not as rolling as ours. They are unable to get the neeessary maehinery and other essentials, fertilizer and the like. They are having to pay high for farm labor and they are not sure about the grain market.

We talked with a group of farm-laborers who were filling a silo. These boys ranging in age from 16 to 20 were receiving $1 per hour. However, the eustomary wage for average farm labor is 75 cents per hour. Unlike Tennessee, where the laborers are given their lunch on the farm, they are taken to eafes in nearby towns.

We visited one grain elevator where the new crop of eorn was being purehased. Wagons, trucks and tractor drawn trailers were lined up waiting their turn on the scales. We asked the farmers as we walked down the line what they were to get for their grain and without exception, they said, "I don't know what they are paying today." It wasn't the first time we had heard farmers make sueh a statement about the product they had to sell after much exense and labor in production. but it did reflect how unstable the farmer's ineome might be and the difficulty he experienees in formulating a long ranged farm program. Incidentally, the priee for corn that day was $2.20 per bushel.

Although gulley erosion is evident on most all sloping land, very little if any attempt is being made to prevent it through terraees. We did not see a single terraee on the 100-mile trip. While the crops are not planted up and down the hill, there was a very small amount of contour planting.

Volunteer meat rationing is not being praeticed by the cafes and restaurants in that area of the eountry. That is true in large cities as well as the small towns. The reason given was "after finding no other eating plaees cooperating, we quit."

We heard Seeretary of Agriculture Clinton P. Anderson say in his address to the FFA Convention that the world is depending on agriculture for eeonomic reeovery and political stability. That is similar to the cries made by the government during the war. Who was among the first to suffer losses following the end of the war. Now, it has to be done all over again and chances are in the end the federal government's attitude about aid to farmers will be the same.

We asked Lord Inverchapel, ambassador from Great Britain who also addressed the Future Farmers if it was true that his country's population of livestock was back to the pre-war level. He said it was true in beef and dairy animals, but the produetion from those animals was reduced because grain normally used for feed had been diverted for human consumption.

That's what will happen in our country if we reduce feed to livestock as the government has asked. However, we do have more opportunity to provide nutritious pastures than the English.

Many Soils Need Phosphate Potash

Tests of samples of soils, made at the Agricultural Experiment Station at Lexington, showed that much land in Kentucky needs applications of phosphate and potash to grow good crops.

More than half of 686 soil samples taken from farms over the state showed too little prohphate to produee good tobacco, and a third of them laeked enough phosphate to produce, good grain crops or grass and hay.

Potash also was found too low in over half of the soils to produee good tobaceo or alfalfa, and 39 per cent of them eontained too little potash for producing good pastures or corn.

Twenty Million

(Continued from page 1)

community gardens in growing vegetables suited to fall, winter and early spring produetion. The department of Agriculture and Cooperative State Extension Servies will, as in years past, stress home gardening and food preservation, and they will assist in providing gardeners with practical how-to-do-it information.

"Twenty Million Gardens are recommended as the minimum goal for 1948. The produce from these gardens ean take the place of many foods vitally needed for export. And by helping himself to meet increasing living costs, the home gardener will be helping his own eommunity to make a precious eontribution to a hungry world."

Liberty County

(Continued From Page 1)

Through Farm and Home Production and Conservation." Mr E. B. Cooper, Farm Agent, stressed the importanee of the various booths being classified as Community Booths instead of Home Demonstration Club Booths as in the past years. Worthwhile prizes will be given to the community exhibiting the first second and third best booths, other communities will be given a eomplimentary prize additional individual prizes will be awarded for the following—The best quilt, sack material article, embroidered piece, eroeheted piece, pine needle work, yeast orcad, plain cake, can of fruit, ean of vegetables, garden product, chenille or candlewick work, pot flowers, dozen of eggs, ears of corn and the best pig under 12 months of age.

Miss Mattie Mathis, home agent, gave a very interesting demonstration on "Time Savers for the Kitchen."

Miss M. A. Turner, Jeanes Teaeher, made special emphasis on the importance of parents cooperating with the teaehers in keeping their ehildren in school during rainy weather by supplying their children with overshoes, rain coats, and other neeessary garments. She also emphasized the necessity of providing wholesome recreation for our children to keep them out of the streets.

Each club present made a very good report of the achievements in its community for the past three months. After the meeting adjourned the council was served a very delectable repast by the Freedman Grove H. D. Club of which Mrs. Cornelia Mullice is president.

Wilson County

(Continued from page 1)

some," said Mr. Ruffin, "we plan to buy. Just got to have a farm for our son who is now studying agriculture at college. He spent three years in Serviee. We'd like to buy in our community where all our friends are."

County Agent Foster says that the Ruffins are among the most energetic and enterprising farmers who sell at the market. "Although they live 16 miles from Wilson, farther than most of the sellers, they are usually first to arrive every market day—Wednesday and Saturday," says Mr. Foster.

And Miss Helen T. Wade, county home demonstration agent, points out that the Ruffins' products are always of high quality and are usually attractively arranged on the curb market stands. "Grading and preparing farm products for market are two important lessons that we are trying to put over," states Miss Wade.

Other important lessons which the curb market sellers are learning are: the monetary value of vegetables, fruits, poultry, and poultry produets; business arithmetic; and the need for inereased production of sideline erops for market.

Mr. Ruffin, who is shareeropping 40 acres, is now devoting three and a half aeres to vegetables. The rest is in cotton, corn, tobaeco, peanuts, and a small pasture for his two cows and 14 hogs. A third of the receipts from his cotton, corn, tobacco, and peanuts go to the landowner with whom the Ruffins sharecrop, but the income from his curb market sales is all his.

So proficient as a curb market seller has Mr. Ruffin become that he is now treasurer of the association and a member of the advisory board. State Agent R. E. Jones says that the operation of this curb market simply demonstrates what a little guidance can mean in helping farmers to lift themselves toward better living and a secure place on the land.

27,000 White and

(Continued from page 1)

297 adjustment loans went to new borrowers, ineluding the 23,654 veterans, 70,940 went to farmers who were already on the program, and one-year loans went to 76,776 farmers.

Ownership loans went to 5,807 farmers, ineluding 3,200 farmer servieemen, and water facilities loans went to 1,064 farm families in Western States. Of these loans, 153 went to veterans. Ownership loans to veterans amounted to $24,819,296, or over half the total funds loaned for this purpose.

The summary also shows that collections for the year totaled $172 million leaving a remaining outstanding indebtedness of $606,378,612.

Plow Corn Shallow and Lay-by Early

More corn will be made in Alabama this year by farmers who cultivate shallow and just often enough to kill weeds and grass, and lay-by early. J. C. Lowery, API extension, agronomist, has observed that in some cases, corn yields have been cut in half by deep and late plowings.

Passing the Buck Again

The latest wave of price rises has had the usual results. Everybody is looking for a scapegoate. Business, labor, government and agriculture have all passed the buck back and forth among themselves. No group admits that it is in any way responsible for inflation—the fault always is laid at the door of the other fellow.

This has produced a great deal of confusion among the consumers, who are eagerly searching for the villian responsible for higher prices. Worst of all, it has tended to cloud the fact that present prices are an inevitable result of the economic pressures of the time. The nation is in an industrial boom. Wages and all other costs, including taxes, are at an all-time high. We are shipping enormous quantities of goods abroad, which tends to create scarcities and consequently higher prices in the American market. Our $260.000.000,000 public debt is a powerful inflationary factor. And, finally, the American people want more and better goods of all kinds.

It will be particularly unjust if consumer resentment is largely directed at the retailer simply because he is on the firing line and provides a handy target.. Retailing is not responsible for high prices, and has taken positive action to prevent prices from going even higher than they are. According to an authoritative report, net profits, after taxes, of department stores were but 3.1 per cent of sales in the six months ending July 31—less than half of the level attained in the same period last year. Food chains have issued summaries showing that their profits are even less. Retailing is fighting inflation with every weapon available—but it can't achieve the impossible. Price tags, in the vast majority of instances, are simply true reflections of 1947 economic conditions, and until those conditions change, cost of production and prices will remain hig h.

Farmers Get Fields Ready for Alfalfa

Work has begun on thousands of Alabama acres to get land ready for alfalfa this fall.

Most farmers are planning to seed alfalfa on fields where vetch has been turned under. These areas are being disked and harrowed often' enough to kill weeds. says API extension agronomist, J. C. Lowery. By alfalfa planting time, farmers will have firm seedbeds free of weeds to help insure good stands.

Lowery cautions farmers to make arrangements now for fertilizers and seed needed for the crop. If lime has not been applied, lime tests should be made and the material disked in now.

Good Chicks Pay Conecuh Family

Mrs. Francis Welch, of Herbert Community, Conecuh County, says that good chickens are profitable, and she has figures to back up her statement.

She bought 950 white Leghorn and Rhode Island red chicks during the period from February 1, 1946 to April 30 this year. The chicks cost her $93. Only nine of them died, and the company from which she bought them gave her . 100 more as a reward for her success.

Commercial feed for the chickens cost $211. Other expenses amounted to $71, making a total of 284. She kept 39 white Leghorn pullets for egg production. The family ate 102 fryers and she sold 800 2½-pound fryers for $1 each.

From her sales Mrs. Welch used $250 to buy a five cubic foot freezer unit. She used $35 to buy an electric heater and is saving $140 to be used later in remodeling and painting her kitchen.

Mrs. Welch says that even though the risk is greater, it takes about the same time to care for 400 chicks as for 100, and she gets four times the returns for her labor.

Productive Agriculture

One reason for the economic strength of the United States is the efficiency of the American farmer. The high production of American agriculture means that a steadily increasing proportion of the population has been able to devote its thought and energies to other pursuits.

Scientific, mechanized farming has made far greater strides here than in any other major country. American farmers represent only 2 1-2 per cent of all the farmers of the world—yet they produce about 20 per cent of the world's food supply. There are various reasons for that achievement, and agricultural machinery is one of the most important. Tasks that, abroad, are slowly and laboriously done by hand are swiftly and economically accomplished by machinery here.

This illustrates, in turn, the close relationship between agriculture and industry. America produces 50 per cent of the world's steel—and it is steel which has made possible the mechanization of agriculture. The first steel plow was produced 110 years ago, and ever since progress in steel and in farm production have gone hand in hand.

The end result is a higher standard of living for all Americans—a more prosperous agriculture—an industrial wage scale unequaled anywhere else—a stronger, richer nation.

Fire in the Factory

Last year, this country suffered 800.000 destructive fires. The toll in property was more than $500,-000,000. Over 10.000 lives were lost.

Half of this waste was in business and industrial establishments—the places where people work and produce. And the dallar loss, as W. E. Mallalieu of the National Board of Fire Underwriters has said, "was only a fraction of the total destruction caused by fire. The indirect losses in medical costs, in jobs, wages and production lost, savings reduced and business failures, were probably two or three times greater."

The factory owner and the factory worker have an identical interest in fire prevention. If the plant burns, both will suffer, and so will the community which it serves and where it pays taxes and meets payrolls. A gutted plant is a dead loss to the American production machine. And losses of this nature are often especially serious in the smaller communities, which depend on one or two establishments for their economic life.

It is the duty of management to make factories, stores and all other places of business as safe from fire as human knowledge will permit. It is the duty of workers to cooperate in observing the rules which will prevent most fires. It is the duty of all to know what to do if fire does strike.

The National Board has issued a booklet, "Stop Fires—Save Jobs," which goes thoroughly into industrial fire prevention and protection. It will be sent free on application to the Board at 85 John St., New York City 7. If the basic principles it describes are observed, loss of property and life from fire will drop sharply.

Portraits

FRIENDLY SMILE

Of all the old and new delights
That make this life worth while
I think that none gives greater joy
Than just a friendly smile
A smile that seems to say hello
And how are you today
And sort of picks your troubles up
And pushes them away
It is a greeting fit for kings
Yes always it is free
And it belongs to every class
Of social company
A friendly smile relieves the strain
wherever strangers meet
And as it praises victory
It comforts in defeat
It is the kind of handshake that
Will penetrate a glove
And now and then it lights the flame
That kindles love.

Facts About Prices

Consumer protests against the high cost of food continue. Understandable as this is, it seems certain that the public at large is unaware of certain basic economic facts.

According to one authority, food bills are no greater today in proportion to gross per capita income than they were in the 1935-39 period. They have, in other words, simply followed the general trend.

Again, farm authorities have presented some very compelling evidence to the effect that allegedly swollen agricultural profits are largely non-existent. The enormous increases in farm operating costs—labor, materials, feed, taxes and everything else—have eaten up the increase in the farmer's gross income.

To blame packers and retailers for high prices is a common practice. It is also an utter fallacy. The meat packing industry, for instance, states that it earns less than one cent a day, after expenses, for providing meat for an average American family of four.

The retailer is in precisely the same position. The large food chain systems earn, as net profit, only a cent or two on each dollar of sales. The independent merchants, who must meet the competition, work on similar margins. Many stores have voluntarily sliced their already narrow profits in order to hold price increases to the minimum. But they can't operate at a loss.

High prices are an ceconomic consequence of the times. Neither producers, distributors, processors, or retailers are responsible for them.

$5,000,000,000 for Electrical Development

Those who believe that the future of electric power development in this country depends upon the government socialized systems should carefully read a news release recently issued by the Edison Electric Institute.

During the next five years, the release states, $5.000.000.000 will be spent by electric light and power companies in the United States on construction. That sum is more than one-third of the present entire capitalization of the 65-year old business-managed electric industry. And, of great, significance, it will add more new generating capacity to local electric plants than is presently installed in all of the governmental projects combined, including TVA, Boulder Dam, and Bonneville.

The release casts further light on the relative importance of hyiroeelectric installations as opposed to fuel-fired plants. The hydro systems have made most of the head lines in recent years but, in spite of that, the fuel plants do the bigger job by far. About 95 per cent of the $5,000,000,000 worth of new generating facilities will consist of steam turbines using coal, oil, or gas. The installed capacity of all water power plants still comprises less than 30 per cent of the total generating capacity of the country, and is expected to drop to 27 per cent or less in the next three or four years. The reason for that is plain—the great industrial centers of America are largely in regions where water resources are insufficient to produce the needed power. The fuel plant is king.

The $5,000,000,000 which will be spent in the next five years—like all the other billions the industry has spent in the past—will be a testimonial to the vigor of free enterprise. It will be private money—not tax money. It will create great new taxable assets—instead of destroying taxable assets as do the tax-exempt government systems. It is still more proof of the fact that we don't need socialism in this country—nor do we need a supergovernment, staffed with millions of hungry bureaucrats, to manage our affairs.

ADDED FLAVOR

Try putting a quarter teaspoon of poultry seasoning in your meat loaf for added flavor.

Stretching the Dollar

The trend in retailing has been toward lower distribution costs and smaller margins of profit. As an example, it was recently reported that overall mark-up in one city for grocery, meat and produce dealers was as low as 10 1-2 per cent, while operating costs consumed 8 per cent.

All kinds of retailers have been studying ways and means of cutting expenses and putting economics into effect. The chains have been leaders in the undertaking, and the independents have followed the trend. This is retailing's way of meeting the tough cost-of-living problem. It has no control over wholesale prices. What it can and is doing is to reduce the spread between the price paid the manufacturer and the price charged the consumer.

As a result, price increases have been less than would otherwise have been the case. That may not seem much of a service to consumers who have been struggling to make shrinking dollars buy more. But it has undoubtedly resulted in saving a great many billions of dollars for the American people. Retailing alone can't stop inflation—but it does help restrain it.

It is any man's guess when—and if—prices will come down. Recent developments indicate that there is little immediate hope for reversing the wage—price spiral. But, regardless of what may happen, retailing will give the consumer the best possible return for his money.

Farm Woman

By Lera Knox

Comes now grape-time of the summer. There is something about grape-time that always makes me supremely sad. I don't know how to explain it except to say that it must be the way the poor, tired-looking, forlorn mother vine seems after her bunches are gone. The mother grapevine seems more pitiable than a mother hen who has weaned her chicks, or even a cow whose vealer has gone to the stockyards. To me the grapevine that has "weaned" her grapes looks more like a human mother's heart feels after her last child has gone to college or been married or gone to the army or obtained a job in "Dee-troit."

But enough of that sentimental sort of stuff Let's get down to the practical side and use those grapes while we have them.

As in canning peaches, apples, or anything else. I like to reduce grape canning to its simplest method. And that is perhaps the old and often tried method of hot water and little or no cooking.

Sterilize the jars. That's first and most important step in any canning. Now fill jars, or half fill them, with clean fresh grapes. Add half a cup of sugar, fill the jars with fresh boiling water, seal and store.

That's the usual method, but I always go a step further and simmer the jars in hot water bath about 15 or 20 minutes to make their sterilization sure. In winter you'll have delicious grapejuice from the water you have added, nd fresh tasting grapes for pies. They're good.

And now that sugar is available again. I'll dare to give you my favorite recipe for uncooked grape jelly.

Remove grapes from stems, wash, put on the stove in a vessel without water. Crush and heat slowly, just enough to draw out the juice.

Strain the crushed-out juice and measure. While still warm or almost hot, add 3 cups of sugar to every 2 cups of juice (this proportion is important.) Stir until sugar is thoroughly dissolved, pour into sterilized glasses, and the mixture should jell by the time it is really cold; say in about 10 minutes.

The only way this jelly will keep is under lock and key. It is that delicious.

In case the grapes may be a little too ripe or a little too green, and the congealing process isn't complete, you can still add two more cups of juice to the 2-cups-juice and 3-cups-sugar mixture, cook a few minutes, or until two drops hang from the spoon, then pour into glasses. But if the pectin and acid content of the grapes is just right, your jelly will be the best ever. Remember, no water!

If you don't put water into your jelly, you won't have to boil it out.

Efficiency Offsets High Farming Costs

Better use of time and labor offers the best means for Alabama farmers to meet the era of falling agricultural prices.

John Liles, Jr., API extension economist, says that farm wage rates are three times pre-war levels, and to reduce costs, production per worker must be stepped up greatly. This can be done by more careful planning of work and by giving farm labor better farm tools and machinery.

Full use of equipment is also important in reducing production costs. Liles figures that the average tractor in the state is used only three-fourths of the time it could be. He added, "Getting this extra 25 per cent of tractor use may mean the difference between profit and loss."

National 4-H Achievement Week

National 4-H Achievement Week was observed November 1-9, Extension Service of the U. S. Department of Agriculture has announced. Approximately 300,000 colored farm boys and girls are 4-H members.

Cotton Forecast Up

The Crop Reporting Board of the U. S. Department of Agriculture estimates cotton production this year in the United States at 11.844,-000 bales.

Wings Over Jordan Choir Activities

New York, Nov. 14—Sponsors of the Wings Over Jordan Choir have been given unexpected promotion assistance through a unique plan arranged by Rev. Glynn T. Settle. Promotion and publicity experts, hired by Wings Over Jordan, visit key cities in which the choir is scheduled to appear to give the local sponsor the benefit of their experience and training.

The "Audience Builders' plan has been supplied without additional cost to sponsors. It naturally results in capacity audiences. Rev. Settle arranged this service, probably the only one of its kind, to further the work of Wings Over Jordan in raising funds for worthy organizations. His theory is that, regardless of the great popularity and appeal of any attraction, proper promotion is essential for financial success.

At present, the plan has been in successful operation for nine months. Since the service cannot yet be given to all sponsors, it is primarily arranged for church and charitable organization sponsorship Particular emphasis has been given to Ministerial Alliances which have been sponsoring a great number of the choirs recent engagements.

Mr. Benjamin F. Adams of Birmingham, Ala., is now carrying out this important assignment and is training additional personnel so that the service may be expanded to include all sponsors. Mr. Adams has an excellent promotion and publicity background and, in the past, has very successfully sponsored appearances of Wing Over Jordan and other outstanding attractions.

Although many of the concerts are played under white sponsorship, Mr. Adams has found no racial problem in fulfiling his assignment. It has been proven time and time again that racial considerations do not enter into the successful promotion of the Wings Over Jordan Choir.

State Livestock Import, Export Remains Stable

By Robert Battle

The Tennessee Department of Agriculture today reported that import and export trade of livestock has remained about the same as far as number of head is concerned this year as compared with previous years.

This past season some 3,420 horses and 20,850 mules were exported to other areas, while the preceding year 3,158 horses and 18,692 mules made their way to new owners in other sections of the nation and world, it is reported.

Imports of horses and mules for the past year show 4,005 and 11,545, respectively, as compared with 4,038 horses and 8,351 mules the year before.

Tennessee — one of the South's leading dairy states— exported 5,741 dairy cattle last year, and 5,882 head the preceding year. The year before last imports of dairy animals into the state totaled 731, the Department of Agriculture revealed today in a report compiled for the commissioner of agriculture. The following year showed a total of 2,686 head of dairy animals imported.

In both years the imports of beef cattle greatly exceeded the exports.

ON THE AGRICULTURAL FRONT

URGE TRAINING PROGRAM FOR WORKERS DISPLACED BY COTTON MECHANIZATION

Washington, D. C.—Need for a training program for white and colored farm workers who may be displaced by cotton mechanization and for those who may remain to operate and maintain the machines was emphasized by E. D. White, Assistant to the Secretary of Agriculture, in an address last Tuesday before the cotton mechanization conference at Stoneville, Miss.

However, White was not alarmed over the prospects of any great displacement of farm workers in the immediate future. Pointing to the slow speed with which the reaper, the combine, and other revolutionary farm machinery have come into general use, he asserted that although the present level of engineering research may enable cotton mechanization to proceed at a faster rate than earlier machines, there is little cause for panic.

"In fact," said White, "I feel that we need a word of caution for those people who picture the cotton picker sweeping over the South driving before it hordes of displaced workers. I wish the picker, mechanical chopper, and other improved machines could come even faster than we have good reason to expect. Certainly, the speed with which they promise to come will not cause any great displacement in the immediate future----

"And as long as the labor displacement problem does not take on serious dimensions, and it has not done so thus far, we have the facilities of the U. S. Employment Service which should be of some help to farm workers in locating more satisfactory employment."

Continuing, the Assistant to the Secretary said "The Department of Agriculture recognizes that increasing industralization in the South would greatly decrease the possibility of a substantial social problem arising from complete cotton mechanization.---- -- However, if a social problem does arise, its solution will lie in means other than the slowing down of mechanization.

"More attention needs to be given to **retaining and relocating unskilled displaced field laborers.** At the same time **training is needed for those workers who remain on the farm to prepare them for the opeerati°n and maintenance of machinery.** The question of adequate training is a large problem in itself and deserves serious study by educational authorities.

In discussing the designs and production pattern of farm machinery, White stressed the need for machines to fit the family-sized farm. "No doubt," he said, "adequate credit to buy farm machinery will be a problem for many of the smaller farmers. Farmers on smaller-than-family-sized units may need credit to consolidate their production. To handle this problem we have the credit facilities and background experience of the Farmers Home Administration and the Farm Credit Administration as well as the commercial lending agencies ----"

Concluding, White said, "To summarize the thinking of those of us in the Department of Agriculture who work with cotton, I would say that we want to push mechanization all we can and as fast as it is economically feasible. We would like to see it suited for use on most farms and we want to do all we can to help people who may be disadvantaged by mechanization."

USDA Makes 8 Recommendations for Improving Rural Living

Eight recommendations for raising the level of living in rural areas were made last week by Assistant Secretary of Agriculture Charles F. Brannan before the House Committee on Agriculture and Subcommittee of the Senate Committee on Agriculture and Forestry which is studying long-range farm policy.

Speaking for the U. S. Department of Agriculture Committee on Rural Facilities, Services and Industries, Assistant Secretary Brannan based his testimony before the House and Senate group on two premises: (1) That our most valuable agricultural resource is People and we should be concerned. he said, about conservation of humans because, like the land, they can also detoriate, erode and be depleted. And (2) that farm people need parity of opportunity for self-development.

As solutions to these problems, the Assistant Secretary offered eight recommendations. (1) Widen the opportunity for making a living in rural areas by assisting farmers in acquiring land, livestock, and equipment, and by providing job opportunities for displaced farm people through the stimulation of industries in undeveloped areas.

(2) Provide greater stability on the land and wider opportunities for tenants, sharecroppers, and laborers to move up the ladder toward ownership of family farms. These could be accomplished, Brannan said, through improved leasing arrangements, adequate credit at low interest rates, and though assurance of better housing and sanitary conditions for farm laborers and their families. Migratory farm workers, he said, are probably the most helpless, downtrodden economic group in our entire country.

In discusing tenancy, the Assistant Secretary said: "The extent to which the typical tenant is at the mercy of the landlord is perhaps best indicated by a few startling facts: Only one tenant out of five has a written lease and practically all the leases run for only one year. Moreover in the three months before the census of 1940., one-sixth of all farm tenants moved, compared with only about one farm owner out of 40."

Other recommendations were: (3) Establish adequate health, sanitation, and safety measures for rural people through the development of public health units in all counties or groups of counties now lacking health service, and through the establishment of cooperative group health associations and a national system of health insurance.

(4) Provide an adequate educational program for rural people through the training of teachers and the upping of salaries, also thru broadening the scope of the Extention program.

(5) Assist farm people in obtaining better housing. The Assistant Secretary pointed out that two-thirds of all farm families are ill housed.

(6) Extend social security to farm people. Brannon said that farm families face all the hazards that other families face—old age with earning power reduced or gone, accidents, disabilities and sickness that cut income and bring high medical and other expenses, and early death to the main earner.

(7) Continue to extend electrification and telephone services improve roads and recreational facilities.

And (8) assist farmers in the extension of cooperatives and in the development of programs in cooperation with rural churches. Brannan said that it has long been public policy in this country to encourage farmers to help themselves through cooperatives, thus solving complex economic problems on a group basis.

"By lowering production costs, increasing marketing efficiencies, and by providing a means through which farm families can supply themselves with goods and services not otherwise adequate or available, cooperatives can be an important aid in bringing to rural areas parity of income and parity of facilities." Brannan said.

STORM AIDS MOSS GATHERERS

The old adage--"It's an ill wind that blows no good"--held true during the recent tropical storm which swept lower Florida. It aided hundreds of moss gatherers by blowing thousands of pounds of moss from the trees to the ground, making it unnecessary for gatherings to pull it from the trees, reports the Florida Extension Service.

The sale of moss provides considerable ready cash for many farm families in Florida where there are several processing plants that buy hundreds of tons of moss.

USDA to Study Economic Effects of Farm Mechanization

The economic effects of further mechanizing cotton, sugar, rice, and dairy farming will be studied under the Research and Marketing Act of 1946, the U. S. Department of Agriculture has announced.

The work will be conducted by the Bureau of Agricultural Economics in cooperation with the Agricultural Research Administration and with State experiment stations in States where the commodity involved is important.

E. A. Meyer, administrator of the Research and Marketing Act, says that results of the work should enable farmers and agencies concerned with agriculture to keep abreast of technological developments, and it should also serve as a guide to more profitable farm management practices.

There is real need for this type of study, he says, both in the experimental stage and as new machines are first adopted by farmers. Meyer points out that such research will help farmers to determine the conditions under which new machines and techniques can profitably be used.

USDA Plans Disposal of Farm Labor Camps

Plans for the liquidation of Government operation of its 125 farm labor camps which have the capacity for housing nearly 70,000 white and colored migrant farm workers was announced last week by the Production and Marketing Administration of the U. S. Department of Agriculture.

Disposal of the camps is in accordance with the Farmers Home Administration Act of 1946 and Public Law 298 of the 80th Congress. The latter piece of legislation, which was approved by President Truman on July 31, requires that first consideration in disposing of those properties must be given their continued use as housing for agricultural workers. To meet this requirement, public or semi-public agencies, or non-profit associations of farmers in a community will have a prior purchase right.

The Department has until June 30, 1949 to dispose of the camps. This is to provide adequate time for interested eligible agencies to arrange for authorization and funds for the purchase and operation of the camps.

Most of the farm labor camps have been in operation for housing migratory or seasonal farm workers for a number of years. Some of them were established as early as 1935.

In June of this year, there were 40,000 white and colored domestic farm workers and their families and 5,000 foreign workers housed in the camps. There are two types of camps—permanent and temporary. The permanent camps numbering 54, are situated on Government-owned land. They have a total capacity for housing 48,600 persons. The temporary camps number 71 and have a capacity of housing 20,435. These camps are on leased land and are operated only during harvest periods.

It is estimated that colored farm workers make up nearly a third of the population of the 125 camps which are situated in 19 States. However, these workers are concentrated mainly in the southeast—Florida, North Carolina, and Virginia.

The Department points out that all operation of camps by the Federal Government must be discontinued after January 30, 1948. Under the law operation of any camp after that date may be continued only under contractual arrangements relieveing the Federal Government of financial responsibility in connection with the camp's operation. Any camp for which no arrangement to operate has been made by January 30 will be liquidated immediately by sale to the highest bidder. In order to accomplish liquidation as required, it will be necessary that all occupants leave these camps for which no arrangement has been made prior to that date.

Lack of funds will not permit Federal operation of camps under the farm labor program later than September 30 of this year. Several nonprofit grower associations have already indicated interest in obtaining the properties; up to now 23 agreements have been negotiated permitting such associations to continue operation of the camps after September 30.

Improves Recruitment of Nigrant Farm Workers

Although many unsatisfactory aspects of travel, housing, and working conditions of migrant farm laborers still exist, the North Carolina State Extension Service has developed a recruitment and placement plan which is making it easier for both worker and farmer.

How this new recruitment and placement plan is being carried out in that State is reported in the November issue of Extension Service Review, a U. S. Department of Agriculture publication.

Essentially, this plan which may be adopted by several other States is designed to take the gamble out of harvesting truck crops, including the multimillion dollar potato crop. The basis of the plan is adequate knowledge of the farmer's needs for workers during the harvesting season and of the availability of migrant crews.

The Extension Service farm labor specialist ascertains this information by keeping in close touch with the farmers and with the crew leaders of migrant workers. Then, by fitting migrant crews to harvesting needs the labor specialist is able to adjust the inflow of workers both to labor demands and housing accomodations. This not only assures shelter facilities for all, but it also makes for full-employment of workers while they are in a given area.

Without the information on crops and labor needs which the farm specialist provides, the crew leaders would not know exactly when or where their crews could be placed. For example, last year when there was no selective recruitment plan in operation in North Carolina, 9,000 migrant farm workers poured into that State three weeks before the potato crop was ready for harvesting. As a result, not only were these workers idle and unsatisfactorily housed for three weeks or more, but also, Florida farmers for whom they had worked were left in the lurch, because the migrants—in their rush to greener fields—left Florida before the crops were completely harvested.

An important feature of the new plan from the farmer's point of view is that it provides for selective recruitment. Workers and crew leaders are selected on the basis of previous performance.

Officials of the Department of Agriculture say that other States along the Atlantic Seaboard are expected to adopt similar plans very soon. Virginia tried the plan this year, but did not get started in time to make the fullest use of it.

The Fruits of Statism

One thing distinguishes American economic doctrine from all others. That is freedom of opportunity under the competitive system.

In both Europe and South America competition in rigidly restricted by government, by cartels and by other monopolistic forces. As Russell Porter writes in the New York Times, "In contrast to the relative freedom with which an American can find work or start a business, move from one place to another, or introduce a new line of goods-----no such opportunities exist abroad. Foreign trade associations of producers, wholesalers and retailers guard their vested interests jealously, keeping out new members and keeping non-members out of business in order to prevent 'destructive' competition. Trade unions join with trade associations to restrict competition."

This kind of monopoly, whether exerted by government or by private interests, inevitably paves the way for socialism. The state regulates more and more. Its fingers reach into every pie. Little by little it begins to expropriate businesses. It becomes the dominant influence in the economic life of the people. It becomes a major employer. The only possible end is some form of dictatorship.

Furthermore, the American economic system is the only one which has distributed its benefits to the masses of the people. In the super-state—whether it be of the Russian, German or Spanish pattern—the men at the top possess enormous powers, and profit accordingly.

All the rest of the nation struggles along on a subsistence basis. There is no opportunity to improve to save, to start an enterprise. Punishment for dissenters is swift and brutal.

That is the danger when government goes into business—when government tampers with free enterprise and the free market—when bureaucracy reaches for more and more power. We have only to look abroad to see the fruits of statism.

Dunjee Gets Life Membership in Oklahoma 4-H Clubs

Roscoe Dunjee, editor of the Oklahoma City Black Dispatch, and five other colored leaders of Oklahoma were recently awarded honorary life membership in Oklahoma 4-H Clubs in recognition of their contribution to 4-H Club work in the State, reports District Agent Paul Brooks.

The other recipients were: George Ragland, president of the State Chamber of Commerce, Mrs. L. L. Sawner, retired school principal, G. W. Davis, breeder of Aberdeen-Angus cattle, Dr. H. W. Conrad of Guthrie, and B. J. Wilson, editor of the Okmulgee Observer.

Teacher—"Freddie, your essay on 'My Mother' is exactly the same as your brother's, word for word."

Freddie—"Yes, sir. We have the same mother."

Pick a Fat Girl—Save Tax Dollars, Well, That's What an Expert Says

Washington—(UP)— Take a tip, men— demand your gals buxom and save some of those tax dollars.

That's what the agriculture department says anyway.

The department recently began wondering why it had to fork out nearly $90,000,000 in tax dollars last year to assure farmers a fair price for potatoes.

It gave Harry W. Henderson, information specialist in the production and marketing administration, the job of finding out.

Henderson conferred with department experts, dug back into musty statistical files and faithfully jotted down his findings in "Marketing Activities," a department publication.

The answer, it seems, is that people just aren't eating as many potatoes as they used to. And women are the chief offenders.

But don't smile, you men. It's all your fault. The reason women don't eat potatoes is because you want 'em slim and gazelle-like instead of buxom and practical.

The worst of it Henderson says, is that potatoes aren't the arch criminal in matters of feminine weight. But let him explain it:

"Styles in human figures (female, that is) since 1910 have changed from buxom to slim, and the medical profession has in the past encouraged this by warning us of the danger of excess poundage.

"Unfortunately, many people have the mistaken belief that potatoes are fattening and have cut down on their consumption."

Of course there are other reasons people aren't eating as many potatoes. They aren't using as much energy for one thing.

"Instead of walking to work or to a movie, we pile into an automobile," Henderson says. "Instead of doing the work ourselves, we have developed devices for the factory and home that do much of our work for us.

"So the demand for potatoes, as a substantial source of food energy, is hurt by our more inactive life."

If you don't think the situation is alarming, look at these statistics:

Between 1910 and 1913, the average American ate 168.88 pounds of spuds a year. In the 20's the rate dropped to 151.7 pounds per person. And now it's down to 134.6 pounds.

Potato production meantime has climbed from an average of 340,100,000 bushels in 1910-19 to an average of 363,000,000 bushels during 1930-39. Last year production was even larger, requiring extensive price support purchases.

So there it is, fellows. You can demand your gal slim and foot the bill for potato surpluses. Or you can take 'em plump and save some of those tax dollars.

Fear of Another Dust Bowl Clouds Parched Wheat Lands

Oklahoma City, Oct. 3—(AP)—The land is on the move once more over millions of drought-parched acres in Oklahoma and other states of the midlands, government exerts fear, bringing an ominous reminder of the Dust Bowl days of the 1930s.

Man may have pushed nature too far in the zealous quest for $3 wheat to feed the world's hungry, they say.

K. D. Blood, Federal crop statisticsan, said yesterday that if the widespread drought continues through the autumn months, the picture will be "alarming."

Conservationists who fought the battle to save Oklahoma's soil have their fingers crossed as they keep one eye on the cloudless skies, and view with apprehension the acres of newly-plowed earth which is turning to powdered dust.

The blow is slight yet, but unless the rains come soon, conditions will be right for a return of the terrifying spectacle of deserts moving through the great plains country of the southwest.

Although statistics are not yet available, Blood said Oklahoma's acreage plowed up this year for wheat planting may be the greatest in history.

Last year, more than 7 million acres were planted to wheat in Oklahoma, he said, with 6,757,000 acres harvested for an all-time record crop of 104,734,000 bushels.

In the drought years of 1933-36 the highest total was 37,202,000 and the lowest 28,272,000 bushels.

As a result of good production and rising prices, the total acres plowed for wheat have gone up each year.

Conservationists are afraid that many acres that should have been devoted to soil-saving practices have been torn up by the plow in the mad race for more wheat.

If sufficient moisture falls this winter, the 1948 crop yield may break all records in Oklahoma. If there is no rain, the prospect is for deep trouble in the plains country.

The rains which normally fall in late August to break the summer heat failed to come this year. Then September opened with an extra ordinary heat wave and the drought continued.

Blood said Oklahoma was no exception, as similar conditions extend throughout the "bread basket" Middle West.

With the rest of the world starving for grain, a continued drought and crop failure this year would bring not only acute conditions to the Southwest, but would have critical international implications, Blood pointed out.

2,000 Trees Slated To Produce 12 to 15,000 Bushels of Apples

Tennessee's apple crop is finishing well above the average in both quality and quantity, according to officials of the State Department of Agriculture. This year's crop is estimated at approximately 360,000 bushels as compared to 337,000 bushel average from 1935 to 1945.

The increase is reflected in the 53-acre orchard of W. E. Stephens, which is located on Pettus Road, just off the Nolensville Road. The yield from the 2,000 trees is estimated between 12,000 and 15,000 bushels, a greater per cent of which are grading No. 1.

The Stephens orchard, one of the largest commercial apple orchards in this section of the state is managed by A. F. Goodwin. He has worked there for the past 18 years and helped to set a greater portion of the trees when it was known as the Armstead orchard. The trees range in age from four to 23 years. While the largest wields are made on the older trees, some producing as many as 47 bushels, a number of the trees set four years ago produced as many as six pecks of choice fruit this year.

Well Managed Orchard

"The Stephens orchard is one of the best managed orchards in the state," according to J. C. McDaniel, state horticulturist.

"They, like many other orchardists in Tennessee have learned that in order to produce first grade fruit management plays a great part," he said.

The apple crop was sprayed 11 times with an underground spray system, which provides sufficient pressure to force the insecticide and fungiside throughout the body and leaf surface of the tree. The chemicals are prepared in a large vat and pumped from there to all parts of the orchard. Insufficient pressure often reduces the effectiveness of spraying.

"While 11 different sprayings in one year might seem a lot to the home orchardist, it requires in most cases to produce fruit free from insects and insect injuries, the kind consumers demand on the market." McDaniel said.

"While a home orchardist might produce desirable fruit for home consumption with half that number of applications, he will also have more fruit and tree injuries from the insects," the horticulturist said.

The Stephens orchard was sprayed with DDT this year for the first time to control the codling moth. It was very successful. They also used a dinitro spray for control of the red spider and mite which the average orchardist often fails to control. As a result a greater per cent of the crop is grading choice.

Although 15,000 bushels would surely make a "heap" of apples, they all find a home on the local market," W. E. Stephens, owner of the orchard said.

"For the past several years, it has not been of the apples going to the market but rather the market comes to the apples," he said.

Each Sunday during the fall there is a continuous stream of cars entering and leaving the orchard. Some times as many as 1,500 visit there in a single Sunday. While most everyone buys either apples or cider, a purchase is not a prerequisite to a cup of the sweet cider served each visitor.

Approximately 15,000 gallons of cider will be made at the mill which has a capacity of 600 gallons in an eight-hour day. As many as 30 men and women are employed at the orchard during the harvesting season, while the manager and one worker is the only full-time employe.

Dallas Farmers Turning to Livestock Production

Income from milk and cattle is replacing that from cotton in the Black Belt soils of Dallas County.

It was just a few years ago that Negro farmers in the county began producing livestock. Now many of the cattle sold at the weekly stockyard sales were grown by them.

These farmers are entering the livestock business on a sound basis. Good pastures and plenty of high quality home grown hay and grain are to be found on the farms that produce milk and beef. Purebred bulls have replaced scrubs on 35 farms in the past year. Dairy and beef herds are being graded up rapidly by better breeding.

During the past three months farmers in Beloit, Orrville, Safford, Bogue Chitto, Massillon, Marion Junction, and Browns Communities have put out record amounts of lime and phosphates in a pasture improvement program. These pastures were fertilized and seeded according to recommendations of the Black Belt sub-experiment station at Marion Junction.

The winter grazing program with oats and Caley peas has been adopted on many farms. S. W. Boynton, county agent, reports that the winter grazing program has given a great boost to the income of both dairymen and beef cattle raisers.

Farmers in Bogue Chitto and Safford Communities have purchased 60 high grade Jersey cows to raise the milk production of dairy cows.

Home-Made Articles Help with Expenses

Mrs. Bettie Bell of Livingston, Sumter County, makes her home-grown and home-made products take care of the household expenses. Beside her year round garden and poultry, Mrs. Bell crochets bags which sell for $12.50 and up. She also makes hats.

At a recent exhibit Mrs. Bell won first prize on her sewing. She showed a quilt, several aprons, and a baby dress made from sacks. She also demonstrated how to improve homes through the use of home-made articles.

Mrs. Bell has made furniture for her entire house from boxes and other inexpensive materials. For coverings she used scrap material.

From her year round garden Mrs. Bell sells vegetables to neighbors and furnishes vegetables for one of the cafes in Livingston.

Pioneer Rural Worker Leaves Record of Worthwhile Service

The Alabama Extension Service lost one of its pioneers when F. G. Manly died on May 13. Here is a brief descrition of Mr. Manley and his work:

Cheerful and aggressive to the very end of his long and serviceable life, Frank G. Manly never missed an opportunity to lend a kindly word of advice or champion a worthy cause. Being deprived of both legs during the last six years of his life never dulled his enthusiasm, nor his will to see things around him progress.

Coming to Tuskegee in 1902 from Raleigh, North Carolina, "Frank," as he was affectionately known by his many friends, served as a member of the agricultural faculty of Tuskegee Institute until 1907. From 1907 to 1913 he was manager of the "Benson Development Project" at Benson, Alabama in Elmore County.

Returning to Tuskegee Institute in 1913 he resumed his duties as agricultural instructor until 1918. The expansion of farm demonstration work that year, as a aresult of World War I, and the demand for food and other farm products appealed to Mr. Manly as a wider field for service. Consequently he resigned his position with the Institute to accept a position as agricultural extension agent of Elmore County.

The development of Negro initiative, both on the farms and in the urban areas of Elmore County was greatly influenced by his leadership. As extension work became more wide-spread in Alabama and new members were added to the staff, it was Frank Manly's kindly and fatherly advice that helped many to get the right perspective of the job to be done.

The extension agents remember the vivid picture painted by Mr. Manly in one of the summer school sessions for the county agents during "horse and buggy days." His ability to convert from that era and become one of the outstanding agents during the prewar years attested to his adaptability and resourcefulness.

Scores of boys and girls who came under his influence have him to thank for the encouragement and assistance which carried them through school.

In 1940 Mr. Manly retired from active duty with the Alabama Extension Service. That same year he received a citation from the Alabama County Agents Association for more than twenty years of distinguished and meritorious service.

Cotton Machines and Small Farmers

By J. R. Otis

A number of the readers of THE NEGRO FARMER have asked me from time to time to write on the subject "Machine Production and the Small Farmer." It is not an easy thing to do in these columns. However, after repeated requests, I have decided to write a series of three articles on this suject.

In the first, I will deal with where machine production is likely to take place. The greatest change i nmachine production in the South right now is in the flame thrower and cotton picker. These machines are the answer to the need for low production cost on cotton so that the market for this important crop can be held.

For the time being we may expect cotton to be produced by machines on the flat to slightly rolling cotton lands of the state. These areas are found in the Tennessee Valley, the table lands on mountains in northeast Alabama, and in central Alabama.

Please note that I said "cotton land." Farmers on the red well-drained cotton land east and north of Montgomery, for instance, planted cotton two to three weeks earlier this year than farmers on the less well-drained grey lands in Macon, southern Lee, and Russell Counties. For this reason the crop on the better cotton lands will suffer less from boll weevil damage because it will fruit and mature earlier. This advantage is one of the main reasons why cotton will be produced by machines on the good cotton lands. Cotton just simply is not planted in black soils of the Black Belt except by a few farmers who refuse to believe that it can't be grown successfully there.

These cotton lands will also take and use large amounts of fertilizer per acre to give high yields so that the costs of producing the crop will be lowered. Cotton producing machines then will be used on these good cotton lands for two reasons: (1) The land is generally flat and is adapted to cotton producing machinery. (2) The land gives high cotton yields, thus making it possible for Alabama cotton to sell at a price that will compete with cotton grown in other areas and with synthetic fibers.

On good land the number of tenants is usually highest and absentee landlord holdings also are high. Farming is a business which does not give high returns to investors. Thus, those who invest in farms always see to it that they invest in the best land. Even then, the best land is taken over in time by the best farmers during years of low prices. Such farmers live on the land and farm for a living.

The use of machinery calls for much skill and a larger number of acres in cultivation. A large farm is a greater risk than a small one when it is run under poor management. Therefore, good sized farms on which modern machinery is used call for good management. Cotton will most likely be produced by machines on the best cotton land because good farmers are better managers.

What will becomee of the little farmer who does not use machines in producing cotton? The difference between a big farmer and a small farmer is in acres of land worked and the income per farm. Prices farmers received for cotton in past years—good and bad—have been such that small farmers have been able to exist.

What will hapen to the small farmer in this day of machine production will deend on a numbeer of things. One of them is how long that machine production will carry the price of cotton. Another is whether or not small farmers will continuee to be satisfied with low incomes. If the price of cotton drops to six or seven cents per pound and stay there for some time, small farmers may turn to other cash enterprises that will give them enough income to enjoy a decent standard of living.—NEGRO FARMER.

Farmers Urged to Conserve Grain

A campaign to save grain thru more efficient livestock feeding practices was announced last week by Secretary of Agriculture Clinton P. Anderson as a means of making more grain available for relief feeding abroad.

In announcing the drive, Secretary Anderson said through more efficient use of livestock feeds, farmers and ranchers will make a real contribution toward increasing the volume of grain for export. At the same time, he said, holding down the price of grain will mean important savings to farmers.

Champion Steer Brings $14,967

Ronald Paasch of Walnut, Iowa, won grand champion honors with his Angus steers at the American Royal Livestock Show. He is $14,967 richer today. That is what the American Meat Company paid him for the steer at $11.50 per pound.

The price for the champion steer was considerably below $42,000 paid for last year's champion, which was an all-time record for the national event.

WOMAN'S PAGE

Helpful Household Hints

BAKING RULE

A never-to-be-forgotten rule: When preparing to bake a eake, allow all ingredients. especially eggs, lard, and liquid to come to room temperature before beginning. Their "combineability" is increased tremendously, and the texture of the cake improved.

You know what a chore it is to keep the piano keys clean. A bit of cream wax does wonders in making them smooth and free from dust and dirt.

HARMONY IN THE KITCHEN

In seleeting shelving paper for your kitchen, choose a pattern which supplements the other colors in the room—that is to say, the colors in the lineoleum, in the wallpaper or paint, in the curtains and furniture. In every case the shelving should be selected so that its eolor and pattern help tie the entire color scheme of the room together into an artistic whole.

Modern decorative shelving is made up of a colorful border and white shelf-lining paper, all in one place, so that you merely lay the paper on the shelf and fold down the colorful edge. The best shelving has a so-called "double edge," that is to say, the border is doublethiek to prevent wilting or curling.

Insufficient rinsing leaves tattletale marks on both white and colored clothes.. No matter how thoroughly clothes are washed, soap particles not removed by rinsing will give white things a dingy appearance and will dull the brightness of eolored fabries.

SPARKLING GLASSWARE

Your glassware ean be made sparkling bright and really sanitary by washing it in a solution of baking soda. The soda solution removes cloudy spots and foggy smears by emulsifying the film that holds them.

TO REMOVE EGG STAIN

Egg stains on table linen or any washable material should be soaked in cold water before washing, as hot water wil set them. If they are on silk, they usually can be removed by rubbing with table salt.

COOKERY TIP

You can keep cupcakes, cookies, rolls or muffins longer if they are baked with honey. Honey will keep these foods moist and prevent their staling if you wrap them individually or in small lots for convenience in serving, whether you plan a snack while driving or a picnie lunch.

TASTY COMBINATION

Combine diced canned eling peaches with crushed pineapple for the fruit additions of homemade ice ereaam.

INDIAN SUMMER FROSTING

Creamy, luscious! Blue Plate Peanut Butter gives pleasing taste of fresh-roasted peanuts

1-4 cup Blue Plate Peanut Butter
1-4 eup Blue Plate Margarine
1 tsp. vanilla
Pinch of salt
3 1-2 cups sifted eonfectioners' sugar
4 or 5 tablespoons milk

Measure Blue Plate Peanut Butter and Margarine into mixing bowl. Add vanilla, and blend. Gradually stir in sugar, salt, and milk, adding only enough milk to make frosting spread easily. Use for your favorite two-layer cake or with reeipe below. The richer flavor of Blue Plate Peanut Butter makes this a family-pleaser, for sure.

Dried apricots and peaches are especially rich in iron and copper.

CHEESE NOODLE RING WITH CREAMED SHRIMP

1 8-ounce package medium noodles
3 tablespoons butter
1-4 cup minced onion
4 tablespoons flour
1 teaspoon salt
1-4 teaspoon paprika
2 cups milk
3 eggs separated
1 teaspoon prepared mustard
1 cup grated American cheese

Cook noodles in boiling, salted water, until tender, about 15 minutes. Drain and rinse in hot water. Meanwhile, melt butter in saucepan, add onion and cook slowly for 5 minutes. Stir in flour and seasonings; gradually add milk while stirring and cook over low heat until smooth and thickened, stirring constantly. Beat yolks; add a little hot sauce to yolks and blend Stir mixture into remaining sauce, add prepared mustard and grated eheese, remove from heat and stir to blend. Add hot sauce to drained noodles, mixing well. Beat egg whites until stiff and fold into mixture. Pour into a well-greased 1 1-2 quart ring mold and bake in a pan of hot water in a moderate oven 325 degrees, for about 45 minutes or until lightly browned. Turn out on hot platter and fill center with creamed shrimp. Serves 6 to 8.

SPEEDY TWO-EGG CAKE

2 cups sifted cake flour
2 1-2 tsps. double action baking powder
1-2 tsp. salt
1 1-4 cups sugar
1-2 cup Blue Plate Margarine
1 tsp. vanilla
2-3 cup milk
2 eggs

Sift dry ingredients into mixing bowl. Add Blue Plate Margarine vanilla, and milk. Beat 2 minutes. Add eggs, beat 1 minute more. Bake in 2 greased layer pans about 25 minutes in moderate over (375 degrees F.)

NOODLES WITH RELISH

1 tablespoon salt
3 quarts boiling water
3 ounces medium noodles
3-4 cup condensed mushroom soup
1-2 eup milk
1-4 teaspoon salt
1 teaspoon Worcestershire Sauce
1-4 cup cooked diced bacon
2 teaspoons piekle relish

Add 1 tablespoon salt in actively boiling water. Gradually add noodles and boil until tender (about 6 minutes). Drain and rinse. While noodles are cooking, combine soup, Sauce. Mix well and heat thoroughly. Fold in noodles. Just before serving, fold in bacon and pickle relish. 2 servings.

NECTAR CAKE FROSTING

Heat 1 1-2 cups aprieot whole fruit nectar to boiling. Combine 1-4 cup cold water, 3 tablespoons cornntsareh, 1-4 teaspoon salt, and stir to blend. Add to hot nectar and cook and stir about 1 or 2 minutes or until thick. Remove from heat, eool slightly, add 1-2 teaspoon lemon extract, 2 tablespoons finely cut maraschino eherries, 16 marshmallows, and 3 tablespoons butter or margarine; beat smooth; cool.

This yields sufficient frosting to spread between layers and on top of a 2-layer cake.

SUNDAY NIGHT SNACK

Scrambled eggs are good toast toppers for Sunday night hangerson. Make them extra delicious and distinctive by adding cubed avoeado just before removing from the heat. Heap on hot buttered toast and sprinkle with finely ehopped parsley.

Among the dried fruit family, raisins and figs contain the highest per cent of fruit sugar. Fruit sugar, or fructose, is already in a form available to the body as an immediate source of energy.

Your salesman is a Want Ad.

VERSATILE VEGETABLE

Swisschard is a member of the beet family, but is used more as a green than a root vegetable. Its large, curly leaves and fleshy, succulent stalks have an agreeable and distinctive flavor, which will be welcomed by the housewife seeking a touch of something different in her menus. There are a number of appealing ways of preparing this vegetable. While the leafy portion is usually cooked like spinach, the tender stems can be served as you would asparagus. The small crisp leaves may be used raw in salads. They are somewhat similar in taste to Romaine lettuce.

A NEW PIE CRUST

First new pie crust recipe in years!

You don't use ice water. You don't use boiling water. Mixing ingredients at room tempeerature makes the difference! Quieker-blending, better-kceping "Pastry-B l e n d' makes it possible. For "Pastry-Blend" is pure lard in Armour's new. exclusive formula that keeps without refrigeration. Easy as 1. 2, 3.

1. "Pastry-Blend" Lard makes the flavor rich! Measure 2 cups all-purpose flour without sifting. Sift with 1 tsp, salt. Add 2-3 cup new "Pastry-Blend" Armour Star Lard that you have kept at room temperature. Remember. "Pastry-Blend" Lard keeps its mild. delieious flavor. always. It gives the rich taste to your pie crust!

2. Light handling makes it flaky! Blend mixture with pastry blender, 2 knives or your fingers. Here's where "Pastry-Blend" goes to work for you! It blends with flour like lightning. And less handling ineans flakier crust. Stop mixing when the lard is cut into pieces the size of small peas. It won't be long!

3. Scant water makes it tender! Add only 4 tbsps. water (room temperature). Sprinkle over flour mixture—pressing mixture with knife until it just holds together.. The smaller amount of water you use with "Pastry-Blend" gives you more tender crust. Divide mixture into 2 portions. Roll out on pastry canvas or lightly-floured board. Makes one 9-in. double-crust pie. Bake apple(or ny fruit) pie at 45 degrees F. for 10 minutes, then at 350 degrees F. for 30 or 40 minutes.

"Pastry-Blend Lard comes in 1-lb., 3-lb., 4-lb., and economy-size 8-lb cartons.

PICNIC SANDWICHES

Sandwiches for picnics may be made several hours ahead of time, wrapped in wax paper, and placed in the refrigerator. Dainty party sandwiches made some time in advance of the festivities keep their freshness when stacked neatly in a pan, eovered with a damp cloth and put into the refrigerator to chill.

WATERPROOF WALL PAPER

To waterproof wall paper take one part schellac, one of borax and eleven of water. Mix well and strain. Apply to the wall paper.

When this is dry brush softly with a dry brush.

Shred crisp green cabbage finely and eombine with wedges of ripe olives and a well-seasoned mayonnaise. Serve in seooped tomato cups. Garnish with mayonnaise and a sprinkling of minced parsley.

GARNISH FOR LAMB

Mint-Meringue Pears make a festive, fluffy garnish to serve with lamb for a "company meal." Beat 2 egg whites until stiff. Add 1-2 cup mint jelly and continue beating until well-mixed. Put some of the mint-meringue mixture on each pear half, and place in the oven or broiler just long enough for the meringue to become lightly browned. Serve one pear half with each serving of lamb.

CONSOMME VS. BOUILION

Many a new homemaker is uncertain as to the difference between canned consomme and bouillon. One of the best-known eanners of these products explains that their consomme and bouillon are both made of broth simmered from selected beef and then strained clear. Both have vegetable juices added, but the combinations of vegetables juices are different in each ease, which makes for a little difference in flavor ad color, the bouillon being a somewhat deeper amber.

The consomme jells in the can when placed in the refrigerator, because extra gelatin has been added to it. The bouillon does not jell.

FRUIT SOUFFLE

Place in a saucepan 1 package of vanilla pudding. Gradually add cup water, stirring until smooth. Cook over medium heat until thick and clear. Add a mixture of 3 tablespoons lemon juice, 1-2 cup orange juice, add 1 mashed banana. Remove from heat. Cool slightly. Beat 2 egg whites until stiff, then gradually beat in 2 tablespoons powdered sugar. Fold this into pudding mixture. Chill. Serve in sherbet glasses, topped with grated orange rind.

FISH PATTIES WITH MEXICAN SAUCE

2 cups uneooked white fish, flaked
1-4 cup melted butter or margarine
2 tablespoons lemon juice
1 cup soft bread crumbs
2 eggs. unbeaten
1 tablespoon chopped parsley
3 tablespoons chopped onion
1-2, teaspoon dry mustard
1 1-2 teaspoon salt
1-2 teaspoon pepper

Combine all ingredieents and mix thoroughly. Shape into round cakes Brown on both sides in hot fat. Serve with Mexican sauce. Makes 6 servings.

Mexican Sauce

2 tablespoons butter or margarine
1 tablespoon chopped onion
2 tablespoons chopped green pepper
1 clove garlic, finely chopped
2 tablespoons flour
1-2 teaspoon salt
1 teaspoon chili powder
1 eup canned tomatoes
1 cup water
1 bouillon cube

Melt butter in a saucepan; add onion, green pepper and garlic and cook until lightly browned. Add flour, salt and chili powder and stir until smooth. Stir in tomatoes and water slowly; add bouillon cube. Cook, stirring constantly until sauce is thiekened. Makes 1 2-3 eups.

SALAD SUGGESTION

Marinate whole-kernel corn and diced green pepper in French dressing. Combine with wedges of ripe olives. Fill hollowed-out small tol matoes with olive-vegetable mixture. Serve as salad or garnish for eold meat platter.

CRANBERRY-APPLE RELISH

4 cups fresh cranberries
2 oranges, quartered and seeded
1 lemon, quartered and seeded
2 apples, peeled and diced
2 eups sugar

Put cranberries, oranges and lemon through food chopper. Add diced apples and sugar; blend well. chill in refrigerator before serving. Makes appriximately 5 eups.

SEWING TIP

Bound or two-piece buttonholes are best for jersey. Worked buttonholes are likely to stretch or even ravel.

A pinch of salt placed in coffee before boiling brings out the full flavor.

DOWN EAST APPLE DUMPLINGS

2 cups sifted all-purpose flour
4 teaspoons baking powder
½ cup sugar
½ tcaspoon salt
4 tablespoons shortening
¾ cup milk (about)
4 large baking apples
2 tablespoons butter or margarine
1 tablespoon lemon juice
1 teaspoon grated lemon rind
¼ teaspoon cinnamon
Few drops red food coloring
¼ cup hot water

Sift together flour, baking powder, 2 tablespoons sugar and salt. Cut in shortening with 2 knives or pastry blender. Add enough milk to make a stiff dough. Roll out ⅛ inch thick on lightly floured board; cut in 6 inch squares. Wash, pare and core apples. Place apple in center of square. Fill center of apple; fasten with toothbutter or margarine, lemon juice, lemon rind, cinnamon and remaining sugar. Add red food coloring. Draw corners of dough toward center of apple; fasten with toothpick. Place in 8-inch sqquare pan. Chill in refrigerator 1 hour. Add hot water to bottom of pan. Bake in hot oven (450 degrees), 15 minutes; reduce temperature to slow (325 degrees), bake 30 minutes longer.

BUTTERSCOTCH OATMEAL CASSEROLE

Large Casserole: Put 2 cups rolled oats (quick or old-fashioned) and 1 teaspoon salt in casserole. Add 4 cups boiling water, cover and bake in a moderate oven (350 degrees) 15 or 20 minutes. Top with ¼ cup chopped nutmeats before serving.

Individual Casserole: Plaec ½ cup rolled oats and ¼ teaspoon salt in each small baking dish. Add I cup boiling water, cover and bake in a moderate oven (350 degrees) about 15 minutes. Top each serving with 1 tablespoon brown sugar and a few chopped nutmeats before serving.

VEAL A LA KING IN PASTRY SHELLS

2 eups cooked veal, cubed
4 tablespoons flour
1 cup veal stock
1 cup milk
½ eup dieed celery
1 small can button mushrooms
½ cup peas
1 pimiento, diced
1 green pepper, diced
Salt and pepper
Currant jelly

Melt fat and stir flour into it. Gradually add the liquid, stirring until the sauee is thickened. Then add diced veal, vegetables and season with salt and pepper. Serve in pastry shells. Place a pieee of currant jelly on eaeh serving. Serves 6.

TOMATO GLORIES

6 large tomatoes
2 cans deviled ham
1 cup chopped celery
1 dozen stuffed olives, sliced
2 hard-cooked eggs, sliced
2 tablespoons salad dressing

Remove thin slice from tops of tomatoes and scoop out center pulp. Chop fine and mix with remaining ingredients. Refill tomatoes, top with parsley sprigs and chill until ready to serve.

CONVERT OLD TRUNK

If you have an old trunk it may make a perfeet toy chest for your youngsters. Give it two coats of dead white paint, leather straps, hinges and all. Then antique the trunk with burnt unbar.

Clean your toaster when it is cold and then use only warm soapy water on a cloth. Never immerse it in water.

WHITER FISH

To make fish firm and white, add a little lemon juice to the water while boiling.

THE MODERN FARMER

VOL XX. NASHVILLE, TENN., DECEMBER 15, 1947 No. 11

THE BYRD NEST

By Rev. Bernard O. Byrd —Guest Columnist.

TAKE A NEW START WITH GOD

Since July or thereabout, the articles appearing in this column have been inspired from studies in the experiences of Noah in building the ark. Naturally the next thing which should claim our attention is the beginning of things after the flood. Inasmuch as the entire anti-deluge civilization had been destroyed, facing Noah was the task of building anew the order of human events. Inasmuch as God had washed away all signs of human accomplishments. Noah was dependent upon the Divine Father for direc-

"Be fruitful and multiply and replenish the earth," said Jehovah to the head of this lone family which survived the flood. Speaking generally it meant that God wanted Noah and his sons to be productive, to be progressive, and to be restorative. To these three ends, every man is obliged, since God is expecting every person whom he sends into the world to produce something by using the talents he has. Furthermore, each is expected to increase the things he handles or uses. These things are borne out in the Scriptures which tell of the barren fig-tree, and the commitment of talents to servants. Again we must admit that God expects each to re-establish the helpful things of the earth which may have been destroyed. To sustain this claim, we need only to refer to the works of Nehemiah or the lesson learned in the resurrection of Christ.

However great the service may have been that was rendered by the ark, God did not intend for the little family to remain in that ark. The door was opened and they were called out that they might not dwell in the confines of an ark which had been good, but that they might face anew opportunity to expand into greater things. Without a doubt, Noah cherished the ark which had brought salvation from the waters of the flood, but he realized that it was not a place to remain forever. Even today, men must realize that life is something which uses opportunities and utilities by series. We are on a pilgrimage and must realize that though a bridge does a good job of carrying us over a stream, we cannot make the proper progress if we must carry the bridge along with us when we have no streams to cross but are approaching mountains and deserts. A bridge may carry one across the water, but it is no good when one approaches the mountain or the desert. The writer dares to step out on the limb by saying that there are among us, many leaders who have done well in carrying groups across streams and mud pits, but who do not know that we have passed that stage of experience and are now at the foot of the mountain ready to move upward. They have been very good in crossing the mud pits and raging waters, but they have not the needed qualifications for great advancement. Such leaders should realize that they have played their parts well and should not be willing to let the men with climbing

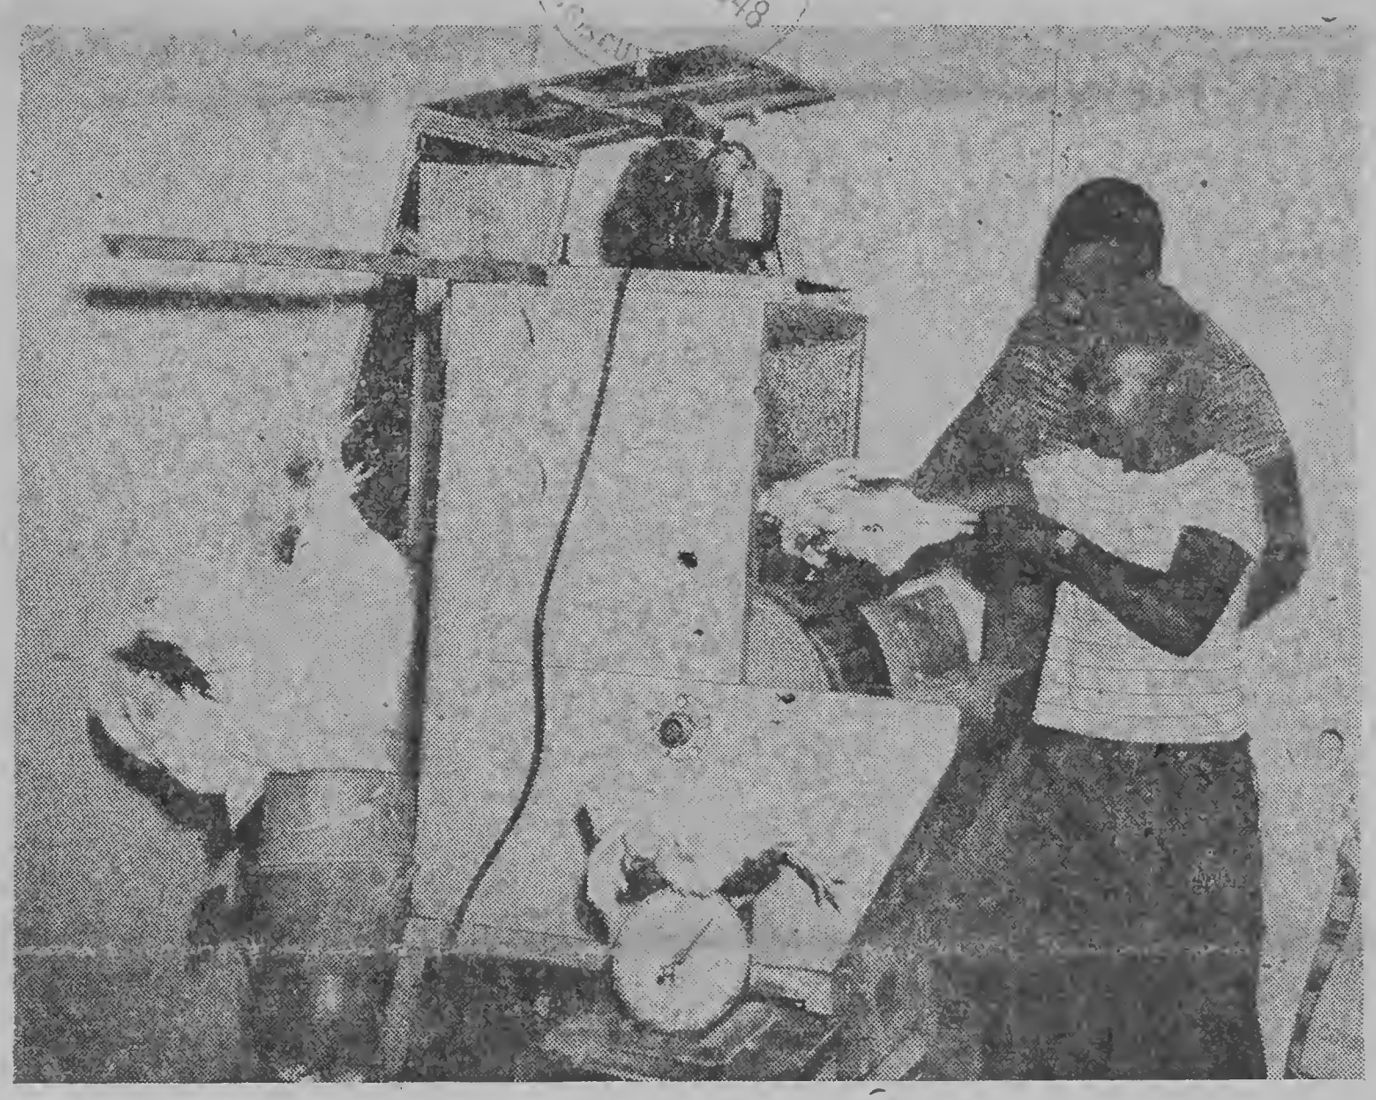
High School Teacher Shifts To Poultry Farmer In Arkansas

Experiment Leads to Profits



Henry W. Foster, former Pine Bluff, Ark., high school teacher, who began raising poultry as a biology experiment, shows his son, Henry, Jr., how to operate their mechanical feather picker. Foster sells eggs and dressed broilers to local hotels and restaurants. Last year he sold 4,000 dozen eggs and 15,000 dressed broilers, netting for his labor about $8,000. Henry, Jr., helps only during the summer when he is home from boarding school.

—USDA Photo

Henry W. Foster Assisted By Son, Nets $8,000 Per Year

From $125 a month as a teacher in the Pine Bluff, Ark., colored high school to $8,000 a year as a poultry farmer is the shift which Henry W. Foster has made within the last seven years.

It all started in 1940 when Foster, a thorough-going biology instructor and championship football coach, decided to have his class conduct an experiment in the cross-breeding of poultry as a means of increasing egg production.

The class secured a small flock of White Plymouth Rock and Black Minorcas. By cross-breeding the birds, the students not only confirmed the validity of their textbooks with respect to egg production, but they also confirmed their teacher's long-time hunch that with good layers, money could be made out of eggs.

Netting a neat little sum for the class from the sale of eggs and cull layers, Foster decided to make the poultry experiment a permanent part of biology laboratory work. Becoming adept at handling chickens, he soon joined up with the poultry instructor at Ark., State college, situated across town, and together they expanded the project and made it a part of the college's poultry experimental work.

The expanded project included broilers, fryers, and eggs. By the time Foster really was becoming interested in broiler production, the War Department began calling for chemists to man munition plants. Taking leave from his teaching post, he served as a chemist in a nearby plant.

After the war, the budding poultry farmer resigned from the school system and went into poultry on a full-time basis. By the end of 1945, he was feeding 250 baby chicks into his battery brooder assembly line every week, and was marketing from his brooders about 225 dressed eight-week old broilers. In

Three Johnston County Farmers Have Become Members Of 100 Bushel Club

Smithfield, N. C.—Three Johnston County Negroes—an adult farmer, a woman seed grower and a 4-H club member have become members of the state 100 bushel club for producing more than 100 bushels of corn on an acre this year. The three who topped the 100 bushel goal were Mrs. Thelma Sanders of Clayton, Route 2; William McClamb of Smithfield, Route 1 and Melvin Archibald of Smithfield, Route 1 and 4-H club member of the Four Oaks club.

Yields, determined on a 25 per

Portraits

DECEMBER

December is the final month . . . Of every passing year. . . And mostly it is famous for . . .Its friendly Christmas cheer. . .The warmth of greetings that arrive . . . In person and by mail . . . And all the pretty windows where . . . The presents are for sale . . . The sound of sleigh-bells in the snow . . . A moment more to pause . . . And put a penny in the pot . . . For some poor Santa Clause . . . December is the happy month . . . When children say their prayers . . . And go to sleep with golden dreams . . . Of dolls and teddy bears . . . But also it is time to think . . . . Of what the year has meant . . . And whether it was wasted or . . . The weeks were wisely spent.

Farms Of Nonwhite Operators Increased Over Six Per Cent From 1940 To 1945

Washington, D. C.—In the State of Florida, the total number of farms of nonwhite farm operators increased from 9,758 to 10,435, or 6.9 precent, between April 1, 1940, and January 1, 1945, according to final figures from the 1945 Census of Agriculture released today by Director J. C. Capt of the Bureau of the Census. The rise of 677 in the total number of nonwhite-operated farms in the 5-year period, 1940 to 1945, reflects a gain of 952 in the number of owner-operated farms, a gain of 6 in the number of man-

New Look For Lowly Potato Takes Shape In Agriculture Department Laboratories

By Arthur Adson

Washington —(AP)— What the potatoes of this country need is a new look.

And the department of agriculture, the best friend the potato ever had, is out to make sure that it gets one.

Maybe you always have thought that:

1. The potato is okay as it is, or
2. As far as the potato is concerned, you can take it of leave it.

It's this second proposition that has the agriculture people as pale and sickly looking as, well, restaurant potatoes.

Too many people are leaving it.

So, says a bulletin from the department of agriculture, a research program has been started to see if the potato can't be improved from a consumer's standpoint.

By the time they have finished their work, the agriculture specialists hope they can tell which potato is best for baking, for boiling, for frying, for salads.

If you think getting excited about a potato is sort of silly, you don't know your potatoes.

They're the No. 1 table product in this country, and a principal food in many parts of the world.

On the average, every man, woman and toddler in the U. S. eats potatoes at the rate of three bushels a year.

Though they have become known as "Irish potatoes, that's a bit misleading. Sure, and the Irish are fond of them. But are they not native American, having originated on the high plateaus of Chili and Peru?

Potatoes and history go together like potatoes and gravy.

A potato famine in Ireland sent the U. S. one of its largest groups of immigrants. A fuss over Bavarian food supplies brought on the potato war of 1778-1779.

And in this country, during

Small Farmers Face Tough Mechanization Problem

Farm tractor custom work, enlargement of farms, and formation of cooperatives offer possible solutions to the tough mechanization problem which small farmers—white and colored—now face, says the South Carolina State Extension Service.

The question as whether or not small framers can compete effectively with large operators in a mechanized agricultural economy has been raised by Extension Service of South Carolina as a result of a study which shows that large operators are now employing farm machinery at lower per acre eost than small farmers.

The study was made by the Bureau of Agricultural Economics and the State Experiment Station and covers the use and costs of tractor power on 131 farms of various sizes in Anderson County, S. C., last year.

Results of the study show that there was one tractor on small farms last year to each 50 acres of cropland; on farms with between 80 and 110 acres of cropland, there was one tractor to each 89 acres of cropland; on large farms (120-279 acres of cropland), there was one tractor to each 122 acres; and on very large farms (280 acres of cropland or more), there was one tractor to each 207 acres.

Extension Service points out that this tractor-to-size-of-farm relationship means that the investment in power and equipment was relatively very high on small and medium-sizeed farms last year. Money tied up in tractors alone on small farms was $14.52 per acre, as compared with only $4.03 per acre on very large farms.

The study also shows that the total investment in power and equipment on small farms was $49.54 per crop acre last year, $34.-93 on medium-size farms, $28.25 on large farms, and only $16.99 per crop acre on very large farms. The cost of power (tractor and mule) on small farms averaged $9.72 per crop acre last year; on very large farms it averaged only $5.92.

In the light of these facts, Extension Service of South Carolina has suggested that custom farm work with tractors, enlargement of small farms, and formation of eo-operatives may offer at least a practial solution to the problem of high per acre machinery costs for small operators. Through these means, the agency believes that some small farmers can take advantage of the benefits of mechanization.

The agency warns, however, that opportunity for custom work is likely to become increasingly limited as more tractors and other machinery becomes available. Operators of small farms are advised to proceed with caution in making investments in tractors and tractor-drawn equipment.

Nevertheless, another hopeful outlook for small farmers in a research project on the developement of farm machinery adaptable to small farms. This project is being carried out under the Research and Marketing Act of 1946.

New Pest Killer to Protect Crops

Philadelphia—(UP) —A new insect killer, described as possibly an overall single weapon for man in his battle against food pests, was announced yesterday by the Amerlean Cyanamid Co., of Stamford, Conn.

This new inseeticide, claimed to be from five to 25 times more powerful than DDT is known as Thiophos 3422, and is an organic phosphorous eompound.

A total of 15 papers, reporting on the new insectieide's powers to proteet food erops against insects, was delivered at the eastern meeting of the American Assoeiation of Eeonomic entomologist. The papers told of the work at 75 agricultural experiment stations, ineluding federal institutions.

Scientists of the eompany said that the new killer would be available for the 1948 erops, but that for the present it will not be recommended for use in the home.

In tests so far, the new insecticide kills such pests as the European red mite and other insects that damage apples: the corn borer, the potato aphid, the cabbage and cotton aphid, the Mexican bean beetle, bean leafhopper, bean aphis, onion thrips and grasshoppers.

The Cyanamid scientists said "encouraging results" can be obtained against such pests as the apple coddling moth the grape berry moth and mealy bug, the corn ear worm.

Promising results have been obtained against the cherry fruit fly, tomato hornworm, tomato flea beetle, the cotton red spider, the tobacco flea beetle, the tobacco hornworm, grass chiggers, and the Japanese beetle.

Dr. Bruce D. Gleissner, research entomologist for Cyanamid, said that the killing properties of the new compound "are long lasting," and that it should save many thoussands of tons of food crops for the farmer.

"It is uniformly more active, and toxic than DDT and any other insecticide being used today" he said.

Dr. J. Carter Swaim's Work

40 Seminaries, Colleges And Universities, With Student Body And Faculty Addressed

At the end of February, 1946, the vice-president of a college was traveling on a bus in the South. It was after midnight and most passengers had their lights out and their seats in the reclining position.

Across the aisle from the college official, however, the light was burning. By its dim radiance a fellow-passenger was diligently comparing two books. One "looked like a Bible"; the othe appeared to be a well-printed book, bound in blue.

"Does this light bother you?" asked the student. "No," said the vice-president. "You appear to be studying the Bible."

"Yes," said the young man. "I am getting acquainted with the recently published Revised Standard Version of the New Testament. I have already memorized the Gospel according to Matthew in the new translation, and it is my aim to commit the whole New Testament to memory."

This was the first time the college official had heard of the Revised Standand Version—it was still less than three weeks old! But he got one at the earliest opportunity and has used it ever since.

*Dr. Swaim is Educational Representative, Revised Standard Version of the New Testament, for the International Council of Religious Education. He is also professor of New Testament literature and exegesis, Western Theologieal Seminary, Pittsburgh, Pennsylvania.

Bible-line Looks Like Nylon-line

In a college town of the Middle West the demand was so great that when a book store announced it would have copies of the new version on sale the following morning, the people queued up, so that perhaps for the first time in history—the Bible-line looked like the nylon-line, the soap-line, and the sugar-line.

A university president in the Chicago area found that in most department stores it was temporarily out of stock; he did succeed, however, in obtaining a copy at Sears, Robuck and Company!

These are but three of countless incidents which, taken together, **make the thrilling story of the welcome** that has been accorded "the most important publication of 1946". It is a story that takes in all parts of English-speaking America: Canada and the United States; North, South, and West—and all classes of people: young and old, the educated and the uneducated, the professional religious worker and the layman.

Read Copy in One Sitting

A retired professor reports that, immediately upon the appearance of the Revised Standard Version, he obtained a copy and read it through at a single sitting.

A minister on the West Coast gave his 93-year-old mother a leather-bound edition for a Christmas present. For years she had studied the Bible out of Dr. Schofield's edition, but wrote that she was increasingly using and loving the Revised Standard Version.

The president of a small denominational college said he had purchased it with some misgivings and for a while used it only for reference and comparison. In a few weeks it had become for him the English New Testament, and now he compares other translations with it.

But its use has not been confined to college presidents, retired professors, and the aged and infirm! In the state of Washington, in a town of 9,000 persons, there is a church which has 600 members. The minister himself sold 125 copies to these members.

One church sent copies to all of its men who were still in military service at the time it was published.

Use it for Group Bible Story

One college student, now studying under the G. I. bill, reported that he became acquainted with it soon after publication; his "buddy" had once studied at the Moody Bible Institute and received one from friends there. The two of them were members of a small group which met regularly for Bible study and prayer. "It was wonderful to have this new version," he said. "It made so many things clear that had not been clear before." Now he is using it professionally, in training for the ministry.

Another college student, planning a 48-hour train ride, took the Revised Standard Version with him and read it through en route, He said it came to him with all the vigor of a new book; it was as if he had never known the New Testament before.

The new translation has, of course, been all but universally adopted in college courses concerned with the Bible as a book of religion.

Not only in institutions of higher learning has it been received with gladness, but also in the church school, by pupils and teachers alike as well as by parents. A junior boy exclaimed, "I read this— I can understand it!" A 12-year-old girl, upon first looking into it, asked, "If that is what the Bible means, why didn't they say it long ago?" An intermediate teacher said, "For the first tome in my life I can read the New Testament with understanding and with unrestricted delight." One mother spoke for many, "I just **love** the Revised Standard Version." Said another, "I never before read more than a chapter or two of the Bible at a time. Now when I read I find myself unable to stop, and I read whole books at a time."

Ministers Use it for Public Worship

Ministers have welcomed it as an aid to worship. On the Sunday when the Revised Standard Version was a year old, a Lutheran elergyman reported that he was using his second copy, having already worn out one. A minister in rural Canada stated that he had used it in the pulpit every Sunday since publication. Many pastors have echoed the one who said he liked it because it made the pulpit reading of the epistles so much easier. He said that the involved sentences structure of earlier official versions always gave him a sense of frustration, He tried hard to read them effectively but always had the sense of failure. The Revised Standard Version enables him to make what he believes is an effective and intelligible public reading of the epistles. An Anglican clergyman said, "I take an interest now in the public reading of the New Testiment."

Many pastors read from it eaeh Sunday and under "Scripture Lesson" on the printed order of worship indicate that the reading is from the Revised Standard Version. One has heard it used in worship at a regional eonvention of the Church of God, in the devotional service at a plenary session of a state council of churches, and at the baccalaureate service of a theological seminary.

A young minister said he regulary takes the Revised Standard Version with him in his pastoral calling. "I am inexperienced," he said, and I wouldn't always know what to talk about. This gives me something which opens up helpful conversation."

Nor is appreciation of the new version confined merely to format or more intelligible English. A saintly woman who has been widowed early in life expressed great relief upon learning the true text of Romans 8:28. The King James Version has it: "We know that all things work togethe. for good to them that love God, to them who are the called according to his purpose." "I have always wanted to believe that," she said, "but I never could see that it was true. All things in my life have not worked together for good. I thought perhaps it was because I didn't fulfill the second condition. I know that I loved God, but decided that I must not be among the 'called according to his purpose." Her faith has been enriched and her theology corrected by the more ancient Greek text recovered in the Revised Standard Version: "We know that in everything God works for good with those who love him, who are ealled according to his purpose."

White Youths Name Colored Boy Most Popular Comrade

Brooklyn, N. Y.— In a demonstration of democracy that opened the eyes of their elders, the young white residents of St. Vincent's Home for Boys at 66 Boerum Place last week honored Horace Lewis, 19, as the outstanding resident of the institution, basing their choice on the three traits of courtesy, co-operation and personality.

What makes the decision of the youths remarkable is the fact that less than 11 per cent of the boys in the institution are colored.

The contest was promoted by the Rev. William M. Casey, white rector of the home, to encourage interest among and promote the morale of the boys in the home. Horace Lewis winner of the contest, is a Western Union Telegraph messenger. He and Donald Stemmer, white, who ran second, received one-year passes to the Fabian Fox Theatre in Brooklyn. The passes were given by none other than the famed Hugh Casey, brilliant relief pitcher of the Brooklyn Dodgers.

One Hundred Agencies

National Conference On Family Life Will Be Held In Nation's Capital May 6th - 7th, 1948

Chicago—The International Council of Religious Education is among 112 national agencies sponsoring the National Conference on Family Life to be in Washington, D. C., next May 6, 7, and 8, Dr. Ray G. Ross, general secretary, has announced.

The conference will bring together representatives of government agencies, professional groups, health, labor, educational, social welfare, religious, and other groups that are interested in the well-being of the American family.

Some of the sessions will be held in the White House.

In addition to the International Council other Protestant agencies sponsoring the eonference include the Race Relations Division of the American Missionary Association, the Commission on Marriage and Home of the Federal Council of the Churches of Christ in America, the Salvation Army, the United Council of Church Women, and national boards of the Y. M. C. A., and the Y. W. C. A.

Committees are now at work preparing reports for the consideration of delegates who will attend the May meetings.

Sir Harold McIntosh's Letter

Pres. of World's Sunday School Association Sends Communication To Leaders

London, England—Dear Friends Since you have an important part in the work of the World's Sunday School Association, I am writing to tell you about the meeting of the Association which took place in Birmingham, England, in August.

We had a great meeting. Present were over 100 delegates from more than 40 countries. It was inspiring to work with them all—Professor Novotny of Czechoslovakia, Dr. Miao of China, Mr. Koshy of India, Mr. Tuilovoni of Fiji, Professor Camargo of Mexico, Mr. Dovlo of Africa, Dean Weigle of the U. S. A., Mr. Rank of Britain, and many others.

The reports we heard from all parts of the world gave us a sense of pressing urgency to expand our service at once. Children and youth need the Gospel of Christ now; tomorrow may be too late.

Plans for big advances were adopted. We could make them with confidence that they were not just idle dreams because we have your support, because Mr. Arthur Rank, Mrs. Heinz, and others in the meeting offered increased financial help, and because of our faith that still more support will be provided when the plans become known throughout Britain, America, Canada, and elsewhere.

You will receive detailed information in the next issue of Christian Education World. If you have any questions, our New York City office, 156 Fifth Avenue, will be glad to answer them.

I want you to know how deeply grateful we all are for your help and how glad I am to be a partner with you in this great work.

Very sincerely yours,
Harold Mackintosh, president

Celebrated Choir to Appear at Assembly Association

New York—Dec. 13. The famous Camp Meetin' Choir, under the direction of J. Garfield Wilson, will appear at the opening of the Lancaster Camp Meeting and Assembly Association's 1948 season in Lancaster, Ohio, on July 4. Definite arrangements have already been set for this appearance due to the busy schedule of concerts which make it difficult to assure a particular date unless arranged well in advance.

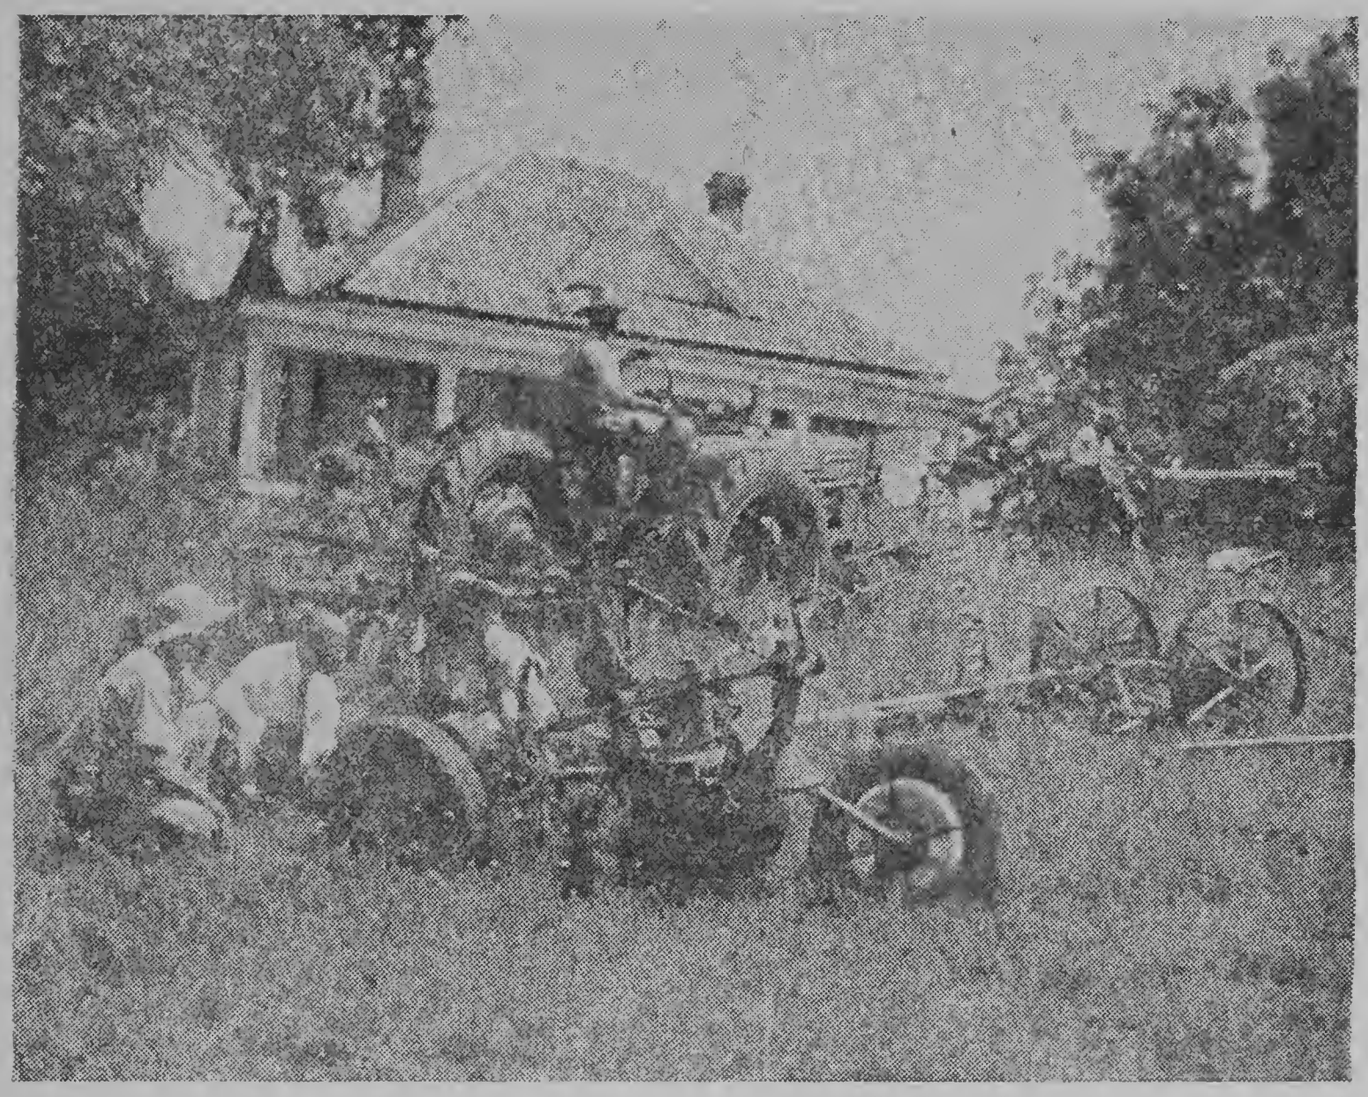
Reverend L. F. Williams, program chairman of the Association, plans an afternoon and evening eoneert by the choir which is considered America's foremost jubilee singers. The Camp Meetin' Choir has been selected because its music must accurately typifies the original eamp meeting singing of the Old South.

In its busy schedule of personal appearances, the Camp Meetin' Choir proves to be a very versatile group in pleasing various tastes. The scheduled performance in Lancaster will be given for a eompletely different type of audience than those in attendance at eoncert halls and auditoriums in principal eities. The radio broadcasts of the Camp Meetin' Choir over the coast-to-coast radio network of the National Broadcasting Company must be presented for appreciation by audiences which vary from the ordinary eoncert or church audience.

A major factor in the versatility of the great choral ensemble is the variety of effects that are produced by the use of a mixed quartet, a female septet, and six soloists within the choir. The Diamond record album of the Camp Meetin' Choir features the variety which make the organization the favorite of church and concert audience alike.

Clothes that need sprinkling will be ready for ironing quicker if you do it with warm water.

Mechanized Farming



Adjusting their farming methods to on-coming mechanization, Jury Clark of Americus, Georgia, and his son, Simpson, have bought two tractors and several attachments. This equipment helps them reduce labor costs in the operation of their 511-acre farm. The Clarks grow cotton, corn, peanuts, pimento peppers, and livestock for market. Their gross income now averages nearly $15,000 annually. Left to right are: State Agent P. H. Stone, County Agent F. M. Staley, Jury Clark, and Simpson Clark. Their modern home is shown in the background.

USDA Photo 8-18-47

Successful Colored Georgia Farmer Grows Pimento Peppers as Sideline Crop

Washington, D. C.—In the cotton and peanut section of southwestern Georgia, colored farmers are now including pimento peppers in their cropping system as a means of broadening their farming program to meet on-coming mechanization and the changing pattern of farming in the South, reports P. H. Stone, State agent in charge of Extension work with colored farmers.

Stone says that with the establishment of a pimento pepper canning plant in Sumter County, hundreds of white and colored farmers have begun raising peppers under contract with the plant.

Typical of the colored farmers who have taken the lead in growing peppers is Jury Clark, 68-year old cotton and peanut farmers of Americus, Georgia. The Clarks, who now average nearly $15,000 annually from their farming operations, own 511 acres. Mr. Clark inherited 200 acres from his parents who bought it in 1865. In recent years, the Clarks inherited 200 acres from his parents who bought it in 1865. In recent years, the Clarks have added 311 acres to their holdings.

While some diffirent farmers in his community were telling themselves that they had better stick to cotton and peanuts and let the peppers alone because they had neither the time nor the know-how to grow them, Mr. Clark and his son, Simpson, were getting information on the new crop from County Agent F. M. Stanley.

Convinced that the peppers were a good sideline crop, the Clarks planted 10 acres of them in addition, of course, to their regular cotton, peanut, and corn crops. Fertilizing and cultivating the crop in accordance with recommendations of their county agent, the Clarks harvested 20 tons of peppers, grossing $1,200.

Simpson Clark, a former student of Morris Brown College, has played an important part in helping his father to develop and expand their farm. Until 1942, the younger Clark was engaged in teaching and in insurance work. But that year his father urged him to come home and help put the farm on a wartime production basis. With Simpson's assistance, the elder Clark doubled his acreage of peanuts and added several head of hogs and beef cattle.

Today, their farming program calls for 60 acres of peanuts, 50 acres of corn, 45 acres of cotton, 100 acres in pasture and woodland, 10 head of dairy cattle, 30 head of hogs, 100 head of poultry, and four head of workstock in addition to their two tractors. The rest of their farmland is rented to four tenants.

Although the Clarks have a busy program, it isn't all work and no play on their farm. In addition to enjoying their comfortable modern home, the Clarks like to swim, fish, and hunt. The elder Clark was considered at one time to be the best bird shot in southwest Georgia. For many years, he used to accompany Ty Cobb on hunting trips.

Also, the Clarks take an active part in community affairs. For 35 years the elder Clark has been chairman of the Associate Agricultural Planning Committee for colored farmers of Sumter County. And Mrs. Clark, a teacher in one of the county schools, is a leader in home demonstration work.

Simpson, who was a four-letter man at Morris Brown, encourages his three children to take part in all games at the local school. Anna, his oldest daughter, won the high-jump at the 4-H rally last year.

State Agent Stone points to the Clarks as a good example of farmers who believe in balanced farming and balanced living.

Peanut Referendum Planned December 9

WASHINGTON. Dec. 1 (AP)—Department of Agriculture officials said today they look for no change in plans to conduct a referendum December 9 to determine whether peanut farmers favor a return to marketing quotas and acreage control to guarantee continuance of the government's price-support program.

The imposition of controls would not be mandatory, even if farmers vote for them, but the department has warned that it will abolish the price-support program unless given

Baby cries when he is hungry, uncomfortable, and when he is in pain. A fretful baby isn't crying for fun. He's trying to tell you something's wrong. Usually it is hunger, advises a pediatrician.

Sow Wheat or Rye for Cover Crop

Thousands of acres of crop land in Tennessee has not been seeded to some type of cover crop for the winter. Although the past fall was not very favorable for the seeding of small grains and winter clovers, there is still time to sow wheat and rye.

Wheat and rye sown now will yield just about as much as it would had it been put out earlier with the exception of protection from erosion. The protection may not be great, but the soil will be better protected with a crop on it.

Seeding of wheat and rye at this time of the year for a cover crop is important, but the primary purpose is to produce and save grain.

Many bushels of grain could be profitably produced on the idle acres and the grain is urgently needed. On the other hand thousands of other bushels of grain will be saved through pasture provided in the early spring.

All Tennessee farmers feel the need for their help in feeding hungry people in other parts of the world, but the humanitarian side is not the only angle to the question. It is good business for a farmer to produce those products which are needed by the consuming public.

There has, probably never been a time when farmers could feel more assured of a market for their product. especially grain, than now.

While no one can look a year into the future and say just what the price of grain and other farm products will be, it is not beyond the rim of sound planning to assume that grain produced from fall seeding this year will demand a profitable price.

Seeds are expensive, fertilizer and equipment scarce, and labor is at an all-time high, yet, those who can should seed those acres which will go through the winter bare.

Even if you find that it is impossible to harvest the crop for grain, the amount of pasture provided will save many more bushels of grain than the amount required to plant the field, and the pasture will no doubt repay the cost.

Think it over! If there is any possible chance to sow those empty fields on your farm, you should do it. If you can't sow 10 acres, sow five or the amount you can.

Don't Mulch Your Plants Too Heavily or Too Soon

By Dr. Floyd Bralliar, Garden Editor, The Nashville Tennessean

Because many gardeners still believe cold weather kills plants, and destroys late fall and winter gardens, mulches are often applied too early, and too deeply.

It is not cold that kills these plants, but the constant freezing and thawing. A heavy frost or a light freeze comes in the night. Just as soon as the sun comes up in the morning, however, if there is nothing to prevent it, these leaves thaw at once. Whereas if they thaw slowly or not at all, no harm will be done.

Don't Mulch Too Soon

Perennial plants and low growing shrubs as well as garden greens and strawberries get through the winter very much better if they are mulched. This mulch should not be put on before about the middle of December. A very light covering will prevent freezing and thawing most of the winter.

In no case should the mulch be deep enough to cover the plants so that they cannot be seen plainly. A light sprinkling of straw is probably the best mulch to apply to salad greens and strawberries. An inch or so of cottonseed hulls ground peanut hulls, wheat chaff or peat moss is best for perennial flowers. Young boxwoods that are set where they are exposed directly to the morning sun, should be mulched well with some one of these materials before really hard freezing weather comes.

Boxwoods Injured

We have seen entire rows of young boxwoods six or eight inches high that came through the winter with the south side of the plant completely dead and the north side uninjured. Had the proper mulch been applied at the right time, the entire plant would have been uninjured.

Some experienced gardeners allow crabgrass and witch grass to grow freely in their gardens in the late fall knowing that they will both die before the first of the year and that they make most excellent natural protection for the plants by which they grow. We do not like this plan, because these weeds are apt to become too thick and do more damage than good.

It may be a little extra work to pick greens in the winter or early spring without getting some of the mulching material mixed in with them. But their extra yield of greens will more than make up for this.

Keep In Good Condition

This is especially beneficial to mulch carrots if they are to be left in the open ground all winter. In nine years out of 10, this is the most profitable way to keep them over winter. If a fairly heavy mulch is placed on the garden, and the tops allowed to stick out a little above the mulch, they will usually keep in fairly good condition nearly all winter.

Some plants die down to the ground every fall and come up again next spring. It is usually best not to mulch such plants at all in the South, though if you do mulch them, you should put the mulch on lightly. For if too much is used, it is almost sure to hold moisture enough to cause the plant to rot. For plants whose tops disappear entirely in winter, a mulch of leaves or straw will do the trick. Actually when such plants are well established they require no mulch. It is only when they are newly planted in well-spaded soil that heaving action is likely to do damage. In such cases, a mulch is advisable.

Straw For Strawberries

We especially urge the use of straw in mulching strawberries and it is not to be put on until about the middle of January. We do not put straw on the strawberry bed for protection against the cold at all, but in order to encourage the flower stem to grow up through it and so get the berries away from the soil. Straw is sure to be clean and to stay clean. And it not only keeps the berries clean, but it prevents an evaporation of moisture from the soil so that the bed does not suffer from lack of rain during fruiting time.

In the early spring a mulching material should be raked off of most plants and worked into the soil.

It was no shallow optimist, but so wise and thoughtful a man as Montaigne who wrote, "There is no greater evidence of wisdom than a continual cheerfulness." No one ever crossed the street to get rid of meeting our old friends the Brothers Cheeryble. Even four-footed animals know the difference between Mr. Growl-at-Everything and his neighbor, Mr. See-the-Good.

Pimento Peppers Replace Cotton

Jury Clark of Americus, Georgia, and his son, Simpson, are shown loading up their truck with pimento peppers grown on acres formerly devoted to cotton. Off 10 acres, the Clarks harvested 20 tons of peppers and sold them to a nearby canning plant for $1,200. Growing peppers and other sideline crops is in keeping with the balanced farming program urgently recommended by Extension Service of the U. S. Department of Agriculture to help cotton farmers adjust their **cropping system to a new pattern of farming in the South.**

White Hybrid Corns Rank First in Tennessee Yield

Tennessee white hybrid corns, Dixie 17 and Tennessee 10, continue to rank first in yield, it was reported yesterday at the annual convention of the Tennessee Crop Improvement association.

The recommendations were made by O. H. Long, agronomist at the University of Tennessee experiment station, Knoxville, speaking at the afternoon session in the Andrew Jackson hotel.

He added that experiments showed certain yellow hybrids to give relatively high yields, but not as high as the white. He named yellow Funk G 711, Dixie 44 and Kentueky 102, the latter reeommended for early erops.

Sam McMurray, agronomist, who with Long heads the crop variety testing section of the university, reported that the following varieties in small grains proved the highest producers:

Forked Deer oats, Jackson No. 1 barley, and Tennessee 612 (Fulcaster) and Thorne wheat.

About 325 members of the association produced 315,000 bushels of certified crop seed worth $2,000,000 during the past production season. W. H. Wellhausen, chairman of the seed certifieation committee, reported.

He said the group has increased production of certified soybean seed from eight and a half bushels per acre to 18 bushels, and corn yield increased 35 per cent in 10 years. In many cases corn yield from white hybrid certified seed and good farming methods has reached 150 bushels per acre, he said.

A general discussion of corn diseases with relation to the association's breeding program will be held today. L. M. Josephson, corn breeder with the Kentucky Agricultural Experiment station, will talk.

Mechanical detasseling will be discussed by Morgan Stovall of Huntland. F. D. Richey of the Tennessee agricultural station at Knoxville has charge of the program.

Henry W. Foster

(Continued from page 1)

addition, he was selling nearly 80 dozen eggs weekly.

Totaling up his annual figures, Foster's records show that he sold approximately 4,00 dozen eggs and 15,000 dressed broilers to local hotels and cafes last year. When asked how much he netted, he replied, "About $8.000 something over $7,000 from broilers after the cost of baby chicks and feed is deducted, and the rest from eggs.

Rapidly, Foster's farm is becoming a show-place for farmers from miles around who are brought there by their County Extension agents so that they may see his farm. As a result of these visits, the agents expect more farmers, who have been depending entirely on cotton, to begin raising poultry as a sideline cash crop.

Mrs. Foster, who is a home management supervisor for the Farmers Home Administration, also brings home with her some of the farm people with whom she works so that they may study how to incorporate poultry raising into their farming program.

Although Poultryman Foster is carrying on a good size operation, he does most of the work himself, except during the summer when his two teen-age children a girl and a boy are home from boarding school. However, by purchasing a mechanical feather picker, he has reduced considerably the time required for dressing his broilers for market.

And Foster is learning poultry raising from the ground up, too. He is finding out how to combat most diseases to which chickens are susceptible, how to develop good breeds, and what feeds are best for layers, and which combinations are best for broilers. Bringing his classroom experimental approach to poultry farming, he is already trying out his own feed formulas on a small part of his flock.

When he has worked out a satisfactory feed formula, he plans to enlarge his farm which now contains only 16 acres. Also, he plans to expand his poultry house faeilities and up his broiler production to 500 per week. The poultryman believes that he can sell locally all the broilers he can produce. Within five years, he envisions an annual income of $15,000 from his poultry enterprise.

Whip of Progress

Most of us think that the "boom-town" days of the oil industry ended many years ago, and that the industry can now take it easy and supply the public's needs with its present facilities.

The truth is that oil is engaged in a tremendous and dramatic race to bring output up to the enormous civilian demand that came after the war.

The geologists and wild-catters are searching for new oil reserves in every corner of this country—and in a long list of foreign countries as well. As rapidly as the necessary materials can be bought, they are sinking new wells and enlarging their refineries. The laboratory technicians are seeking new methods of getting more oil products out of each barrel of crude, and for producing oil from sourees which so far have been untouched. Never in history was so much oil needed as now—and never in history was so much knowledge, money and sheer drive given to producing it.

Competion within the industry is extremely keen, both in obtaining supplies of crude and in seeking public favor with ready-used oil products. That in itself is the best guarantee that the demand will be met with a minimum of shortages and that the price changed will be as low as current costs allow. Oil isn't standing still. The whip of progress is keeping it on the run.

Farms of Nonwhite

(Continued from page 1)

aged farms, and a decrease of 281 in the number of tenant farms.

The 1945 total of 10,435 farms, as compared with 1910—the year which marks the high point for both farm ownership and tenancy among nonwhite farm operators—represents a decrease of 4,286 (29.1 percent) in the State's total number of nonwhite-operated farms. Nearly four-fifths (79.3 percent) of this decrease was accounted for by tenant farms. The absolute decrease in the number of tenant farms in the 35 years 1910 to 1945, was 3,400, or somewhat more than four times as large as the loss in owner-operated farms. (831).

Marked changes in land in farms, cropland harvested. and value of land and buildings accompanied the changes in number of farms between 1940 and 1945. Figures for the three principal tenure classes show that there was a net gain of 57,006 acres (12.5 percent) in the total acreage of farms of nonwhite farm operators. Land in owner-operated farms increased from 255,322 acres to 322,579 acres, or 26.3 percent. On the other hand, land in tenant and managed farms declined from 198,-917 acres to 188,666 acres (5.2 percent).

The 234,241 acres of cropland harvested on nonwhite-operated farms in 1944 represented an increase of 21,994 acres, or 10.4 percent, over the number of acres of cropland harvested in 1939. During the period, 1939 to 1944, a slight decrease of 2,215 acres occurred in the number of acres of land harvested on tenant farms. This decrease, however, was accompanied by an increase of 24,209 acres (22.7 percent) in the land harvested on owner-operated and managed farms.

In value, land and buildings of nonwhite-operated farms rose from $10,590,496 in 1940 to $16,428,951 in 1945, for a 5-year gain of $5,838,455 (55.1 percent). The largest part of the total increase—$3,992,091, or 68.4 percent—was for owner-operated farms, and the next largest part—$1,106,769, or 19.0 percent—was for tenant farms.

Eech of the 67 counties in the State of Florida, except Charlotte, Collier, Franklin, and St. Lucie, had one or more nonwhite-operated farms in 1945; however, the 6 counties of Alachua, Gadsden, Jackson, Jefferson, Leon, and Marion accounted for 52.7 percent of the total number of nonwhite-operated farms, 53.4 percent of the nonwhite owner-operated farms, 52.1 percent of the nonwhite tenant farms, 57.6 percent of the land in all nonwhite-operated farms, 65.4 percent of the cropland harvested, and 48.9 percent of the value of land and buildings.

Table 1 per cents statistics from the 1945 and 1940 Censuses of Agrieulture which show acreage, value of land and buildings, and cropland harvested, for farms of nonwhite farm operators, by tenure, for the State of Florida.

The term "nonwhite" includes Negroes, Indians, Chinese, Japanese, and other nonwhite races, but nearly all of the nonwhite farm operators in the State of Florida are of the Negro race.

A "farm operator," according to the census definition, is a person we operates a farm, either performing the labor himself or directly supervising it. Full owners own all of the land they operate. Part owners own a part and rent from others the rest of the land they operate. Managers operate farms for others and receive wages or salaries for their services. Persons acting merely as caretakers or hired laborers are not classified as managers. Tenant operators hire or rent land only. Croppers are tenants who pay a share only of either crop or livestock production of both and for whom their landlord furnishes all the work animals or tractor power.

Three Johnston

(Continued From Page 1)

cent moisture by the agent and Wilson County Agent C. W. Foster, were 108.8 bushels for Archibald, 105.6 bushels for Mrs. Sanders and 103.2 for McClamb.

Seven additional farmers and eight 4-H members became associate members of the 100 bushel club for producing more than seventy-five bushels per acre. The adults listed with their average yield per acre are: J. W. Mitchener of Smithfield, Route 1 98.8 bushels; Rev. J. T. Hocutt of Middlesex, Route 1, 95.2; George Adams of Middlesex, Route 1, 94.8; Shepherd Sanders of Clayton, Route 2, 91.8; William Barnes of Middlesex, Route 1, 91.6; Henry Delaine of Clayton, Route 1, 81.3, and Leo Warren of Newton Grove, Route 1, 77.6.

Four-H associate members are: Edythe Eatman of Micro, 99.2; Raymond Mitchener of Smithfield, Route 1, 90.7; Henry Revells of Selman, Route 1, 89.6; John Everette of Princeton, Route 1, 85.3; Clifton Mitchener of Smithfield, Route 1, 84.2; Ernest Revells of Selma, Route 1, 79.7; Carrie Weathersby of Willow Springs, Route 1 78.5 and Ben Sanders of Four Oaks, 76.9.

The nine farmers produced 1,940.8 bushels of hybrid N. C. 1111, N. C. 26 and Tenn. 5109 on twenty one acres of land with an average of 92.4 bushes per acre, at a cost of $403.63 (less labor), averaging $19.20 per acre or 20.7 cents per bushel. This corn was planted in three and one-half feet rows, 16 inches in the drill with an average of 450 pounds of fertilizer (4-10-6) and 375 pounds of nitrate of soda or its equivalent.

Eleven 4-H members planted N. C. 111 and N. C. 26 and produced 928.2 bushels on eleven acres, averaging 84.3 bushels per acre, at a cost of $204.21 (less labor). The average cost per acre was $18.56 or twenty-two cents per bushel. The club members followed the same recommendations as the adult farmers.

This program was started in 1944 when a group of Negro farmers met with the County Agent to map out a general farm program for Johnston County with emphasis on corn production. "You are considered a fairly good farmer when you have corn in the crib, meat in the smokehouse and wood on the woodpile" was the thought expressed by the agent at that time. The following recommendations for increased corn production was given: plant soil building crop in the fall; prepare good seed bed; plant recommended adapted hybrids in three and one-half feet rows, 16 inches in the drill, and use 300 to 600 pounds of a good fertilizer per acre (6-8-6- or 4-10-6) and 300 to 500 pounds of nitrate of soda or its equivalent; use shallow cultivation, just enough to contral the weeds and grass; discontinue plowing corn when it is two and one half feet tall.

NOTE: A picture was made of the producers who made 100 bushels on one acre by a representation of the SMITHFIELD HERALD, Smithfield, N. C.

L. R. Johnson, Negro County Agent

That famous Jonathan Swift widely known in the world of English literature. who died just two centuries ago, once wrote, "I hate and detest that animal called 'man,' although I dearly love John, Peter and Thomas." There are people today who love animals. Their animals. Who love children. Their children. Buo your animals and mine? Your children and mine? That's another matter.

Teacher—"Freddie, your essay on 'My Mother' is exactly the same as your brother's, word for word."

Freddie—"Yes, sir. We have the same mother."

New Look for Lowly Potato

(Continued from page 1)

depressions, we stop eating more costly meats and switch to the potato.

No wonder the government is turning to research.

The bulletin hopefully predicts that the results "should enhance the tastiness and appearance of the finally prepared product."

So, chemists, to your test tubes! Home economists, to your pots and pans!

Eagerly we await the next milestone in the life of the humble potato.

May its look be new and its taste be enhanced.

Byrd's Nest

(Continued from page 1)

shoes take their places. The writer dares to step farther out on the limb and say, "We find such men in our local fields, our district, State and National Bodies." We must admit that the ark was good, but Noah couldn't get very far as long as he hung around it, and kept his off-spring in its vicinity. Surely the writer admits that many leaders have been good, perhaps the best we could get for the crossing of the streams and mud-pits, but we shall never ascend the heights as long as we hang around the bridges. The writer does not expect all men to agree with him, and consequently weleomes any criticisms and comments.

The only way we can adopt new things, and enter into new ventures, is by getting away from the old. Christ in commending the wisdom of wine-makers, said, "Men do not put new wine in old bottles," etc., and then eontinued to explain that such practices of putting new wine in old bottles might bring a loss of both the old bottle and the new wine. These are not uncommon incidents of life, for we know that Jesus meant that the old bottle was one which had made its complete expansion, and since there was no more, the placing of new wine which would make some expansion, would mean that something would have to break. In life we know that it is a matter of impossibility to injeet progressive thought into the minds of some people. We must eonclude that these people have reached the limits of their elasticity, thus making it impossible for further expanson into the realms of mental and organic progress. The limited mind is full of objections, and stops. It feels that because it cannot do certain things and because it cannot conceive of certain things, that they cannot be done. The flexible mind is filled with consideration, tests, trials, and experiments. Two such types of minds cannot ever accord, and when found in the same organization will often clash because of their abilities and inabilities. When a church, an association, a State or National Convention has a leader whose minds has reached its zenith, the group can never move into the fields of greater progress until it has moved away from a leadership which affords no mental expansion.

Here and There

Gentleness and cheerfulness—these come before all morality; they are the perfect duties. And it is the trouble with moral men that they have neither one nor other. If your morals make you deary. depend upon it, they are wrong. I do not say "give them up," for they may be all you have; but conceal them like a vice, lest they should spoil the lives of better and simpler people.

—R. L. Stevenson

Economic Highlights

Happenings That Affect the Dinner Pails, Dividend Checks and Tax Bills of Every Individual National and International Problems Inseparable from Local Welfare

In its issue of September 6, the Saturady Evening Post printed an article that an editorial note characterized as "prehaps the most desperately important message" it will publish this year. Entitled "Are We Ready for a Push-Button War?" and written by Joseph and Stewart Alsop, it deals with the mueh publicized and little understood topic of guided missiles.

The principle of guided-missile warfare is simple enough. A button on a switchboard will be pushed, and a few minutes later a rain of missiles of incredible destructiveness will descend upon enemy targets. There will be no warning. The missiles will travel infinitely faster than sound, and so will arrive in complete silence. Factories, bridges, power plants, railroads, communieations, even whole cities will be instantly destroyed—along with thousands and prehaps millions of people. The enemy's capacity to make war will cease to exist, and the conflict will be decided in a matter of hours.

That is the consept. We already have, in the atomic bomb and other weapons, the charges these missiles will carry. The problem is to produce a suitable missile. It is, in other words, purely a problem of developing a vehicle.

The Alsops began their remakrable article with two statements made to them by a researcher in the field. He said: "The first thing to understand about guided missils is that there aren't any. But the second thing to understand about guided missiles is that there will be."

When will practical missiles be ready to take to the air—and to the spaces beyond? The Alsops offer an answer to that based on extensive interrogation of the scientists. It is expected that an antiaircraft missile which will be guided by wonderfully perfected radar and whose purpose will be to destroy invading planes, will be ready in two to five years. The intermediate strategic missile, which will be fired from planes, ships or forward bases, may be praetical in six to ten years. Finally, missiles of the ultimate destructive power, with ranges up to 5,000 miles, which will make possible direct intercontinental warfare, may appear in ten to eighteen years.

Readers may wonder why no mention has been made here of the German V-2 missile which eaused tremendous destruction in England in the last stages of the war. The reason is that researchers regard it as having been primitive in the extreme, even though it was a marvel of mechanieal ingenuity and daring. Its range was short, and it could not be accurately guided. The V-2, by comparison with the missiles now on the drawing boards, will be like a muzzle loading blunderbuss opposed to a naval rifle.

The technical problems connected with the development of missiles litterally stagger the lay mind. Even the Alsops, in a long article, have room only to touch some of the high spots. Ordinary metals would burst into flame at speeds far below those projected. Launching a missile which will proceed in seconds from the ground to heights of 60,000 feet or more and there start for a target, is an incredibly complex operation. Desirable fuels—capable of giving both sufficient thrust and range—are still in the laboratory phase. And, dwarfing all other difficulties, is that of guiding the missile with bulit-like aceuracy to a target thousands of miles away.

As an example of the Jules Vern-like conceptions entering into the guidance problem, the Alsops cite one projected method whereby what amounts to a navigating bridge will be built into a missile. As the missile proceeds, instruments will take position from the stars, and constantly eommunicate orders to other instruments which in turn will operate on controls. The missile will thus be brought to its target precisely as a ship is brought into a port.

Achieving great distance is another terrific problem. One scientist believes that may be ultimately solved by joining two or more missiles together. One, for instance, would furnish the thrust for taking the missile off the ground and into the atmosphere where, at a given point, the second missile carrying the warhead would be "kicked" off, its engine would automatically start, its guidance would take over, and it would proceed to the target.

What will be the cost of all this? No one really knows. Missiles will cost $6,000,000 or $7,000,000 each to build, once we—or another nation—learn how to build them. A suitable wind tunnel for testing will cost more than $1,000,000,000, not counting maintenance. The total cost will obviously be incredibly great—greater perhaps than the cost of developing and making the atomic bomb. The science of utter destruction becomes more expensive.

Finally, must we give our money and our scientific energies to perfeeting and manufacturing missiles? The Alsops feel that we must, in the name of self-preservation. It is known that the Russians are working on them at fever pitch, precisely as they are working with the problems of atomic power. Beyond the Urals, Soviet scientists are getting ready for another war. American scientists, with all the resources they can command, are doing exactly the same thing.

Milk Production 15 Per Cent Below Normal, Survey Shows

Milk produced by dairymen and sold to distributors during the past 30 days has been about 15 per cent below normal, a survey conducted by THE BANNER revealed today.

However, retail plants said that they noted an increase in the supply from the producers this past week. The increase is said to be about 5 per cent, still 10 per cent under the normal production level. Credit for the increase was given to better feeding.

While milk production in Tennessee is off about 10 per cent this year, it is estimated that in the United States as a whole, the production is some two per cent below that of last year.

High feed cost has been blamed for the decrease. While the cows may have had enough to eat, it may not have been of the proper feeds to aid in milk production, plant officials agreed.

The five per cent increase this past week is said to be due to an increase in the concentrates fed in the barns at milking time. Then too, water is available in sufficient quantities to meet the dairyman's needs.

At the beginning of the drought earlier this fall dairymen noted a 10 per cent decrease in their milk production. This was due partially to insufficient feed and water, and in the main to dried up pastures.

Pa Allus' Sez

By Fayola Payne

"New chemicals bring many changes in farming," a fellow said to me. Some new methods and materials help to get better results I know. Sprays help to control flies, worms, and all kinds of insects, but the best chemical in the world won't do no good unless a fellow takes to paying regular attention to when and where its needed. It ain't like molasses and sulphur once 'er year to fix a fellow up fer a long spell. You have to watch the stalls, and sheds, and roosts, come every change of the weather and don't put off spraying 'til tomorrow.

Corn, Peanuts Grain

Grain Sorghum may be harvested by eombining, cutting heads by hand, cutting for fodder, or by grazing with cows and hogs.

Mastitis Control Program Progressing 'Full Swing', State Director Declares

The State Department of Agriculture program for the control, prevention and elimination of mastitis is progressing "full swing" among the dairy herds of Tennessee. Dr. A. A. McMurray, director, said today.

For the first time in the history of Tennessee, or perhaps the entire United States, all dairymen in the state who request this service of the Department of Agriculture can secure it free of charge from a staff of trained personnel.

The program, which was started in Tennessee a little more than two years ago under the direction of Dr. McMurray, has gained national recognition during the past year. Dr. McMurray is a pioneer in the field of controlling mastitis, one of the most expensive diseases for the dairymen.

It had gained much headway in Tennessee by mid-summer of 1945. The control program was initiated at that time. Since then many large dairymen have adopted it and have found that the disease not only can be controlled, but can be prevented in many instances.

The program was first proven in 15 demonstration herds in various sections of the state. The same information and assistance given the owners of the demonstration herds is now being given to any dairyman in the state desiring it.

"As dairymen over the state become more conscious of the losses they are suffering from this disease, more will adopt the program and we will continue to increase our personnel to meet those demands," Dr. MeMurray said.

The entire milk industry appreciates the importance of this program to the point that the distributors as well as the manufacturer of dairy products are assisting in eonducting the program among their individual producers.

The program as recommended by Dr. McMurray is based principally on care and management with sanitation playing a major role.

"Sanitation is essential in eombatting any disease in the dairy herd. All filth should be so disposed that the udder cannot become contaminated. Mastitis organisms are present in and around the barn in mud, stagnated pools, etc., always ready to infest an injured udder. It is therefore essential that sanitary conditions prevail if a successful preventive and control program is to be inforced," Dr. McMurray said.

The department is offering assistance in any manner the producers request it. They will visit the individual herds and assist the dairymen in finding which of his animals have mastitis and help him to work out a program which will prevent the further spread of the disease and eliminate to a large degree the losses suffered through reduced milk production.

"We are convinced the program is workable and it is for all Tennessee dairymen," Dr. McMurray said. "However, it will require the eooperation of all dairymen if they expect to eliminate the disease," he concluded.

Butter Pea Something New! Try It Out in Next Garden

By Dr. Floyd Bralliar
Garden Editor
The Nashville Tennessean

No matter how long one ages in gardening, he is sure to find something new to him every year, and usually these new items are well worth growing.

This year in one of the county first class gardens I was introduced to the butter pea, I had never heard of this before so I immediately arranged for seed to give it a trial next year. The seeds were red, and looked like a plump fat butter bean. Not quite as wide as Henderson's bush lima, but at least twice as thiek.

Of course, I couldn't be satisfied without learning more about this butter pea, as I saw nothing but ripe seed. And without seeing the plant at all, I inquired around until I found that the original seed came from Atlanta, Ga.

I insisted that this was a butter bean rather than a butter pea but I couldn't get any definite description of the plant so I am not sure of it.

A few days ago I was in Atlanta, and called on H. C. Hastings, to find out about this butter pea. Hastings, by the way, has been in the mail order seed business longer than any other living seedman—more than 57 years. When I broached the matter of butter pea to him, he said it was sent to him by some people in South Carolina some 10 or 12 years ago, under the name of butter pea.

The beans are packed tightly in the pod and are narrow and fat. They somewhat resemble crowder cow peas. Someone noticed this resemblance and named them butter peas, just as lima beans are known as butter beans. The name spread, became popular, and became the local name for this bean.

Hastings said that the stock was more or less mixed when he received it. Most of the seeds were white but some of them were pure red—almost a buckeye red. By careful selection, the company developed three, distinct strains of butter peas. The white bush variety, the white pole variety, and the red pole variety. They are not quite as early as Henderson's bush lima but they are more productive and have the virtue of being continuous bearers, beginning to produce beans almost as early as Henderson's bush lima and continuing to yield until killed by frost.

The chief value, however is in the superior flavor. They claim to have a rich buttery flavor, and are better than any other lima bean that yields well in the south. Hot weather does not stop their setting beans. Most people with whom I have talked prefer the red variety to the white. I suggest that many of our readers give this bean a tryout in next year's garden. I call this a bean for it really is a bean though you buy the seed as butter peas.

Let 'Er Burn!

The attitude of the American people toward fire seems to be, "Let 'er burn!"

That is the only way our record fire waste can be explained. This year we will burn some $600,000,000 worth of property and 10,000 or more lives will be lost. And, if the rate of increase continues, we will reach the billion-a-year point in a comparatively short time.

This record is a national disgrace. Fire waste involves far more than the destruction of dollar values. It means the loss of irreplaceable resources—the loss of jobs—the loss of taxable assets—the loss of business opportunity—the loss of food, machinery and ther supplies which the whole world needs.

Private and governmental authorities are now carrying on the most aggressive campaign to conquer destructive fire in history. It began last May, when President Truman called a national fire prevention conference in Washington. An all-inclusive program was laid down then, and it is being followed. But any program is doomed to failure unless it is given a full measure of public support. The experts can't lead you around by the hand and force you to make your property safe. They can only advise and instruct. Then, it is up to you.

Poultry Purchase Program to Help in Saving Grain

The United States Department of Agriculture has announced a purchase program to help producers speed up culling of hens, and, at the same time conserve poultry meat supplies for later use by consumers.

By assuring farmers an outlet for their fowl, the program will aid the poultry industry in carrying out its efforts to conserve grain.

Until further notice, the announcement says, the department will purchase only hens which are culled from the Nation's laying flocks in an effort to reduce their numbers by 136,000,000 by January 1, from the numbers on hand Oct. 1 this year.

The accelerated rate of selection, as compared with a "normal" rate, could save approximately 30,000,000 bushels of grain during the rest of the feeding year. Selecting and selling at a normal rate would reduce the national laying flock to a total of 440,000,000 birds on January 1. The increased rate would reduce these numbers to about 400,000,000.

Poor Cutting, Waste, Insects Worse than Fire on Forests

By Aelxander R. George

Washington — (AP) What's the biggest destroyer of American forests?

Fire?

No.

It's the most spectacular, but it ranks only fourth among the major enemies of our dwindling national woodpile.

No. 1 long-range menace, according to U. S. forest service records, is the harvesting of timber without providing sound methods for its replacement. Service officials say reasonably good management of the forests would double the tree growth.

Second biggest drain is waste in logging and manufacturing. Only 43 per cent by weight of the wood we cut or destroy in logging or import appears in products other than fuel. Some 35 per cent is not used at all. The remaining 22 per cent is used as fuel, much of it inefficiently.

Third biggest drain is damage by insects and diseases. The loss from these is estimated at 622,000,000 cubic feet a year, compared with an average annual fire destruction of 460,000,000 cubic feet.

Every year the cut and kill of saw timber in the United States is one and a half times as large as the growth. The current annual growth of saw timber is 35,301,000,000 board feet. The "drain" is 53,893,000,000 board feet.

The current pressure for increasing output of forest products needed for housing, paper manufacture and other uses aggravates the problem.

The forest service says one way to get "a reasonable commodity cut from the forest" is to take as much of the harvest as practicable in the form of poor and partially defective trees and in trees of the less desirable species. This would leave more of the straight and more desirable trees for future growth toward high-quality products.

Weeding, improved cutting, thinning and pruning in young stands greatly increase the potential value of later harvests. It is estimated that about 85,000,000 acres of the younger stands might well be pruned, weeded, or thinned.

A survey by the forest service shows that 71 per cent of the owners of small woodlands cut their trees in such a way that the cut-over land has no timber value left or almost none. Only 4 per cent of the small owners cut wisely, leaving their forests able not only to grow but to improve. Twenty-five per cent of the small cutting rates "fair."

Reforestation under the best conditions is slow business. It is estimated that 75,000,000 acres of denuded and poorly-stocked forest land will have to be planted to trees if it is to grow timber within the lifetime of present-day children. The total forest acreage planted since 1926 totals 6,483,000 acres.

Cake baked in a square pan, espeeially if the pan is enamel-ware is likely to become too brown at the corners, reports the Department of Agriculture.

A Lump of Coal

Ask the ordinary eitizen to describe a lump of coal, and he'll tell you that it's a black, heavy, rather dirty substance whose reason for being is to provide heat for homes and energy for industry.

These are vitally important funetions—but it is now being found that coal is a great deal more versatile than that. In the near future coal will not only be a solid fuel, but will be a source of gasoline and other liquid and gas fuels, and the raw material base ef innumerable chemical products. And, luckily, our known reserves of coal are virtually limitless.

According to an authoritative survey, based on technical information supplied by a large number of governmental and industrial organizations, "Complete conversion of coal to liquid and gas fuels and to chemical means the establishment of whole new major industries." To be practical, the plants must be of great size. Each will cost in the neighborhood of $100,000,000, and will employ 2,000 men directly and 4,000 indirectly. A pilot plant is now under construction and, if it lives up to expectations, the work will go ahead as rapidly as conditions permit.

There, in brief, is the transformation that a commonplace lump of black coal is now undergoing. Back of it lies. decades of exacting research and experiment. And free enterprise is turning theories into practice.

Milk Consumption Skyrockets in U. S.

More than 60,000,000 quarts of fresh milk and cream are now being used daily by U. S. consumeers, a larger amount than at any time before the war, according to new figures developed by the Mills Industry Foundation.

Per capita consumption is 16 per cent above the pre-war level and milk and dairy produets are the most widely used foods, comprising more than 25 per cent of all foods consumed by the average American.

Best utilization of feed requires further emphasis upon milk production, according to the Foundation, because milk returns larger amounts of calories, protein, calcium, vitamin A and riboflavin per bushel of feed used in production than does any livestock or other livestock product.

There is no waste in milk as every drop can be used. A quart approximately these percentages of daily nutritive requirements of an average man: ealcium 100 per cent plus, riboflavin 82 per cent, phosphorus 67 per cent, protein 49 per cent, vitamin A 30 per eent, thiamin, 22 per cent, ealories 22 per cent, vitamin C 19 per eent, niaein 6 per cent, iron 3 per eent.

Milk is a better food to buy than ever before, the Foundation said and government eost of living studies show that since pre-war days the advanee in the price of fluid milk is considerably smaller than that for "all foods." New distribution methods are eredited with keeping priees lower than would otherwise be possible, providing unusually high food value at relatively low cost.

The American system of milk supply and distribution, acknowledged to be the best in the world, is a model for all nations. The Foundation reports receiving more requests than ever from foreign countries for data on the U. S. milk distribution plan.

Today, 57 billion quarts of milk are produced annually by 26,000,000 cows on three quarters of the nation's 6,000,000 farms. Half of this supply is used as milk and cream; the other half for butter, cheese, ice eream and a myriad of produets ranging from dry milk to plastics, paints, textiles and pharmaceuticals.

Foundation estimates show that one out of every 15 U. S. families depends on milk for a livelihood and that milk is the largest single source of farm eash income. Milk represents 15 per eent of all farm eash ineome and is larger than cattle or hogs; two and a half times wheat or cotton; one and a half times poultry and eggs; four times tobaceo. Farm eash milk income is higher now than ever before in history and is still rising.

Oklahoma Colored Farmer Grosses $3,000 off 20 Acres

In recognition of Cicero Abernathy's progressive farm practices which may offer a way out for many small farmers in a mechanized agricultural economy Soil Conservation, a U. S. Department of Agriculture publication, devotes the lead article of its November issue to his 20-acre farm.

How Mr. Abernathy, an Oklahoma colored farmer who lives near Okay, grossed $3,000 this year off 20 acres is a story of a far-sighted soil conserving farmer shifting from one-crop cotton farming on a few acres to intensified truck crop farming, supplemented by grass seed production and a small pig crop.

Soon after Abernathy bought his 20-acre farm 18 years ago, he found out that he could not make an adequate living for his family growing cotton and corn. So, he shifted over to truch farming: Strawberries watermelons, cantalops, tomatoes, okra, peas, peppers, spinach, and other vegetables. He sold his strawberries wholesale and retailed his other vegetables off his truch from door-to-door in Muskogee. Immediately he began making a better living, but he noticed that gullies that began washing when he grew cotton were getting deeper.

Realizing that he couldn't continue making a good living if his land kept washing away, Abernathy decided to call on the supervisor of his soil conservation district and get some help. He went to the Verdi-Grand Soil Conservation District and applied for assistance.

A Soil Conservation Service technician, working with the district came out to his farm and helped him work out measures to control erosion and build up the fertility of his land.

Terraces were rebuilt and enlarged and grass was sodded at the outlets. Fertility of his land was restored by hauling corn cobs, eotton burrs, manure, straw, and other wastes out into his field and spreading it over the soil. "Every time I take a load of truch to town, I always bring something back for my land," Abernathy says.

This year he sold $830 worth of strawberries off an acre and a half, $1,050 worth of vegetables in town, $600 worth of weeping lovegrass seed, and $500 worth of hogs. Altogether, he sold $3,000 worth of products, more than twice what he grossed before he improved his land.

When his crops are in, Farmer Abernathy makes extra money hauling cotton for his neighbors. He hauls right through November, except for the time he takes out o plant clover crops on his eultavated acres.

With the money saved from truck farming, Abernathy has purehased 60 acres. He plans to branch out into beef eattle raising. Already he has some brood stock on hand.

Yellow Hybrid Corn Leads Production in Lewis County

Hohenwald, Tenn., Dec. 1—(Spl.)—In a corn-variety test eonduеted on the farm of Luther Baxter of the Buffalo Valley eommunity this year, Dixie 44, a yellow hybrid, led in produetion, yielding 50.6 bushels per acre, while Dixie 17, a new white hybrid, was a close second with a yield of 47.4 bushels, aceording to County Agent Louis Sawyer.

The third variety under test in this field was another hybrid. Indiana 901, which produced 32 bushels per acre.

These one-acre plots were grown on similar soils, planted the same day, and were given like a eultural praetiees. The prolonged summer drouth reduced the yields considerably, Sawyer pointed out. Sinee moisture tests were not readily available, 78 pounds of ear corn in the husk was eounted per bushel.

Strange Money

In various parts of the world there have been many mediums of exchange, that is, very strange things have been used for money. It is interesting to note that insects, birds, fish, and animals—both wild and domesticated—have been highly respected forms of currency.

We are even indebted to animals for the very name of "money," inasmuch as the Latin word for money, pecunia, is derived from pecus, meaning "cattle."

Sea shells were one of the earliest forms of money, and the small shell known as the "cowrie" is still used in some parts of India.

The cow was the monetary unit among the Gauls, Germans, Angles and Saxons. As late as the fourth century. Romans paid their fines and taxes in cattle and sheep.

In Ireland, pigs and sheep known as "living money" were the equivalent of currency.

Red feathers of a small bird known as the Scarlet Honey Eater are used as money by the natives of the Solomon Islands. However, the "money" consists of only feathers that are shed by the living bird, and the birds are protected, else the money supply would soon become exhausted.

In Tartary, the Tibetans churn yak milk into butter, mold it into cubes, and use it as money.

Aecording to the archives of Babylon, Assyria, Persia, India, Egypt, Greece, and Rome, bees were once quite important as "money producers." All taxes and tributes were levied in the form of payments of honey and wax.

Among natives of West Africa, the elephant's tail is held in highest esteem as currency, having been used as far back as 1600. While in other parts of Africa ivory tusks are used, and natives in the Fijis use whale teeth for currency.

In the early days, the New England Puritans used many things, including codfish, as legal tender.

—Jewell Casey

Medical Expenditures of Colored Farm Families Only Half That of Whites in Rural Southland

A study of changes in medical expenditures during the war reveals that Negro farm families spent only about half as much for medical care in 1945 as did white farm families in the South.

A recent preliminary release of the study, which was made by the Bureau of Human Nutrition and Home Economics and the Bureau of Agricultural Economics, shows that colored farm families had an expenditure of only $40—mainly for physicians and medical supplies—in 1945, as compared with an expenditure of $81 per white farm family in the South.

Both white and colored farm families lagged behind farm families of the North who spent $101 for medical care in 1945. The study covers medical expenditures of farm families in 25 States in the North Central and Southern regions during 1941 and 1945. During this period average medical expenditures in the South increased from $41 to $70, and in the North they inereased from $41 to $70, and in the North they increased from $64 to $101. This indicates that although the South is behind in medicine expenditures, it is increasing the amount of medical eare per farm family at a somewhat faster rate than the North.

The leading item of expenditure for medical care both North and South was physicians' services. This was true in 1941 and in 1945. During the period expenditures for physicians' service increased from $25 to $46 per farm family in the North and from $14 to $30 per farm family in the South. Second highest expenditure in the North was for hospital care; in the South it was drugs and medical supplies. This seems to indicate greater prevalence ef self-medication in the South than in the North.

And Some Want It Here

The believers in the totalitarian state always argue that that form of government does the most to advance the interests of the "common man." They prate of production for use instead of production for profit, and point to the achievements of dictatorship in advancing the standard of living of the worker.

In the light of that, some figures concerning the Russian economy are of interest. In less than a year, the price of black bread, the staple item in the diet of the average Russian, has increased 240 per cent. Milk has gone up 220 per cent, sugar 196 per cent, butter 136 per cent and beef 114 per cent. The cost of clothing and all manufactured goods have also advanced tremendously, and are usually unobtainable at any price. But, in the same period, the wages of Russian workers have gone up only 25 per cent.

The "fortunate" Russians are not burdened with a free, competitive economy such as that in the United States. They don't have to suffer along with such typically capitalistic monstrosities as great factories producing a growing flood of consumer goods—nor do they have chain stores and independent stores all competing with eaeh other for consumer favor. In Russia everything is owned and controlled by the state, and the factories produce and the stores sell only what the masterminds at the top think fit and proper. The result, according to a U. S. Department of Labor survey, is that the living standards of American workers are about 1,000 per cent above those of their Russian counterparts.

Keep that in mind when you hear the virtues of Communism and other "isms" compared to the vices of the competitive free enterprises system of production and distribution.

Pumpkins, Squash Require Storage in Warm Place

By Dr. Floyd Bralliar,
Garden Editor, The Nashville Tennessean

Storage of vegetables is a big problem just now to many who have grown gardens for the first time.

In fact it should be thoroughly understood before we put away our vegetables for the winter. Some vegetables require storage in a dry moderately warm place. Others keep best in a cool place that is fairly moist. Pumpkins, squash of all kinds, and sweet potatoes come under the first class.

Pumpkins and squash, in order to keep well, should be gathered before the first heavy frost, though they will stand a moderate frost without serious damage. If we wish them to keep well, we should cut or break them from the vine in such a way as to leave at least an inch of the stem on the fruit.

If we break the stem off of the fruit, it is almost sure to injure it and juice and water will run out of the scar where the stem was broken off. Such pumpkins will keep for awhile, but they are almost sure to spoil within six to eight weeks. In harvesting, be careful not to bruise the pumpkins. Store them at once in a dry place where they will not lie on the damp or wet floor. If the floor where they lie is wet or even moist, mold and decay are almost sure to result.

Neither pumkins nor squash are fully mature when they are picked from the vine. In fact the seeds themselves continue to fill out and increase in weight for two or three months after the fruit is put in storage.

Squashes and pumpkins keep best at a temperature of 45 or 50 degrees though they will keep all right if the temperature falls as low as 40 or goes as high as 65 or 70. They do not keep well when piled up in heaps, or filled into barrels or bins. They need a good circulation of air at all times. Given these conditions they should keep in good condition until Mareh or April.

Better Farms

(1) Winter legumes are the basis of the soil building program on all farms. Corn and cotton stand drought better and make highest yields if winter legumes are grown in the rotation. Effect of winter legumes in helping corn and cotton through dry weather is very noticeable this year.

Records show that farmers who plant the most winter legumes get best yields and made the highest incomes. They are also balancing their crops with livestock. Now, as never before, winter legumes should be planted to supply nitrogen for next year's corn crop. Indications now are that nitrogen materials, such as nitrate of soda and other sources, will be as scarce in 1948 as they were in 1947—perhaps scarces.

(2) Planting of winter legumes should be finished by about the middle of October. For success with them use basic slag, phosphate or 0-14-10.

(3) Inoculation of legume in inoculating crimson clover, if you are planting it the first time.

(4) Lupines planted where peanuts are dug protect the soil, add nitrogen, and increase next year's corn yield. Lupines should be on every acre where peanuts are dug and also on many other acres. Seed are available, you may save your own seed next spring.

(5) Many Alabama farmers can whip the winter legume seed shortage by growing their own seed. Extra seed can be sold for cash. Sale of seed is bringing in considerable extra money on many farms. Smooth, Monantha, and Williamette vetch and crimson clover seed can be produced in the northern half of the State; blue lupine and Manganese burr clover in the southern half of the State; and Caley peas and vetch in the Black Belt.

The European Road

It has been but two short years since the United States showed its ability to produce the materials needed to win World War II. The electric utility companies of the nation rendered outstanding service in making this production possible. They were able to supply electric power when and where needed to meet the exhorbitant demands of war. This is the record of one of the nation's outstanding industries during a national emergency.

President Truman is asking a quick start on a ten-year program for controlling floods and developing the water resources of the Mississippi River basin. This is sound non-commercial function of government. But it is a safe bet that the advocates of socialized electric power in the United States will use flood control as the vehicle to build power dams and proceed with such tax exempt properties to foree present private electric companies into government ownership in the territory affected, thus establishing a government monopoly of electric power in another vast area of the United States.

President Truman makes no reference to existing electric companies in the flood control message, no invitation is given to private industry to work with the government in the development and distribution of eleetrie power at the various dams. If allowed to do so, private enterprise, publicly regulated, would undoubtedly be glad to joim with the government in financing electric development, thus saving the hard-pressed taxpayers enormous sums. Investor-owned electrie companies would thus be ereating vast new taxable assets to help support government, in contrast with government-owned tax exempt power plants whieh gradually put taxpaying private plants out of business.

This is something to think about unless the country is ready to go whole hog towards socialization of industry. Are we going to follow the European road to the ultimate destruction of private enterprises and individual opportunity?

For vitamin C eontent, combine shredded cabbage in salad with grated turnip and generous slices of green pepper.

Gettin' Harder All the Time to Keep 'Em Down on Farm

By Robert E. Geiger

WASHINGTON— (AP)— That old question of how to keep 'em down on the farm still hasn't been solved. In fact it's getting tougher all the time.

A study of the growth of metropolitan districts has just been completed by the census bureau and the Scripps Foundation for Research in population. It shows the lure of the big city has attracted the farm boy and girl all through the years.

Lean depression years dimmed but didnt' extinguish it. The war spurred it on, and now the census experts say the signs indicate the trend will continue at least into the next decade.

But the cities of the South and West are challenging the older industrial areas of the Northwestern and the North Central states. This has been going on for 20 years. Discussing its study of this regional trend, the report says:

"The general conclusion justified by such a study is that the relatively rapid and steady regional increases in metropolitan population in the West and South will continue and that these regions will absorb metropolitan population at the expense of the Northeastern and North Central States."

In discussing farm-eity population will, of course remain about stationary or will decline, depending on the magnitude of the movement to metropolitan districts.

That is. few people are expected to move from the city to the country.

But the proportion of "cliff dwellers" living in big city apartments may decline. People—and industries—appear to be seeking the elbow room of surburs and rural metropolitan centers.

In 1900 there were 44 metropolitan areas in the U. S. with a central city" containing 100,000 or more population. These contained 25.5 per cent of the U. S. population.

By 1940 there were 140 metropolitan areas, and they contained 40 per cent of the population.

These two figures aren't exactly comparable because the census bureau has made changes in defining metropolitan population.

Nevertheless the growth of huge metropolitan areas has been steady and strong and the trend is continuing. A study of 34 metropolitan areas by the census bureau last April indicated they eontain one-third of the nation's population.

Yet these 34 areas don't include all of the 34 largest.

The census bureau-Scripps foundation report discusses these trends toward an increase in industrialization in the South and West:

Only a very few metropolitan areas had a birth rate high enough in 1940 to maintain their population level. Therefore they had to draw workers from the rural areas. The South has the largest natural inerease of any part of the country.

The South has had a steady increase in its proportion of manufacturing wage earners from 15.7 per eent in 1917 to 20.4 per cent in 1940.

Then during the war, from July 1940 to May 1944, the South reeeived 24.4 per eent of the fourteen million dollars the War Production Board authorized for manufacturing plants and equipment. The cost of plants whose conversion to peace time industry is "extremely doubtful" is excluded. The west received 12.8 per cent of these expenditures.

These percentages are a substantial increase compared with prewar years.

The report says this expansion of wartime industry in the South and West isn't proof that the growth of peacetime industry will continue. But it adds that the conclusion "seems fully justified" that there now are larger manufacturing facilities in these regions in proportion to those in the Northeast and North Central states."

And the most startling fact in war time population studies has been the huge increase in western population. The three pacific coast states gained 3.281.000 people, or an inerease of one-third. All the other 45 states increased only 3,-712,000 or three per cent.

Farm Talk With Farm Folk

By Jesse Safley

About this time each year when the nights become chilly and damp, thousands of farmers and farm boys, with their dogs, guns and lanterns, take to the woods and fields for a few hours of recreation in the form of 'possum hunting. Many of them have already put in 10 or more hours a day, but a few miles tramp through woods. weeds, briars and over fences offers a certain amount of pleasure.

Hunting is pleasure, but often a night of fun and relaxation is turned into one of sorrow and suffering because someone was careless about handling a gun. Maybe, his earelessness was due to excitement, then again the hunter may have failed to think.

We often read or hear of someone being accidentally shot when they tried to cross a fence with a loaded gun. That is a case of not thinking. A much sadder incident involved two brothers in their early teens. The brothers over opposition of their mother who consoled herself with the idea that the boys must learn to handle a gun someday carried a gun along on a short hunting trip one night after supper.

With a young dog that never had treed a 'possum, the two boys worked eagerly with their young animal attempting to train him into a "tree-dog." After sometime without success, they were ready to turn back, but in the distance (some 300 to 400 yards away). they heard the barks of their dog.

Afraid that the inexperienced dog would leave the spot before they could get there (if you have ever run toward the bark of a dog you know what we mean), the boys began their mad rush toward the dog. They reached the scene in time and found only about 20 feet from the ground, a 'possum with its tail wrapped around the limb holding on for dear life.

The hunters' first impression was to shoot the little animal off the limb, but on second thought, it would be good experience for the dog to have the privilege of killing it and they were anxious to surprise their parents so they decided to climb up the tree and shake the 'possum off. Almost instantly, one of the boys was about 15 feet off the ground shaking the limb on which thee 'possum held close. After much effort, the animal fell to the ground and the small dog began to work on him.

The animal was larger than the boys had surmised and too large for the dog to handle. As the scuffle continued, the boy which was in the tree dropped to the ground and grabbed the gun to assist the dog. As he carelessly swung the gun around attempting to shoot the 'possum it discharged and the shot hit the other boy.

Fortunately, the incident was not as bad as it might have been because the young hunter was not killed. However, he did lose an arm.

Similar accidents are occuring somewhere in the country daily, Many of which result in the loss of life. Losses caused through hunting are by no means confined to the hunters themselves. Often livestock is killed by stray bullets. Destructive fires, burning both property and wild life, result from hunting and sickness caused by exposure are all major problems.

There are many simple rules a farmer and his family might follow and still enjoy hunting just as much wiehout taking so many chances. They include:

1. Allow only members of the family to carry a gun who will not become excited on sight of game.

2. Never cross a fence with a loaded gun.

3. Don't build fires unless it is necessary and in case a fire is started, be sure it is located on a clean plot of ground.

4. Make sure all fire is out before leaving it.

5. Allow no hunting on your farm unless some member of the family is with the hunting party.

6. Keep hunting parties small in order that each member will know where other members are.

7. Avoid exposure.

Plan Now

To allow hunting on your farm only when some member of the family can go along with the hunting party.

To be careful about driving a wagon, truck or other farm equipment up and down hills when the ground is soft as you would about planting rows up and down the hill in the summer.

To cull and sell all obvious nonproducing hens and also those which have reached the age of unprofitable production.

To destroy all weeds and grass in and around the garden which might serve as winter quarters for destructive sects.

To start a rat-control program.

To have everything ready for hog killing when the temperature is right, but be sure that it is cold enough before slaughtering. Many families lost their entire meat supply last year because they killed when the weather was uncertain.

Better Farming Methods Sought for Puerto Rico

The U. S. Department of Agriculture has announced its approval of research on erosion control and more efficient production of food and feed crops in Puerto Rico.

The research work will be conducted under the research and marketing Act of 1946 and will be done cooperatively by Soil Conservation Service, the Bureau of Plant Industry, Soils, and Agricultural Engineering and by the Puerto Rico and the Federal Agricultural Experiment Stations.

In approving the project, E. A. Meyer, administrator of the new act, pointed out the serious need for cropping systems better suited to the characteristically steep lands of Puerto Rico. He especially emphasized the urgency of taking steps to retard soil erosion which is moving apace in the island at a disasterous rate.

There are nearly 600 persons to the squar mile on the island who are largely dependent upon agriculture as a means of living, Meyer said.

The research program will seek to develop soil and water conservation practices that will permit the growing of such crops as corn, vegetables, bananas, and other fruits on the steep and highly eroded land of Puerto Rico with a minimum loss of soil. The program will also aim at increased production the square mile on the island who for direct or indirect consumption by the people living in the hill country of the island. Approximately 75 percent of the land is elassified as hilly and mountainous; and it is estimated that more than 25 percent of the topsoil has already washed away.

Foot-Long Fruit Tree Limb Bears Two Dozen Apples

Livingston, Tenn., Dec. 1—(Spl.)—An apple tree limb about a foot long and less than an inch in diameter and bearing two dozen apples is on display in the Livingston Enterprise office.

The limb is from a tree grown from a seed by Riley Masters of the Buffalo Hill Community. Masters said the tree is of the limbertwig variety and it produced 10 bushels of fruit this year.

Of the 500.000 people in the United States estimated to have tuberculosis. only about half are known to health authorities. Christmas Seal funds support programs to find the "unknown" cases.

Food Saving Plan Set-Up in Tennessee

By Robert Battle

Economics in livestock feeding, through special measures and greater efficiency, are vital to the success of our present efforts to meet a great international crisis.

That is the general theme of the seven-point program outlined by the Tennessee Livestock Feed Committee for the conservation of food to help foor the hungry peoples of Europe.

In keeping with President Truman's three-point conservation program to make more food available for shipment to hungry people abroad, Gov. Jim McCord recently appointed C. E. Frehm, acting president of the University of Tennessee. and O. E. Van Cleave. State Commissioner of Agriculture, to select the Tennessee committee.

Meeting at the extension service office at 2327 West End Avenue, the committee adopted a program for the saving of food and farm products in Tennessee, calling for the eating of poultry at least two days per week.

The committee felt that having poultry on the menu would aid in the saving of grain, and "help to relieve a prospective meat shortage." The group also advocated the eating of the whole slice of bread "including the crust."

While government reports indicate the nation is eating 17 per cent more per capita now than in previous years, it is understood that farmers are working harder to meet the demands of the consumer public.

"Urban and farm people must cooperate in the conservation of food and grain by inaugurating food saving programs," the members said.

Eradication of Rats

In keeping with a drive begun earlier this year by the State Department of Agriculture, the committee advocated the eradication of rats. The rodent is said to be one of the principal "destroyers" of grain and farm products this year.

In carrying out the program, it was pointed out, "it will be necessary for everyone to make some sacrifice. Everybody will agree to sending bushels of wheat to Europe, but it means more than that. as it represents the production and home consumption of meat, milk and eggs, as well as all other foods."

The group agreed to support actively the Natioal Good Conservation Program. They believe this program applies to all people, both producers and consumers.

"The feeding of hungry people of Europe is a program of our national government and since it is a sound program, should be supported by all," the members resolved."

Main Point of Program

One of the main points in the program—which shoul dhave been practiced all along by farmers and land owners—is the culling of all non-profitable animals from the farm.

The committee asked for an increase in grazing crops next year. This calls for seeding wheat and rye through December and seeding of spring oats for hay and grain. They advocate controlled winter grazing, and ask land owners and renters to avoid over-grazing. A big help to the land, they agree, will be the spreading of a mixture of manure and fertilizer on pastures during the winter months.

An over-all point, so to speak, is "save food in its preparation and use for human consumption and use common sense in all livestock feeding programs."

In recognition for outstanding work, Brehm and Van Cleave have received letters from Charles Luckman, chairman of the Citizens Food Committee, and Clinton P. Anderson, secretary of agriculture.

Members of the committee are C. E. Wylie of the U-T College of Agriculture, chairman; Dr. E. A. Wright of the Hermitage Feed Mills; T. J. Hotch, president of the State Farm Bureau; Paul Dykes, master of the State Grange; Carl Fly, state director of the Production and Marketing Administration; G. E. Freeman, director of vocational education in the high schools of the state; Dr. V. L. Fuqua, assistant commissioner of agriculture and secretary of the committee, and State Sen. John Thomason of Nolensville, representing the dairy industry.

J. W. Brimm, with the department of vocational education, served on the committee for Freeman. Commissioner Van Cleave gave advice on the working up of the program.

Make the Farms Hum

By Grace Armstrong Allen

Last spring how we all grumbled because winter with his freezes and wheezes outstayed his welcome. This fall has found summer equally reluctant to pack up her bright warm hours and leave. But now at last she has surely gone. Autumn has charge of the erath and has poured tardy color into the leaves (we drove past beeches of pure gold yesterday), and would have made "the frosted asters like a smoke upon the hills," if there had been enough aster to frost. The outdoor work of the bees has ended.

The last job of the beekeeper is to insert the contractors into the entrances. I hope everyone has done this. Not to keep out the weather, which is not yet very cold, but to keep out the field mice. We used to be pretty leisurely about contracting entrances, and we know successful honey producers who still are. But we had some disconcerting losses from field mice, so now, no matter how mild the season, December seldom finds our entrances large enough to permit the destructive visitors to enter. Our hives are for bees, not for mice.

And now, this job done, the outdoor work of the beekeeper also has ended. If bees can appreciate anything, they appreciate being undisturbed in winter.

During mid-October, I was in Western New York State a few days. It was mild there, too, and one day someone called me outside to see honeybees on goldenrod. Later I did see some, but the insects on that particular goldenrod were not honeybees. They were bees, but not honeybees. "Oh," said someone in the party, "I thought bees were bees."

Most people think there are only two kinds of bees, honeybees and bumble bees. I don't really know how many kinds, of species, have been idcntified and named. But there must be thousands.

There are large bees and small bees, hairy and smooth bees, banded and plain bees, black, brown, gray, blue, green, red, and iridescent bees. There are carpenter bees, pasterers, and masons. Some make tunnels in the ground for their nests, others take over the burrows of our unloved field mice. Some nest in loose masonry, and others in wood, as in porch posts; others in plant galls or plant stems, like raspberry stalks; some nest under stones and some in deserted snail shells.

Most of these different bees would not be mistaken for honey bees, but several of them are very similar. To make it sound even more complicated, some bees look like wasps, and some wasps look like bees: in fact, some flies do too.

Once, years, ago, when I was visiting the University of Colorado in Boulder, I had the happy privilege of meeting the distinguished entomologist, Dr. T. D. A. Cockerell, who graciously showed me his famous collection of bees. There were uncounted specimens from all over the world, all sizes and colors. I was told, though not by the modest scientist himself, that it was one of the outstanding collections of the world. It was destined for some museum —the American Museum of Natural Science, I believe. What I have never been able to forget is that more than 700 species had been collected right there in Colorado.

If we could select as a motto a single sentence to hang above the table around which the dignitaries and representatives of the United Nations conferences sit, in an endeavor to iron out the world's differences, it would be this: **"Above all nations is humanity."**

WOMAN'S PAGE

Do You Have a Sweet Tooth?

French Fondant

2 cups sugar
1-4 tsp. cream of tartar
2-3 cup water

Put sugar and water on heat and stir until it begins to boil. Remove spoon, and with a brush dipped in cold water wash down the sides to keep sugar crystals from forming. Cover and boil for five minutes. Add cream of tartar and cook until it reaches soft ball stage, or to 230 degrees F. by thermometer. Remove from heat and turn out on marble slab which has been dampened with water. Let stand until a dent can be made on the surface. Then work the candy back and forth with a wooden spatula to a white, smooth, creamy paste. Knead, put in earthen bowl, cover closely with a damp cloth and put in a cool place for 24 hours.

Fondant is not perfect when it is granular. If it granulates, water can be added and the fondant worked again.

Another fondant can be prepared without cooking.

FRUITED FRENCH PASTRY

1 1-2 cups canned fruit cocktail
1-2 cup whipping cream
2 tablespoons granulated sugar
1-2 teaspoon vanilla extract
12 Honey Maid graham crackers

Drain fruit cocktail thoroughly. Whip cream until stiff. Beat in sugar and vanilla. Fold in 1 cup fruit cocktail. Spread graham crackers with cocktail mixture and stack 3 crackers for each serving. Chill about 1 hour. Top with additional fruit cocktail just before serving. Serves 4.

Paul Whiteeman Fruit Sundae Pie

Quick graham cracker crust! Velvety ice cream! Luscious fruit cocktail!

Crumb Shell:

1 1-2 cups finely rolled Honey Maid graham cracker crumbs
2 tablespoons granulated sugar
1-3 cup softened butter or margarine

Blend graham cracker crumbs, sugar and softened butter. Pat into 9-inch pie pan, pressing firmly against bottom and sides. Bake in 375 degree oven for 8 minutes. Chill thoroughly.

Fruit Cocktail Sauce:

1 1-2 cups canned fruit cocktail
1-3 cup fruit cocktail syrup
1 teaspoon cornstarch
1 quart vanilla ice cream

Drain fruit cocktail. Mix syrup and cornstarch, heat to boiling, stirring constantly. Remove from heat. Add fruit cocktail and chill thoroughly.

Just before serving fill shell with ice cream and top with fruit cocktail sauce. Serves 6 to 8.

Turkey Turnovers

3 tbsp. butter
3 tbsp flour
1 cup milk
1-4 tsp. salt
1-8 tsp. pepper
1-8 tsp. celery salt
2 tsp. finely minced onion
2 cups chopped turkey meat
Plain pastry, made wih 2 cups flour
1 lb. can jelled cranberry sauce

Melt butter, add flour and seasonings. and mix until smooth. Add milk; cook until thick, stirring constantly. Add turkey meat and cool. Roll out pastry 1-8 inch thick; cut in circles, using 2 for each turnover. On one circle of pastry. place a spoonful of turkey, cover with second round of pastry. Press edges together, prick tops, and brush with milk. Place on cookie sheet and bake in a hot oven 350 degrees F.. about 30 minutes, or until well browned. Serve with or without a sauce.

To cut up raisins for baking use a pair of old scissors dipped in hot water.

Frankfurters with Spanish Rice

1 pound frankfurters
1 cup raw rice
4 tablespoons lard or drippings
1-2 clove garlic
3 small chili peppers
1 1-2 teaspoons salt
1 No. 2 can tomatoes (or 2 1-2 cups fresh cooked)
1 1-2 cups water

Cook rice in lard or drippings until golden brown. Chop garlic and peppers and add with remaining ingredients. Cover and cook slowly until rice is dry and grains stand apart (about 45 minutes.) About 15 minutes before the rice is done, add frankfurters, cover and steam. Serve rice on hot platter with frankfurters on top. Serves 6.

Savory Dressing

Saute 1-4 cup minced onion, and 1-2 cup celery, chopped, in 1-4 cup melted butter. Combine with 6 cups stale bread cubes, 1 tablespoon salt, 1 tablespoon parsley, minced, 1-4 teaspoon pepper, 1 1-2 teaspoon poultry seasoning. and 1-3 to 1-2 cup broth. Add 1 beaten egg. Mix thoroughly and stuff bird.

Spaghetti-Meat Loaf

1 pound ground beef
1 egg
1 teaspoon salt
1-4 teaspoon pepper
1 can cooked spaghetti in tomato sauce with cheese
Grated sharp cheese.

Combine and mix thoroughly all ingredients, except sharp cheese. Pour into greased loaf pan and bake in a moderate oven (375 degreese) 1 hour. Turn onto platter and sprinkle immediately with grated sharp cheese

---

Cold Fondant

1 egg white
1-4 teaspoon cream of tartar
1 tablespoon butter
1-9 teaspoon salt
2 1-2 cups sugar or more if needed.

Whip egg into froth with salt; add cream of tartar and sifted sugar, softened butter, and more sugar if necessary to make into stiff dough

---

SWEET POTATO CROQUETS

4 cups hot mashed potatoes.
1-3 cup hot milk.
4 tablespoons butter.
1 teaspoon salt.
1 egg beaten slightly
1 cup buttered crumbs

Mix milk. salt and butter with hot mashed potatoes. Dip in slightly beaten egg and crumbs. Bake 30 minutes in moderate oven (375 degrees, or until brown.

Chocolate Fruit Bars

1-2 cup dates, stoned
1-2 cup seedless raisins
1-2 cup candied citron peel, chopped
1-2 cup candied lemon and orange peel, chopped
1-2 cup nuts or blanched almonds or pecans
1 egg white
2 tbsps water
1 tsp. vanilla extract
Confectioners' sugar
Melted chocolate

Put all the fruits and nuts through a food chopper. Place the egg white in a bowl, add the water, vanilla extract, fruits, and enough sifted confectioners' sugar to form a stiff paste Pat out in a shallow greased pan. Let the mixture dry for four hours, then ice over with melted chocolate. When dry, turn out on waxed paper and ice the other side with melted chocolate. Allow to set, then cut into bars.

Frosted Fruit

1 egg white
1 tsp. ice water
Sugar
Small bunches of fruits

Beat the egg white until stiff, then add the water. Sprinkle some sugar on a sheet of white paper and set in a warm place. Dip small bunches of currants or grapes into the egg, then shake the sugar all over them; place on a wire rack for the frosting to dry.

In making angel food and sunshine cakes there are some general directions which should be followed: Sift the flour five times before measuring it. Have eggs chilled and perfectly fresh. Add a pinch of salt to the whites. Always fold in the flour and never beat the batter after the flour is added. When salt his been added, beat the egg whites until they are creamy. Add the cream of tartar and beat them until they are stiff; then stir in the sugar gently and fold in the flour. Eggs for angel food cake should not be beaten any stiffer than is necessary to hold up the sugar. but for sunshine cake they may be beaten a bit stiffer, though they should not be too dry. It requires from 40 to 45 minutes to bake these cakes. When they are taken from the oven they must cool in the inverted pan, and it is worth while to have the type of pan which is made especially for such cakes. The pans should never be greased as pans are for butter cakes.

Decorative coconut balls may be made from angel food cake. Cut the cake into small squares, clip the corners to round the shape, dip in plain white icing and roll in grated coconut. They may be decorated in candied fruit if you desire.

Angel Food Cake

12 eggs beaten slowly, but not too stiff and dry
1 1-2 cups sugar
1 cup flour after sifting several times
Pinch of salt
1 tsp. cream of tartar

For a chocolate angel food cake, follow the directions above, adding three tablespoons of cocoa to the flour.

A more elaborate version of an angel food cake follows:

Holiday Angel Food

1 1-3 cups egg whites
1 1-2 cups flour
2-3 cup nuts
1 1-2 tsps. almond extract.
1 1-2 tsps. cream of tartar
1 cup cherries, chopped
1-4 tsp. salt
1 cups sugar

Beat eggs with salt until frothy; add cream of tartar and beat until creamy but not stiff and dry; add sugar gradually and beat well; flavor; fold in flour. Roll cherries and nuts in one tablespoon extra flour; add to batter, using as few strokes as possible Place in pan; bakee about 50 minutes in moderate oven 300 degrees F., until firm to the touch and leaving the side of the pan.

Among the most versatile and decorative of cakes are those baked in little cups. These may be covered with creamy frosting and covered with coconut or topped with candied fruits and nuts.

Little Cakes

1-2 cup shortening
2 1-2 cups sifted cake flour
4 tsps. baking powder
4 egg whites
1 tsp. salt
1 1-2 cups sugar
2-3 cup milk
1 tsp. vanilla
1-3 cup milk

Place shortening in bowl. Sift together flour, baking powder, salt and sugar into bowl. Add 2-3 cup milk and vanilla. Beat 2 minutes on medium speed of electric mixer, or by hand. Scrape bowl and beaters Add unbeaten egg whites and milk. Beat for two additional minutes. Scrape bowl and beater Line up cake pans with waxed paper and fill one-half full of batter. Bake in 375 degree oven about 25 minutes.

Creamy Frosting

1-2 cup shortening or butter
1-2 tsp. salt
1-2 tsp. vanilla
1 1-2 cups sifted confectioner's sugar.
3 tbsp. cream

Divinity adds goodness and beauty to the candy plate.

Standard Divinity

2 cups sugar
1-2 cup light corn sprup
1-4 tsp. salt
1-2 cup hot water
1 tsp. vanilla extract
2 egg whites

Dissolve sugar, syrup, and salt in the hot water. Cook. without stirring, to 248 degrees, or to the firm-ball stage; wash down with a damp cloth any crystals that may form on the sides of the pan during cooking. Remove from heat and pour gradually over the stiffly beaten egg whites, beating constantly with a wire whisk. Add extract and continue beating until mixture will hold its shape when dropped from a spoon. Drop by teaspoonfuls on waxed paper or spread into a buttered pan and mark in squares.

Among uncooked candies we find coconut kisses, chocolate fruit bars and frosted fruits.

Coconut Kisses

1 tsp. almond extract
1-2 cup sugar
1 egg white
1 cup ground almonds
Shredded coconut

Mix the almonds, sugar, almond extract, and egg white to a stiff paste. Let stand for 24 hours. Color, if desired, and make into balls. Roll in coconut, pressing it in well. Then, roll in coconut again. Let stand to harden.

ROAST TURKEY

The skin of a turkey chosen for roasting should look clear and unwrinkled. Select a young bird. A turkey should be kept in the refrigerator at least 12 hours after being killed, to allow the meat to become white and tender. Wash the dressed bird several times and dry with cloth. Rub well with salt and butter. Make dressing of bread crumbs, season with melted butter or stock, pepper, salt, a little sage, onion and one egg to hold in shape. Stuff inside of bird with part of dressing, making the rest into balls. Place turkey in roasting pan uncovered with two cups water and put in hot oven (350 degrees F.). Allow 25 minutes to the pound, cooking an extra 30 minutes. Baste several times during cooking. Just before removing turkey from pan, place balls made of remaining dressing around turkey and allow to brown.

Cook neck and giblets until tender in enough water to make gravy. Have a pair of sweetbreads cooked and one can button mushrooms, which have been sauteed in butter. Add to giblets. This makes a delicious sauce to be passed after turkey is served.

For an attractive way to serve a turkey, make short baking powder pastry, cut in strips, bake and when turkey has been put on a tray, make fence rows around with pastry sticks and garnish with parsley.

Variations in dressing may be made by adding one cup of fresh oysters or one cup of raisins or one cup of boiled chestnuts to dressing.

Chestnut Balls

Boil, hull. and blanch enough Spanish chestnuts to measure a cupful; then mash smooth or run through the ricer. Put into double boiler one cupful of sweet milk, one tablespoon of butter, and cup of finely ground bread crumbs. Season with pepper and salt, using a little grated onion if desired. Stir until thick, remove from heat and add chestnuts. When cool, form into balls. Dip in egg ,then in bread crumbs, and fry in deep fat like croquettes. Keep warm and place on platter with fowls.

Broiled Turkey

Select a young fat turkey, about 8 to 10 pounds dressed. Have butcher quarter turkey. Brush cut side with butter. Salt and pepper. Place broiler pan second shelf position from the bottom, turn control to broil position. Leave door ajar. Broil for 30 minutes, turn turkey, brush skin side with butter, salt and pepper. broil 30 minutes. Turn turkey skin side down and turn heat low, close oven door and cook for 30 minutes. Remove turkey, slice and serve with gravy.

Curry Gravy for Turkey

4 medium onions
4 tbsp. margarine or butter
2 1-2 tsp. curry powder
1-2 tsp. turmeric
1-8 tsp. salt
4 1-2 tbsp. flour
1 1-2 cups diced unpeeled apple
1-2 cup celery crescents
2 1-2 cups water
2 chicken bouillon cubes
1-2 cup raisins

Saute onions in fat until yellow. Add curry, turmeric and salt. Add apples, celery and water in which bouillon cubes have been dissolved. Cover and simmer until tender but not soft. Add raisins and flour mixed smooth with a little cold water. Cook until thickened. Pour into center of rice ring and surround with sliced turkey steamed a few minutes to heat. Yield: Six servings

Cranberry Sunshine Relish

4 cups fresh cranberries
1 whole orange. quartered and seeded
1-2 small grapefruit, quartered and seeded
2 cups sugar

Put cranberries, orange and grapefruit through food chopper. Add sugar and mix well. Chill in refrigerator a few hours before serving. Makes 1 1-4 quarts.

Cranberry Apple Relish

1-2 1-lb can jellied cranberry sauce
2 large applies, cored, peeled, and quartered
1-2 lemon
1-4 cup sugar

Crush cranberry sauce. Run apples and lemon through food chopper. Add to cranberry sauce and mix thoroughly. Add sugar and allow to stand one hour to ripen. Makes about one pint relish.

Cranberry Apple Ice

Jellied cranberry sauce
Equal amounts of freshly-grated, peeled tart apple (3 to 4 apples)

Crush cranberry sauce with a fork Blend well with grated apple. Pour into freezing tray of refrigerator and freeze to a mush. Stir once during freezing. Cranberry apple ice may also be frozen solid and served in squares. Serves 8 to 12.

Cranberry Horseradish Relish

1 cup jellied cranberry sauce
3 tbsp. highly seasoned French dressing
1 tsp. grated horseradish

Crush cranberry sauce with a fork; then blend in the French dressing and horseradish. This relish is especially good with beef or ham. Makes 1 cup relish.

Household Hints

Use lemon juice or a 10 per cent solution of acetic acid to remove rust of tarnish stains from fabrics.

Warm water is best to dampen garments for ironing as it penetrates the fabric quicker. If the weather is hot and humid, be sure to iron the garments within an hour or two, mildew may develop if they are left longer

When you are wrapping a cake for mailing, wrap it in waxed paper and place it in a box surrounded with popcorn. This will protect the shape of the cake and the recipient can eat both the cake and the packing, too.

To get more juice from lemons, soak them in hot water a few minutes before using.

A strip of Scotch tape between the inside hat-band and the hat will prevent perspiration stains from spoiling the outside band of a man's hat.

THE MODERN FARMER

VOL XX. NASHVILLE, TENNESSEE, JANUARY 15, 1948 No. 12

Economic Highlights

Happenings That Affect the Dinner Pails, Dividend Checks and Tax Bills of Every Individual National and International Problems Inseparable from Local Welfare

The benefits given American veterans of World War II are the most extensive in the history of this or any other country. A few countries, notably Canada, gave their vets a larger amount of cash on discharge. But none went so far as the United States in attempting to provide the ex-GI with a good send-off when he returned to civilian life. Now, in the words of the United States News, "First phase in postwar care for World War II veterans appears to be passing. The readjustment programs—unemployment pay, job training, schooling—are at or past their peaks."

In July of 1946, some 1,700,000 veterans were members of the much-discussed "52-20" club, drawing the $20 a week which the government offered them for one year if they were unemployed. The figure is around the 500,000 level now. That decline was to be expected—hundreds of thousands of the recipients have exhausted their allotments, and relatively few healthy veterans who want jobs have been unable to find them. Again, the number of veterans drawing self-employment pay—which provides a maximum of $100 a month—has declined 40 per cent in a year. There are probably two main reasons for that—many men who decided to go into business for themselves found the going too rough and took jobs, while others have put their enterprises on a paying basis and no longer need the government help. In addition, self-employment is limited to a total of $1,040 for any veteran. It is an interesting fact, cited by the United States News, that 90 per cent of those still on the self-employment rolls are farmers.

One of the major question marks in the veterans' programs is home loans. At the beginning, it was believed that these would total an astronomical figure, as millions of ex-service men and women rushed home and began looking around for a place to live. However, it didn't quite pan out that way. A great many home-seekers were staggered by the cost of building or buying homes in the postwar market, and reluctantly decided to put off their purchasing until prices went down or their earning power increased. Even so, the Veterans' Administration has guaranteed more than $2,500,000,000 worth of home loans outstanding, plus over $150,000,000 of business and farm loans. That is a nice chunk of money in anybody's language, and no one knows just what is going to happen. So far, defaults on home loans have come to only $250,000. But they have increased substantially on a percentage basis. A good many people think that if construction costs ever do go down, thousands of veterans will walk out of houses which they have a very small investment of their own, but for which they must pay back-breaking monthly installments.

The biggest impact of the veterans has been left in the universities and colleges. Millions of them came home with a desire for advanced education, and the government had anticipated that. It pays

Sideline Trucking Business Helps Farmer Double Income

$12,000 Tobacco Crop

CLYDE JONES, center, Maryland tobacco farmer, and District Extension Agent Martin G. Bailey select seed plants for next year's tobacco crop. After examining the leaves of this plant for quality, they are looking at the flower. The flowers of all plants selected for seed are stripped of their open blossoms and covered with a paper bag to prevent cross-breeding with less desirable types. See plants are left in the field to grow to full maturity, while the rest of the crop is harvested and placed in curing barnes. During the last few years, Mr. Jones has planted 40 acres to tobacco. His crop has brought him an average return of about $12,000. Left to right are: Joseph Kent, the Rev. M. J. Foster, his grandson, Madison James, Mr. Jones, Mr. Bailey, County Agent J. R. Jennings and Gaines Scott. USDA Photo—9-29-47

Mr. and Mrs. Clyde Jones Maryland Farmers Prove That Careful Planning and Hard Work Pay Big Dividend

Washington, D. C.—How Clyde Jones, Maryland Negro tobacco farmer, expanded his operations from a horse, a cow, and 25 acres to a $30,000-a-year farming and trucking business in 18 years is a story of sound planning, thrift, and hard work, says District Extension Agent Martin G. Bailey.

In 1926 Mr. Jones was married and sharecropping 20 acres in southern Maryland with his father, says District Agent Bailey, but he wasn't getting ahead. So, he decided to move to Washington, D. C., and try to find a job—any kind of job and save up money to start buying a farm of his own. In the capital city he first took a job as a hotel porter and later as a truck driver for a hauling firm.

District Agent Baily says that by 1929 Mr. and Mrs. Jones had saved enough for the down-payment on 25 acres they had had their eyes on near Prince Frederick, Md. With a horse, a cow, and a little operating capital, the Joneses began raising tobacco and corn on part of their acres, while they built up the others for increased yields.

In addition to helping her husband with the tobacco crop, Mrs Jones also helped milk the cow, tend their garden, and arise a few chickens. This home-grown food supply kept them out of the grocery store, except on rare occasions. As a result, the $900 they received for their tobacco was all theirs. With part of it they finished paying for their farm and made a few repairs on their home; the rest they put aside in a modest savings account.

By following sound soil conservation and farm management practices, the Joneses inched ahead year by year, but their pace was a little slower by 1935, because now they had four youngsters—none of them old enough to help; and what's more, Mrs. Jones had to spend more time about the house with them. Farmer Jones was up against it for help; he wanted to hire some help, but how would he make it up?

He began thinking of that trucking job he used to have in the city.

Farming Problems of South Studied at USDA Outlook Parley

Washington, D. C., Nov. 10, 1947 —Problems of merchanization, population shifts, and cropping programs in the South were discussed here last week at the 25th Annual Agricultural Outlook Conference by white and colored Extension officials of the Southern States.

Along with the agricultural problems of the South, problems of other regions also were discussed at the conference which was held in the Department of Agriculture auditorium, November 3-7. Extension officials from all of the States were in atendance, including six Negro supervisors. They were: T. M. Campbell and John W. Mitchell, regional field agents, and State Leaders E. N. Williams of South Carolina; R. E. Jones of North Carolina; Ross W. Newsome of Virginia, and Martin G. Bailey of Maryland.

In weighing the farm problems of the South, officials of Extension Service and the Bureau of Agricultural Economics stated that significant changes have taken place in farming in that region. For example, they pointed out that many people have left southern farms. This, they said, has resulted in more intensive farming in some areas, greatly increased mechanization and the use of labor saving practices in most areas, and considerable retirement of land from crops in others, especially in hill areas which do not lend themselves to mechanization.

It was pointed out also that cotton and corn acreages were 25 per cent smaller during the 1946-47 crop-year than during the period 1937-41. But the acreages of peanuts, tobacco, rice, small grain,

(Continued On Page 4 Col. 1)

Reforestation, Care of Woodlands Heal Idle, Eroding Farms

On an acre of ground on the farm of Chester Mantooth in Polk county, Tennessee, some 600 tall pines stand as a reminder of the value of reforestation.

These pines also constitute a perpetual memorial to the efforts some 20 years ago of a small class of agricultural students who planted the seedlings on the eroded, worn-out slope.

Considerable emphasis is being placed now on reforestation and care of woodlands and the Mantooth farm, being a pioneer in this work for the lower East Tennessee region, was included in a tour of inspection made by forestry officials recently.

Participating in the tour were forester George B. Shivery, forester with the agricultural extension service; Charles L. Doughty, District 3 agent with the extension service; Arne C. Fosdal, Marvin Smith and C. L. Gouffon, all of the forestry department, Tennessee Valley Authority. Joining them in Polk County were farmers and county extension service personnel.

The planting on the Mantooth farm was cited as an example of what reforestation can do for eroded, worn-out land of which there is much in the Tennessee Valley region. In addition to their value in stopping erosion damage and putting to good use land which otherwise was worth little, these trees, planted 20 years ago, are now worth approximately $400 as pulpwood. If left to grow they will become valuable saw timber in a few years.

Chester Mantooth says he has no intention, however, of cutting any of the trees for a long time to come. "We just want to see what they will amount to," he says, "if we let them keep growing."

The trees, protected through the years from fire and grazing livestock, now average 54 feet in height and eight inches in diameter near the base. They contain a total of 40 cords of pulpwood, forestry men estimate. These experts say that the cordage will double in another 14 years. Not a bad return, Farmer Mantooth feels, from land that otherwise might have lain idle and subject to continued erosion.

Much reforestation work has been carried on in Tennessee and in the Tennessee Valley region during the past dozen years, Hazard, Shivery and Fostal point out, but much is still to be done This work has received considerable impetus from the TVA's interest and efforts in encouraging tree planting as a means of protecting steeply-sloping lands in the Tennessee river watersheds, and in operating nurseries to provide seedlings for this work. The Tennessee forestry department also maintains a nursery and provides trees for planting.

Since 1935 several million trees both pine and locust, have been set on thousand of acres of land in Tennessee counties, Henderson county, for example, has planted nearly 10,000,000 trees during that period. Henry county has planted nearly 10,000,000 trees during that period. Henry county has planted more than 6,000,000 McMinn county in East Tennessee stands third with nearly 5,000,000. Five counties which have planted between three and four million trees are Knox, Bradley, Jefferson, Benton and McNairy. Counties which have passed the two-million mark include Polk, Claiborne, Hardin and Roane. There are a number of counties where farmers and other landowners have planted more than a million trees. They include Blount, Carroll, Chester, Greene, Hamilton, Lawrence, Lincoln, Loudon, Meigs, Monroe and Rhea.

TVA Ftrester Fosdal estimates that in the past dozen years nearly 200,000,000 trees have been set on 200,000 acres of land in the Tennessee Valley which crosses parts of seven states. There are still nearly a million acres, he says which should be returned to forest.

Total acreage of the valley is roughly 26,000,000 and about half that is timber.

State Forester Hazard estimates that 5,000,000 acres of timber in Tennessee is in farm woodlands. These totals emphasize the need for attention to protection and proper care of woodlands as well as to reforestation. A continued supply of marketable timber from our forests cannot be assured unless these phases receive proper emphasis, the forestry men stress.

Hazard says woodland owners often overlook the fact that organized fire protection costs average only about six cents an acre, while replanting costs may run as high as $7 to $10 an acre.

The various co-operating agencies, however, make it very economical for landowners to join the reforestation movement. Valley landowners may get their trees from TVA nurseries at no cost merely by applying through their county agents and the state forestry department. For use outside the valley, trees are supplied at low cost by state nurseries.

Tobacco Marketing Time

Mr. and Mrs. Clyde Jones of Prince Frederick, Md., prepare their tobacco for shipment to market after it has cured in their barn for almost a year. The Joneses produce an average of 30,000 pounds of tobacco annually. From sharecroppers, they have climbed into ownership of 180-acre farm In addition to growing tobacco, Farmer Jones has developed a sideline business of hauling tobacco for his neighbors and for buyers at the markets. His gross income from farming and hauling now averages nearly $30,000 a year. USDA Photo 9-29-47.

More Fall-Freshening Cows

We need more cows that freshen in fall. This means more cows should be bred during December and early January. Some reason why we should have more cows freshening in fall include:

1) Fall-freshening cows produce the most milk—and most economically, if properly managed.

2) Cows freshening in the fall have two seasons of flush production. They produce well for 2 or 3 months after freshening. They then naturally should have another period of flush production during spring months as a result of good grazing and favorable weather.

3) Since most farmers have more time to milk cows during winter months, their cows should be in full production at that time.

TIME TO TRANSPLANT

(1) All trees, shrubs, and vines can be transplanted during December. Be sure the ground is moist when planting.

(2) Hardwood cuttings of ornamental plants (flowering shrubs and others) can be started. Use this year's growth for cuttings.

Nearly 1,000 Homes Destroyed by Fire Daily

Since this time yesterday, over 1,600 building fires have killed 28 Americans, destroyed nearly 1,000 homes, 140 stores, 80 factories, 6 churches, 6 schools, 5 theatres, and 3 hospitals, says the National Prevention Association on the eve of Fire Prevention Week, October 5-11.

Last year, 10,000 Americans were burned to death and $562,000,000 worth of property was destroyed by fire, according to NEPA. At the fire prevention conference last May, President Truman pointed out that the fire loss, in lives and property, which occured annually in our forest and rural areas make up an important part of the tremendous annual toll.

Common causes of farm fires are: (1) Defective flues and heating systems, (2) sparks on on-fire-proof roofs, (3) misuse of gasoline and other petroleum products, (4) spontaneous ignition of hay, oily rags, and straw, (5) defective electric wiring, (6) lightning striking unprotected buildings, and (7) hot ashes and coals, and open fires.

Means of fire prevention include: (1) Keeping flues and chimneys clean and in good repair, (2) keeping matches in a safe place and out of reach of small children, (3) handling hot ashes and coals carefully, (4) curing all hay throughly before storing, (5) no smoking in barns and other buildings where there is danger of fire,(6) making sure that electric wiring is properly installed, (7) keeping gasoline, kerosene, and other inflammable supplies stored in a safe place, and (8) cooperating with neighbors in organizing an efficient fire fighting and fire hazard inspection group.

Over 200 Exhibits At Fair

More than 200 exhibits of tobacco, corn, green vegetables, canned foods, poultry, livestock, baked foods, sewing, and handicraft were displayed by colored farm families at the Mitchellville, Md., community fair last week, reports County Agent James R. Taylor. Prize went to six families.

Scientific Cattle Feeding Important

The American Meat Institute has launched a program designed to provide American consumers with a maximum quantity of meat—and at the same time help conserve grain for shipment abroad under whatever European aid program the government finally adopts.

The plan is based on making the best possible use in 1948 of the available supply of corn—the crop which was hit unusually in 1947 by drought and hot weather. In carrying out the work, the packing industry will work closely with the agricultural colleges, the Department of Agriculture, and other interested agencies. One very important phase of the plan is to bring to the attention of farmers and livestock producers the results of scientific studies which point to the most efficient utilization of feeds of all kinds.

As the Elizabeth, New Jersey. Journal put it, "The Meat Institute, in placing scientific methods at the disposal of farmers and furthering conservation programs, is demonstrating once again it is not a packers' 'lobby.' but a practical conscientious trade organization." It is not generally known how excellent a job the packers have done in meeting an abnormal demand for meat—and at a profit to themselves of less than a cent per pound. They are vitally interested in the grain problem, as are farmers and the public at large. The best efforts of everyone involved, and careful conservation of our resources, will be needed to solve it.

Retain All Fallen Fine Fertilizer Leaves, They Make Fine Fertilizer

By DR. FLOYD BRALLIAR

The Nashville, Tennessean

In spite of all that has been said, thousands of dollars worth of the very best fertilizer will be burned or otherwise destroyed.

It seems too bad that this is true. This would not be so serious if our soil were thoroughly rich, but it is not rich. It needs the very fertilizer we are burning. We are talking about the burning of our leaves.

Within the next few days practically all of the leaves that have not fallen, will fall off of our trees. This is nature's way of protecting shade loving plants and keeping the surface soil fertilized. The roots of trees go deep as 40 or 50 feet and collect the rarer elements of the soil and carry them to the leaves in the form of sap. In the leaves they are gradually built into the plant tissue, but when fall comes and they are ready to drop off the tree, much of this plant food is still in them.

We can understand raking the leaves off of the lawn. While they would usually do no harm, if left there, they would soon be ugly to look at. But once they are raked off, they should be piled in a great heap in some out of the way place and covered with enough soil or fine brush to keep them from blow ing about or they can be built into a compost heap.

If built into a compost heap with either a small amount of soil or stable manure mixed with them, they will be ready to be used as fertilizer on the garden wtthin a few months. Fertilizers are entirely too hard to get these days and leaf mold especially is too high priced.

Every florist and other specialists in plant growing recognize that he must buy leaf mold (well decayed leaves) if he is to be successful in growing his pot plants and his cut flowers. Leaf mold is especially necessary to mix into the soil in which fine seeds are sown. If professional florists must have leaf mold, and are willing to pay four or five cents a pound for it, certainly the ordinary home-maker cannot afford to waste his leaves.

The behavior of men to the lower animals and their behavior to each other, bear a constant relationship.
—Herbert Spencer

Prepare Your Soil at Once for Spring Berry Beds

By Dr. Floyd Bralliar

Garden Editor
The Nashville Tennessean

Now is the time to prepare soil for setting strawberry beds next spring.

Strawberries are so universally liked and in recent years have been so high priced and hard to get that every gardener should set at least a few strawberry plants next spring. If you are to grow a heavy yield of berries of the highest quality on a small space, cover the place you expect to plant with a heavy coat of stable manure, the fresher the better, and this should be turned under about six inches deep, as soon as possible.

Can Stand Fertilizing

I know of no soils in Middle Tennessee that cannot stand this much fertilizing if the fertilizer is put on the first of January. I recommend further sprearing a light coat of stable manure that doesn't contain too much straw or other coarse material, over the surface of the patch as soon as the first heavy coat has been turned under.

The heavy coat of manure is to enrich thoroughly the deeper soil and the lighter surface coat is to condition the surface. If the ground is level, or reasonably so, there is no necessity of your sowing rye.

Set Vines in Spring

Strawberry vines should not be set out until early spring. But it is essential that you either treat soil as suggested above or throughly fertilize it in some similar way so that the fertilizer will have time to condition and throughly blend with the soil before setting the berry plants. Strawberries are gross feeders, and not only like rich soil, but soil that has an abundance of humus in it, and we know of nothing that will supply an abundance of humus in a short period of time and at the same time enrich the soid so well as stable manure.

A strawberry bed thoroughly fertilized and properly worked even though it be as small as 10 by 20 feet, will produce all the fresh berries the average family of five can use and may give them all they want for preserves.

Although U. S. farm production increased 25 per cent between 1939 and 1944, farm acreage increased only six per cent.

In many areas, sericea and annual lespedeza seed may still be saved. Also crotalaria and kudzu seed. Next spring there will be a strong demand for these seed at good prices.

Corn and cotton stalks, crotalaria, and other crop residues should be cut or disked onto the ground, as soon as crops are harvested. This will help protect soil from erosion and make land preparation easier next spring.

Here and There

LUCKY DOG

Give me an example of an indirect tax."

"The dog tax."

"Why is that an indirect tax?"

"Because the dog doesn't pay it."

The reason a dog is such a lovable creature is that his tail wags instead of his tongue.

Some years ago, a married couple in the back country in Northern New Jersey adopted a baby boy. When he reached the age of six years the need of companionship for this boy became apparent. Should they adopt another child? They decided that a grown, well-trained dog would more quickly provide not only companionship but protection as well. A fine well-trained Shepherd was purchased. It would be difficult to describe adequately what that dog has meant to that boy in many years. Twice the dog has saved the boy's life and once saved him from being lost after he had wandered away from home.
—Ken L. Bits

"And the Shepherds Returned"

" 'Twas good to see the Savior, yea, 'twas good,"
The joyful shepherds said when they returned
Unto the crippled one, who much had yearned
To go with them, but who instead had stood
While they were gone and watched the sleeping flock.
He too had heard the herald angels' song,
And grieved because he could not go along.

" 'Twas good to see the Savior, yea. I know,"
The crippled one replied, and there was light
In his tired eyes, a lustre heavenly bright,
And as they looked again his face did glow.
The others could not understand his joy.
What had he seen while they were gone away
To Bethlehem—to where the Savior lay?

What had he seen? the crippled everywhere,
Down through the ages, crippled some by sin,
Others by color, caste and orgin,
But Christ was with them all, His love to share,
And angel-choirs sang for them, "Peace! Goodwill!"
So when the others said, " 'Twas good to see,"
"Yea," he replied, "I know. He came to me."

Farmer Increases Income 300 Percent By Conserving and Improving His Soil

How O. W. Waddleton, Texas colored farmer, increased the porduction capacity of a down-at-the-heel 50-acre farm and upped his income by 300 percent is told in the October issue of Soil Conservation, a U. S. Department of Agriculture publication.

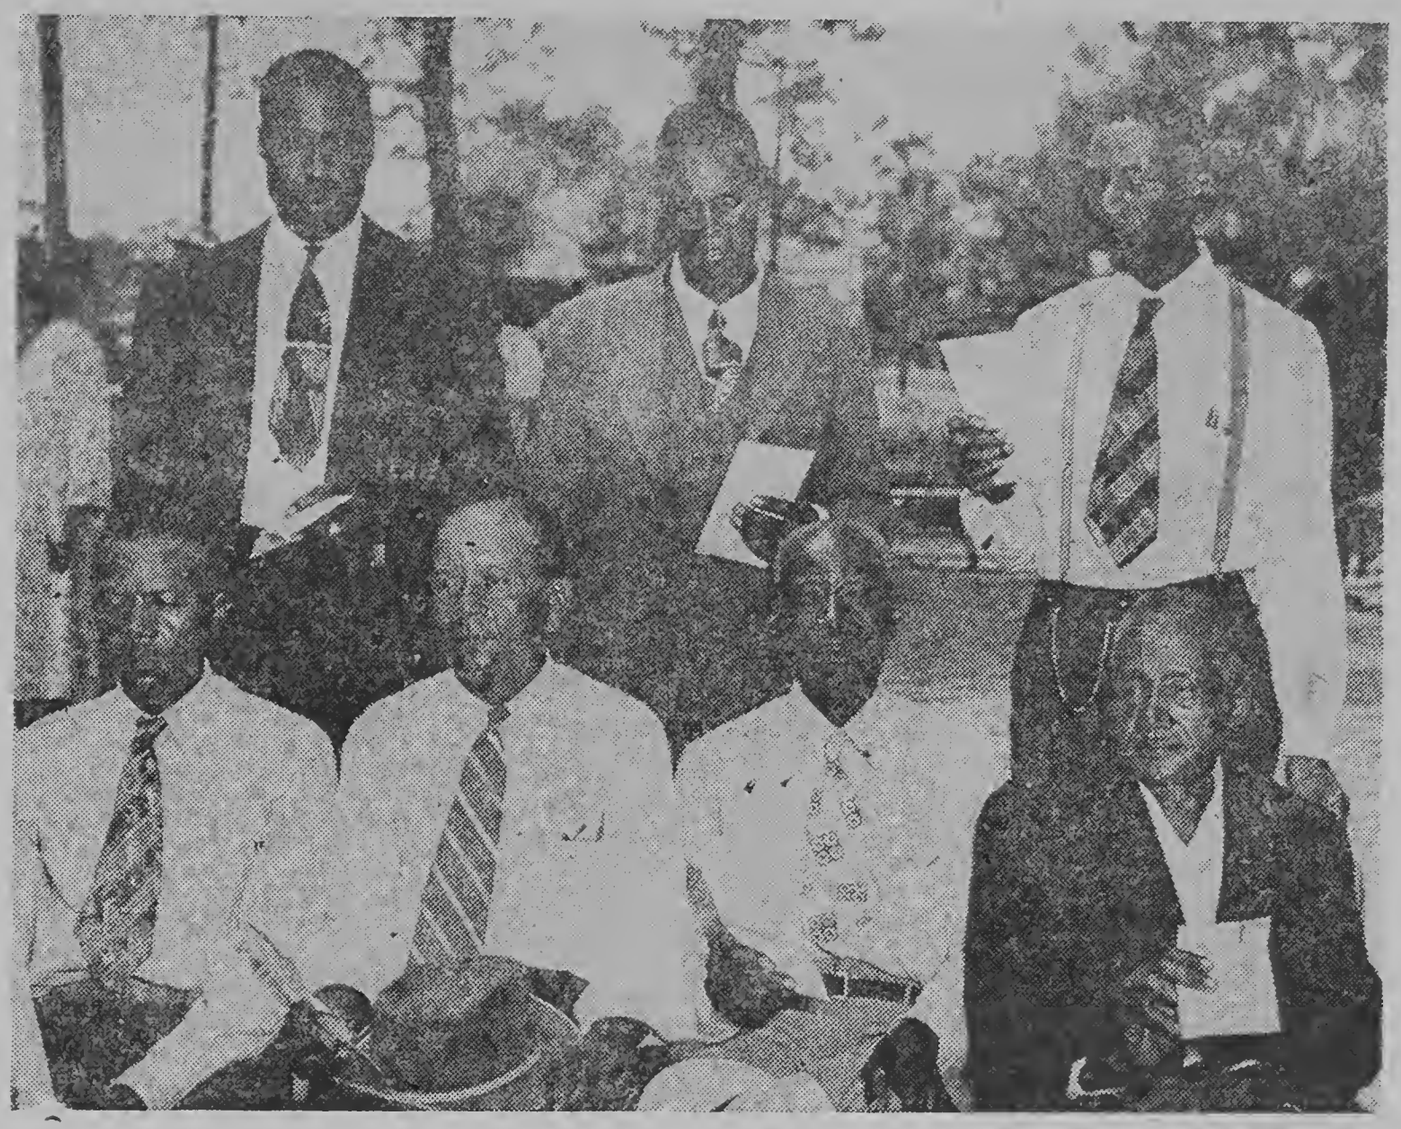
The magazine points out that despite long hours at the plow, Mr. Waddleton found it next to impossible at first to increase the yields on the run-down eroded farm he bought in 1939 through the Federal Land Bank for $450. Even after three years of hard work, he had little to show. The average income of his farm had gone up only from $500 to $770 a year, and that wasn't enough for his large family.

Then one day a neighbor told him about Soil Conservation Service and how this agency would help him build up and conserve the fertility of his soil. Farmer Waddleton went to see the supervisor of his soil conservation district and a technician was sent out to help him plan a conservation program.

With the aid of a conservation technician, Mr. Waddleton set to work saving his soil during the summer of 1944. Using his own workstock and the Hopkins-Rains-Wood district-owned equipment, he began a system of terraces to hold the rain water in check and stop erosion. Now he has 10,000 feet of terraces and his entire cultivated area has been seeded at least once, either to legumes or erosion-control crops.

By last year, Farmer Waddleton's cotton yield had increased from one bale to every five acres to one bale to every two; his corn from 10 to 30 bushels per acre, and his sweetpotatoes from 60 to 200 bushels per acre. From his cotton and sweetpotatoes alone, he grossed $1,100. When he added this to his income from peanuts, table peas, milk, livestock, and poultry, he had $2,110 in his pocket. Besides, he had his home-grown food supply and feed for his livestock. Now, Mr. Waddleton and his family feel that they are on the road to security.

Soil Conservation Champions



Seven of the South's ten colored soil conservation champions, who were awarded $100 each recently at the Log Cabin, Georgia, Jamboree, are pictured holding their prize money. The awards were presented to these farmers by Dr. Benjamin F. Hubert, director of the Association for the Advancement of Negro Country Life, in recognition of their having done the most outstanding job of conserving the soil of any colored farmer in their respective States. Seated left to Right are: Collin Johnson of Oklahoma, Jack Crump of Florida, William McClellan of Alabama, and Lee Lesley of Tennessee: standing are: Willie Long of Georgia, Cade F. Napier of Virginia, and N. B. Porter of South Carolina.. USDA Photo by Busch—10-6-47

Elmore Clubber Sets Pace With Hybrid Corn

Warren Allen, 15 year old 4-H clubber of Flatrock Community, Elmore County Alabama, claims the record among corn demonstrators this year. Warren produced 70.4 bushels of Tennessee 15 Hybrid Corn on one measured area. The corn was weighed pound for pound by a committee.

Landlord Cooperates

Warren lives with his parents, who are farmers on the Georgia Caldwell farm Route 2, Tallassee.

When the matter of Warren's project was discussed last fall, Caldwell agreed to advance recommended amounts of fertilizer and seed for the project. Fertilizer and seed were secured early in the year, and the land was well prepared by breaking and bedding.

Several hundred pounds of ferti lizer (4-10-7) was applied before planting. Three fourths of a peck of Tennessee 15 Hybrid seed was sown May 10th in the water furrow. About 35 days later the corn was side-dressed with 300 pounds of soda. Three cultivations were given.

The total cost of production, included fertilizer and soda, $21, seed, $2.50, rent $5, and labor, $10, was less than $40.

Placing a value of $2 per bushel on his crop, Warren has a net gain of $101.50 on his corn project. His success is opening the eyes of his neighbors. Adult and 4-H Club members made regular visits to observe step by step methods used in this demonstration.

Hybrid Wings On First Try

This is the first year hybrid corn has been tried by Negro demonstrators. Three adults also planted two acres each of hybrid corn.

These demonstrators averaged 45 bushels per acre. Compared with the county average from regular field varieties hybrid is way out front.

Request for hybrid seed and more information about how to grow it are already coming in. "It looks as if hybrid is moving in to stay," states Joseph Brandford, Negro county agent.

National Goals for 1948

Washington—National goals for 1948, calling on farmers for top production not greatly different from wartime totals, were announced today by Secretary of Agriculture Clinton P. Anderson. The goals seek a total of 356 million acres, of which 296 million are for cultivated crops and the balance for hay crops. This exceeds indicated actual acreages for 1947 by about 9 million acres and continues the high total sought through last year's goals.

With the exception of a few commodities for which the desirable 1948 output is still indefinite, the 1948 goals round out the production pattern recommended to farmers as a guide for next year. In some cases, as for poultry, goals are slightly revised from those announced earlier this year.

Underlying the continuing high goals is a recognition of the world need for food and this country's own high domestic-consumption requirements. This is particularly evident in the goals for wheat, feed grains, rice, and dry beans. To prevent the waste of production facilities through output in excess of demand, however, some shifts from war crops are indicated, in line with changing needs.

"Today, more than ever, U. S. farm production is a key factor in world recovery," Secretary Anderson said. "But, if this Nation is to provide a good share of the food needed so desperately by hungry nations abroad, it will mean an inevitable heavy drain on our already strained soil resources. The continued large acreages suggested for cultivated crops means a delay in working toward a better balance between soil-depleting and soil-conserving crops.

"Farmers must take all possible precautions to guard against irreparable damage to the land. In the years to come, this will mean an urgent need for greatly accelerated conservation."

Of foremost importance, because of the worldwide demand, are the goals for feed grains—corn, oats, barley, and sorghums for grain. These goals include a margin to provide for some shift as between wheat and other grains, since unpredictable factors, such as weather, may prevent reaching the full wheat acreage goal.

The world situation in fats and oils is still such that maintenance of high production is recommended for soybeans and flaxseed.

Goals for dairy products are set as high as practicable, in view of further decreases in cow numbers during the past year and the smaller feed grain supply available for next year. At the same time, the goal takes into account the prospective large demand for milk and its products and their generally recognized nutritional importance.

Poultry goals are revised in accordance with the President's Citizens Food Committee Program, which seeks to reduce the number of hens and pullets to 400 million by January 1, 1948. This is 20 million less than the goal announced September 10. The goal for eggs produced on farms now becomes 4.299 million dozen—92 percent of the 1947 indicated production.

Livestock goals will not provide all the meat needed to fulfill demands, but they represent the maximum believed possible in order to save the greatest amount of grain. Production of meat in 1948 at goal levels would total about 21.3 billion pounds, compared with the 23 billion produced in 1947. This should provide about 143 pounds of meat per capita for domestic consumption, compared with this year's 156 pounds per person.

Goals have already been established for wheat, rye, potatoes, and winter vegetables.

The goals announced today for other crops and for livestock and livestock products will be considered at meetings of State USDA Councils, which include representatives of federal and State agricultural agencies. The final national goals will be announced soon after the first of the year, after reports on local conditions and recommendations are received from States.

4-H Enrollment Up

The enrollment of colored farm boys and girls in 4-H Clubs has increased 22.3 per cent in West Virginia, reports L. A. Toney, State Leader of Negro Extension Work.

Mr. Toney says that 4-H enrollment has increased from 3,409 a year ago to 4,167 at present.

Fall Pruning Injurious

To Most Flowering Shrubs
By Dr. Lloyd Bralliar
Garden Suitor
The Nashville Tennessean

Already I am receiving inquiries as to when and how to prune trees, ornamental shrubs, and roses.

It never pays to prune flowing shrubs in the fall. Most flowering shrubs bloom early in the spring and their flowers bud are now on the branches, ready to open at the first touch of spring. To prune the early flowering shrubs now would usually mean almost a total loss of next year's bloom. Those later blooming shrubs such as crepe mertle and altheas bloom on wood that grows next year and they might safely be pruned in the fall.

Subject to Kill

But almost all such shrubs are subject to winter kill and if pruned in the fall they are almost sure to kill a few inches below where the cut was made, necessitating another pruning in the spring.

This is equally true with roses. Roses that are pruned in the fall almost always winter kill worse than those that are not pruned. Prune early blooming shrubs either when they are in bloom or as soon as the flowers fade, if they need pruning. Usually these shrubs need very little pruning. Prune roses in the early spring just before or just as soon as new growth starts, and prune the late blooming shrubs at the same time you prune the roses.

If you have time to do all the tree pruning in February and March, it would be better to prune most trees at that time, but do not wait that long to prune maples. They will waste too much food material in the form of sap.

Prune in December

Maples should be pruned in December or as late as the first week in January. If it is impossible to prune them at this time, by all means wait until the leaf buds swell so that you can see the green color in them, for by that time, the sap will no longer run, or it will only run a few days.

It does no particular harm to prune ordinary trees at any time in the winter. For it does not usually get cold good to injure seriously the live wood where the limb is cut off.

One question troubles many people who do their own pruning. They do not know what to use to are cut off. The United States Department of Agriculture has spent thousands of dollars over a period of 30 years to determine the correct answer for this question.

Until recently their experiments paint the scars where the limbs all seemed to show that white shellac is the best material to use.

Prepared as it is for use on a floor, it does no harm to plant tissue, yet keeps diseases of various kinds from establishing themselves on the wound.

The last report I have had from this experimental work, however, showed that lanolin, the grease taken from sheeps wool, is even better than white shellac. It costs less than most paint, and it not only does not injure the plant tissue, but it seems to have a decided effect in stimulating rapid healing of the wound. It is a pretty good rule to follow that all wounds as much as two inches in diameter should be painted and if the tree is a very slow grower, wounds as large as an inch and a half in diameter should be painted.

Tallapoosa 4-H Boy Sells Milk

Bobbie Heard, a 4-H boy of Jackson's Gaps, Tallapoosa County, Ala., says, "There is money in selling milk."

Bobbie's dairy cow has made a good record this year in the production of milk. He sells surplus milk to his neighbors.

He pastures his cow on a good permanent pasture and produces all of his other feed on the farm.

Bobbie's senior heifer ranked fifth in the Piedmont District Show which was held in Dadeville.

THE FORUM

The Modern Farmer

Published monthly by the Modern Farmer at Nashville 3, Tennessee.
Giles A. Hubert,_____
_____ Contributing Editor
Sadie Wilson _____ Secretary
Henry Allen Boyd_____ Publisher
Office, 403 Charlotte Avenue.

Devoted to the interests of the Farmer, Truck Gardner, Livestock and Poultry, Breeder, the Home and the People.

Entered as Second Class Matter, April 10, 1929, at the Post Office at Nashville, Tenn., under act of March 3, 1879.

All contributions for publication in the Modern Farmer, should be addressed to The Modern Farmer, 403 Charlotte Avenue, Nashville 3, Tenn.

No libelous matter will be published. Unsigned articles or letters, and those written on both sides of the paper will not be used.

Subscription price $1.00 per year, 75c for six months, payable in advance. Personal checks must be certified. Make all checks or money orders payable to The Modern Farmer.

Farming Problems of South

(Continued from page 1)

and hay were increased. However, for the South as a whole, the decrease in acreage used for crops totals about 7,000,000 acreas. Some of these acres have reverted to woodland, but most of it, the officials said, is being used for grazing or is idle. Increased grazing land has made for larger numbers of cattle. The conferees said that the number of cattle in the South has increased 23 per cent since the 1937-41 period, and poultry is up 11 per cent.

Among the questions raised in the discussion were: If off-farm job opportunities decline, will people return to the farms, thus forcing more intensive farming? Will some of the land now in grazing and timber be brought back into intensive use? To what extent can the present use of land in grazing and timber be made as profitable as more intensive enterprises? What part will increased mechanization play?

Some officials expressed the view that many people believe that increased mechanization during recent years has only partly filled the gap left by farm workers who have gone into other lines of work. This led to the question: Will the increased efficiency of manpower in the South which is resultng from mechanization prevent the return of farm people? Or will hand labor, by virtue of lower wages forced by unfavorable economic conditions, impede the progress of full mechanization even in areas adapted to its use?

Other questions raised were: Will fuller mechanization in the better adapted areas force farm people into the so-called subsistence or submarginal areas if they cannot find off-farm employment? Under favorable economic conditions, what will be the reaction of farm leaders and people in general to continued movement of farm people from certain areas, or toward their return under unfavorable economic conditions?

It was pointed out that one of the most important factors affecting next year's cotton acreage is the supply of labor. No significant changes in labor supply are in prospect, and mechanization, although on the horizon, will have little affect on the peak operations —chopping and picking — next year.

Food Consumption

(Continued from page 1)

Agriculture has announced. The basic purposes are to improve American diets and to expand consumption of farm products likely to be abundant.

Mr. and Mrs. Clyde Jones

(Continued from page 1)

If he had a truck of his own, he kept telling himself, he could make some extra money on the side hauling for his neighbors—perhaps enough to hire workers to do some of the back-bending tobacco chores and still have something for himself.

So, in 1936 Farmer Jones bought a small truck and began hauling tobacco to Baltimore at $18 a load. Three years later he hal two trucks on the road and the nest-egg he and his wife had been saving was large enough for a new $7,00 home with electrict lights and running water supplied by a gasoline motor they installed in a shed near the house. The next year Jones bought a bus and put in his bid for a school route. His bid was accepted and ever since either he or one of his sons has been carrying school children from outlying areas to the Prince Frederick school. During the summer months they carry picnickers to the beaches.

Four years ago the Joneses added 150 acres to their 25 and got two tenant families to help them with their 40 acres to tobacco. By cleaning and testing his tobacco seed, sterilizing his seedbed against diseases, spraying his plants against blue mold, and following other practices recommended by his county agent J. R. Jennings, Farmer Jones has increased his tobacco yield to nearly 800 pounds per acre. He was one of the first colored farmers in his county to follow the agent's advice on spraying tobacco plants against blue mold.

Today his tobacco yield averages over 30,000 pounds annually. This grosses him and his tenant about $12,000. From his school bus and two trucks—one of them a five-ton $8,500 trailer-truck-he grosses almost $20,000 a year. The Joneses finance their farming operations and the purchase of farming equipment through their Production Credit Association.

In order to secure lumber for additional curing barns for his larger tobacco crop, Mr. Jones went in with a neighbor last year and bought a small sawmill with which they saw up timber grown on their own farms. The Joneses have not only used some of their timber to build new tobacco barns which the county agent helped them plan, but also have used some of it to repair their tenant houses and for tobacco sticks. "You'd be surprised to know how much this little mill saves us," says Mr. Jones. "Later, we plan to do some custom sawing for our neighbors."

Mrs. Jones still helps with the tobacco, and with the garden, chickens, and the milking. Each week she receives a $7 milk and cream check, and sometimes she sells chickens and eggs in town. Two of the Jones children are married and living in town; the other two are helping on the farm. Clyde, Jr., does most of the tractor work and the daughter, Pearl, does most of the home chores. "I'll be 44 my next birthday," says Mr. Jones," and my family and I are aiming to take more time out for living."

Politeness is the curb that holds our worst selves in check.

God is where He was.

Farmers Home

(Continued from page 1)

Live-at-Home and Balanced Farming Competition sponsored by the Arkansas Press Association.

First place in the Negro landowner division was awarded to Horace Gray, 50, head of a family of seven, whose 80-acre farm near Luxora neted, last year, $13,822. Gray and other Negro winners were presented each awards at a luncheon meeting at Arkansas Baptist College.

With 75 of his 80 acres under cultivation Horace Gray had gross receipts totaling $17,922 from 50 acres of cotton, 14 each of corn and beans, five acres of alfalfa, six acres in pasture and two acres in garden and truck. A former sharecropper who bought his farm with a 40-year government loan and paid it off 36 years ahead of schedule, Gray operates his farm with the regular help of the members of the family all of whom are on the farm payroll. Total receipts last year were $17,-922 while the family and farm expenses were only $4,039.

Second prize-winner in the landowner division was Dave Evans, 48, of Emmett who farmed 52 acres, while third prize went to Clint Gordon, 32, a Farmers Home borrower who farmed 54 acres near Earle. Gordon and his family won the Arkansas "Farm Family of the Year" Contest sponsored by the Farmers Home Administration last spring. Selection was determined by managerial ability, farm and home improvement, soil conservation, increase in net income and retirement of indebtedness on the farm. Fourth place went to Toy Bomar of Greenbriar.

Honorable mention in the land owner division, all of whom are Farmers Home borrowers, are as follows:

Warren Wise of Nevada County; B. J. Parker, Arkansas County; Manley Rice, Miller County; W. A. Spears, Hampstead County; L. C. Barley, Bradley County; Earlie Weightman, Lincoln County; Clarence Ashford, Cross County.

First place winner in the statewide tenant division was awarded to William Hoskins, 51, of Driver, Arkansas, who showed a net profit of $11,243 from 200 acres all of which are in cultivation. His yield from 42 acres of cotton alone and the seed amounted to $10,070. Total receipts from the 200 acres were $15,915 with expenses listed as $4,172.

Second and third place winners respectively were also captured by Farmers Home Administration borrowers. They were Willie Stephens, 53, who cleared $3,006 on 23 acres near Marion and Frank Williams, 47, of Altheimer, who made $4,051 off 59 acres. Honorable mention in this division went to Sam Price of Montrose.

Certificates were also presented to 30 county winners in the landowner division and 25 county winners in the tenant division.

Editorial notice was taken of Horace Gray's achievement by both the Arkansas Democrat and the Arkansas Gazette, Little Rock dailies.

Under the heading "Negro Farmer Makes Fine Record" the Democrat for November 14 said in its editorial:

"A fine record was hung up by the first place winner, Horace Gray, in the Live-at-Home Contest for Negro farmers in the State this year sponsored by the Arkansas Press Association.

"The Gray family has gross receipts of $17,921 from their 80-acre farm near Luxora. Their expenses, mostly for farm equipment, came to $4,039, leaving them $13,822 in the clear on the year's work. . . . .

"As further proof of their system, the Grays bought their farm on a 40-year Farm Security (now Farmers Home) loan—and paid for it in four years. It has most of the modern conveniences.

"All of the family works and is paid on a weekly basis. This is a feature that many farmers might adopt, to the greater satisfaction of the young folks with farm life.

"The Grays are an honor to their race, and a credit to Arkansas."

Under the heading "A Sharecropper Makes Good" the lead editorial in the Arkansas Gazette for November 14, says:

"When the Farm Security Administration set out some years ago to finance the purchase of farms for Southern sharecroppers a full quota of skeptics stepped forward with dire predictions of failure. The years, however, have proved the tenant purchase program—limited though it was—a remarkable success. And rarely has it produced more spectacular results than it did in the case of Horace Gray of Luxora.

"FSA enabled the 50-year-old Negro, who had been a sharecropper all his life, to purchase a small plot of land in fertile Mississippi county. He paid off his 40-year loan in the first four years of his operation as an independent farmer, and steadily added to his holdings until now he owns 80 acres, 75 of it under cultivation. From that comparatively small plot of ground Horace Gray and his family last year took in gross receipts of $17,921.95 realizing a net profit of $13,822. This week Horace Gray's achievement was recognized by the Arkansas Press Association, which awarded him first place in its Live-at-Home competition.

"Inflation, which has sent the prices of all money crops booming, accounted for some part of Horace Gray's remarkable record, but it was no more than a contributing factor. His is a diversified farm effort—50 acres in cotton, 14 acres of corn, 14 acres of beans, five acres of alfalfa, six acres of pasture, two acres of garden truck and seven hogs. . . . .

"There is an almost miraculous quality in this story but it should not obscure the fact that Horace Gray's success is the product of his own inherent ability and determination. The government, by granting a small loan at a critical moment, helped him make the transition from 'cropper to landowner and Horace Gray did the rest. The government has rarely made a better investment."

Shelter, Water, Feed Needed for More Winter Milk

There is an extreme shortage of milk on many markets throughout the state. Steps not too late to take for an iincrease in milk production during November and the remaining winter months include:

1. Make shelter available for cows on cold and rainy days. A cow should not be forced to stand outside when it is too cold for her to graze. Keep plenty of good legume hay available for cows at all times, and especially on cold, rainy days.

2. Arrange for plenty of clean, fresh water for cows. They will not drink enough water if forced to drink ice cold water. Too often cows must break ice to get a drink. Milk is about 85 percent water; therefore, sows must drink plenty of water to produce milk cheaply.

3. Cows that produce more milk need more feed. If plenty of good winter grazing and legume hay are able to produce up to about 2 gallons per day with little or no extra feed. If cows are producing more than 2 gallons, of if plenty of good grazing and hay is not available, then grain should be fed according to production.

Economic Highlights

(Continued from page 1)

all tuition for a period of time which depends on how long each vet wore the uniform. It also gives a monthly subsistence check. This is the most costly part of the veterans' program, and it is expected that total enrollment in institutions of learning of all types will reach a peak of 2,500,000 this winter, and then start down. As the United States News observes, however, enrollment might start up again in a period of industrial depression and unemployment, which would force veterans to go to sschool to get an income.

GI education has been a terrific strain on our educational facilities. But, by and large, college officials have done an excellent job in handl ing it, and the vets and their families have cooperated. The temporary housing afforded certainly isn't luxurious in most cases, but it suffices. And, according to all the authorities, the ex-service people have made excellent students. They know what they want, and they are working hard to get it. They are serious minded, with little of the rah-rah spirit. They have done much to change the complexion of thousands of campuses. A New Yorker cartoon, showing a graduating exercise before an audience made up almost entirely of wives and small children, accurately caught the spirit of today's colleges with their GI enrollees.

A yet unsettled problem—which makes the officeholders look the other way when it is mentioned—is the possibility of a bonus such as was given to the veterans of World War 1. Several bills to this end have been proposed in Congress, but have gotten nowhere—the cost of a substantial bonus would be incredible, and many feel it would ube one of the most dangerous inflationary influences yet to appear. In the meantime, a number of states have dangerous inflationary influences yet to appear. In the meantime, a number of states have voted veterans' bonuses, and by very large majorities in each case.

One phase of the GI program which will cost billions a year after the temporary aids have ended is care of the disabled and the sick and their dependents. The tragic victims of the war are being given very good care now, and almost everyone has praised the work of General Bradley in reorganizing the moribund Veterans' Administration, which has been the scene of some disgraceful scandals in prewar years.

Mississippi Farmers

(Continued from page 1)

Mississippi, the farmers in that State are making marked progress in increasing their income from other farm crops. For example, last year they sold $32,894,000 worth of cattle and calves; $23,-285,000 worth of poultry and eggs; and $26,913,000 worth of dairy products.

Start Garden and Orchard

Get garden ready for next year by applying lime or slag. This job should be done once in four or five years. On 1-10 acres use 200 pounds lime or 400 pounds slag; on 1-4 acre use 500 pounds lime or 1000 pounds slag. Broadcast and plow in.

Apply manure once each year. The fall months before the land gets too wet to plow are the best time to do this. If you haul 1000 pounds to a load, four loads should be put down on 1-10 acre or 10 loads to 1-4 acre. A smaller amount will do good, but this amount is needed. Broadcast and plow in.

Do You Need Vitamins? If So Try These—

Many women who plan the meals overlook valuable foods which are low cost, or at least, not prohibitive.

Today I am going to outline a few of the highly protective foods to which you may not give proper importance and emphasis in your menu plans.

The collard green. Most Southerners know about this, but many of them consider it a very lowly food. Actually, it is king in the food field. It is an excellent source of vitamin A, a good source of vitamin B, and a fair source of vitamin C and B2. It also brings you splendid amounts of calcium, iron, potassium and phosphorus. What more can one ask of a food?

Beet greens are excellent for their vitamin A content and have fair amounts of vitamin B and vitamin C. They give you a wonderful B2 intake.

Kidney beans and dried navy beans are splendid sources of vitamin B1 and fair sources of vitamin B2. They both have a fine type of vegetable protein and can be substituted for meat.

Apricots are almost as good a source of iron as liver, and they also provide a wonderful vitamin A intake. Dried apricots are as valuable as fresh ones.

Beef, chicken, veal, lamb and pork are all important for their body building proteins. They contain fair sources of vitamin B.

Broccoli is high in vitamin A content and also contains good amounts of vitamin B2, and some B1 and C. It is also a splendid food because of its calcium and potassium content.

Whole grain cereals are a splendid source of the vitamin B complex.

Cabbage, especially when eaten raw is a fine source of vitamin C. This can take the place of citrus fruits when they are too expensive for large family groups to serve often.

Carrots are high on the list of vitamin A sources. They also give you some vitamin B1 and some vitamin C.

Milk and cheese should play a part in every diet. They are splendid sources of calcium, protein, vitamin A, phosphorous, and have some vitamin B.

Molasses and prunes are splendid sources of iron. All sea food is important because of its protein and, especially, because of its iodine content.

Whether you like them or not, turnip greens are a splendid source of vitamin A, a good source of vitamins B and C, and have important quantities of calcium and iron.

Perhaps we would all feel better if we would plan meals more for health than for the titillation of our taste buds!

New Farmhouse Plans Released

Six new farmhouse plans designed for modern rural living are now available, the U. S. Department of Agriculture has announced.

The plans were designed by agricultural engineers, architects and home economics of the Department in cooperation with the Extension Services and agricultural engineering departments of the State Agricultural Colleges.

Working drawings of the plans may be obtained through the Extension agricultural engineer at many of the State Agricultural Colleges. Orders may be placed through the county agents or home demonstration agents. Some States furnish plans free. Others make nominal charges to cover printing and mailing. Where the Extension engineer cannot furnish plans, inquiries may be directed to the U. S Department of Agriculture, Division of Farm Buildings and Rural Housing, Beltsville, Maryland.

Rub vinegar all over a fish and the scales will come off much more easily.

No Substitute for Work

J. J. Newberry, head of the national retailing chain system that bears his name, recently sent a message to store managers throughout the country which contains, in simple, forceful language, fundamental truths that apply to all of us.

He wrote: "The person who makes his job the most important thing in his life, other than taking care of his family. and who has common sense and intelligence to apply to his job, should be entitled to greater success and rewards than tne one who only wants to work eight hours a day, five days a week_____

"Everything in the way of farming, mining, manufacturing and distribution must keep on expanding to give work to the increased population and to produce and distribute the larger requirements of more people. This will call for more and more leaders of industry.

"Those leaders will be the people who have such enthusiasm for their work they would rather stay on the job and see that which they are interested in progress and grow than to spend their leisure time at less important pursuits_____

"When you hear bright young people talking about working only forty hours a week who expect equal compensation with the men who loves his work enough to put the necessary time in to make his company grow, then you owe it to such a person to tell him how wrong his ideas are."

This is an old-fashioned doctrine. It is in opposition to the new and engaging theories of the more advanced social and economic planners. But, whether we like it or not, it is a theory which is solidly supported by centuries of human experience—and human experiment. There is no substitute for production—which simply means there is no substitute for work. A genius may find an easy short cut to success, but the number of geniuses at large at any time can almost be counted on one man's fingers. Mr. Newberry has restated truths which, if abandoned and forgotten, will lead to individual tragedy and failure—and to the deterioration of the strength and pride of the country.

Search for Oil

The Coordinator of Producing for one of our leading oil companies says that a greatly expanded effort to find more oil in the United States and accelerated developments of foreign oil resources are essential to the peace time world as well as to provide vital reserves for this country in any national emergency.

He observed that many nations. including the 16 countries which fall within the scope of the Marshall Plan for European rehabilitation, are asking for more oil than present development plans indicate can be made available in the next few years. "One of the first facts we discover, when we try to assess our ability to meet the world's needs for liquid fuels now," he added, "is that the time is probably past when the United States can supply unlimited quantities to all who ask."

The oil industry has a man-sized job ahead of it. At present it is producing some 5,300,000 barrels a day—a record figure. Yet is is forecast that in two or three years domestic demand alone will rise to 5.600.000 barrels daily. The solution of the problem is aggressive development of every oil resource. here and abroad, which the industry can find and prove.

The Middle East constitutes the most important under-developed reserve now known in the world. American capital and engineering genius have a tremendous development program underway there, and by 1951 the region will be producing up to 1,500,000 barrels each day. Much of it will go to oil-thirsty Europe. Every possible step is being taken by the oil industry to meet the world's need.

Oil and More Oil

Can you visualize 85,000,000 gallons of gasoline?

That presents an impossible task for most of us. And that is the amount of gas that must be moved each day and every day to supply the United States' trucks, automobiles, busses, and other consumers of this particular type of motor fuel.

Yet that is only the beginning of the oil industry's job. During the first six months of the year, demand for all oil products averaged 5,780,000 barrels a day—which amounts to something like 842,000 tons.

The average consumer sees oil only when the end of the line has been reached—in the service station or in his home fuel tank. Quite naturally, he has little comprehension of the enormous organizing job that brought it to him. All of it began as crude oil in the ground in California or Texas or elsewhere. All of it had to go thru a complex series of refinery processes to produce a usable product. All of it had to be transported—by rail, by pipe line, by truck, by ocean tanker. All of it presented problems—some oil products are inflammable, some are explosive, some will deterioate in handling unless certain precautions are observed. Trained specialists, using costly special equipment, did the job.

But the gas and the diesel oil and the thousand and one other derivatives of crude keep on moving. More will move in the future, as demand increases and new facilities are put to work. One of the most efficient organizations on earth the American oil industry, is on the job 365 days a year in an effort to bring you the products you want, when you want them, at the lowest price possible under today's conditions.

Mistaken Comparisons

It may be human nature to compare current commodity prices with those prevailing in 1939 or 1940 and conclude that we are now being robbed. But it isn't sound economics. It would be equally sensible to compare 1940 prices with 1840 prices and conclude that costs have been extortionate for decades.

Another fallacy is to compare the conditions which followed World War II with those which followed World War I or some previous conflict, and to attempt to draw exact parallels. As one of the greatest historians said, "Nothing is permanent but change," and what happened in 1920 and the succeeding years won't necessarily happen again. History may repeat itself in principle, but not in detail.

Everybody passes the buck on prices—just as everybody wants a low price when he buys and a high price when he sells. This blindness to the facts of life has clouded the whole price problem. The workingman wants cheap food and clothing—along with all-time record wages. The farmer wants machinery at prewar prices—along with a record price for crops. Of course such a Utopia is an impossibility, and those who dance must finally pay the piper.

Prices are high. But that doesn't mean they are artificially high. The major retail systems, both chain and independent, report lower unit profits than they earned seven years or so ago. Many manufacturers report a similar operating experience. Both production and retail distribution are more efficient and less wasteful than ever before. The present price level is the inevitable result of many forces, and is a perfectly natural development. regardless of what the trend may be in the future.

Lawyer, reading client's last will and testament to circle of expectant relatives: "And so, being of sound mind, I spent every damn cent I had before I died."—Bill King in his Week Magazine.

Where the Cure Lies

The United States is a big country, rich in natural resources. It is also one of the most wasteful countries on earth. American carelessness permits the destruction of enough wealth to feed and supply a lesser nation.

Fire waste is a conspicuous example. Not long ago we suffered a series of terrible hotel fires, with a ghastly loss of life. A short time later the cataclysm at Texas City occurred. Most recently, we have witnessed the enormously destructive forest fires in New England, which completely wiped whole towns from the face of the earth, and turned millions of feet of fine timber into ashes.

These great fires made the headlines. But the bulk of our fire loss is made up of thousands of "little" fires which few people ever hear about. A home or a factory or a barn burns. The loss in each case may be relatively small. But when it is all added up the total comes to some $600,000,000 a year—and more than ten thousand lives. The indirect money loss is estimated to be two or three times as great as the direct loss. It is measured in diminished industrial and agricultural production, in unemployment, in reduced opportunities, and in the loss of taxable resources.
can prevent around 90 per cent of

Every expert knows that we can prevent around ninety per cent of all fires. he president's conference on fire safety, held in Washington last May, laid down a splendid all-inclusive program for battling the menace on national, state and local levels, and for educating the public. But it cannot succeed unless it is given a full measure of support by all the people. The great majority of fires are the result of individual carelessness and ignorance. And the cure lies with the individual.

Who's Asking Who How to Raise Baby Chickens?

Athens, Ala., Nov. 3—E. A. Zerzett, well-known farmer of Athens. Route 1, created considerable amusement recently when he walked into the county farm agent's office and asked information on how to raise chickens.

On questioning Berzett. the county agent found that only recently he purchased 2,521 baby chicks from Farm Industries in Decatur and that he raised all but seven to be nine weeks old, his total loss being only that seven.

The county agent told Berzett that he had nothing to learn but was in a position to give instructions himself about how to raise chickens.

There is more to life than increasing its speed.

Investigation of Fertilizer Output Asked.

Washington, Nov. 24—(AP)—A Congressional investigation into production and distribution of fertilizer before voting funds for foreign aid was urged today by Rep. Whitten (D. Miss.)

He made his appeal in a letter to Chairman Taber (R. N. Y.) of the House Appropriations Committee and Rep. Dirksen (R. Ill.) of the committee's agriculture sub-group. Whitten is a member of the committee.

An investigation, Whitten said, should be made to ascertain whether present production facilities are being fully utilized and how much fertilizer is available for domestic use.

"We do not want to have our domestic production sent abroad and have our domestic users dependent upon imports which may not arrive in time for use, as happened last year," Whitten said.

He said the War Department which is operating some war plants for production of nitrate fertilizers, borrowed 110,000 tons of fertilizers from commercial producers in 1946, agreeing to return a like amount in time for the 1947 crops.

The department, he said, didn't complete return of the fertilizer until July 1, 1947, and then it was delivered to UNRRA for allocation by the international food council. Domestic users, Whitten said, "had to look to imports of Chilean nitrate for a large part of their fertilizer."

Due to strikes and other difficulties, he said, most of the Chilean nitrate reached the southern region too late to aid the 1947 crops.

Whitten said that although the War Department is holding some war plants to produce fertilizers "at least one plant in Missouri is not operating."

He also contended that the Cactus Ordinance Plant at Etta, Texas, is not being utilized fully for production of ammonium nitrate.

"Since there is a great shortage of fertilizer, in my judgment our committee needs to know that all plants are being operated at full capacity and see that the war plants are enlarged if necessary," Whitten wrote.

"This will in no way injure the commercial producers since they cannot begin to meet the demand.

"American farmers and the Congress need to know what the total output of fertilizer will be; what tonnage will be retained in the United States; and the schedule of making such fertilizer available for domestic consumption. We need to make sure our farmers will not be dependent on government directives, or the directives of any international organizations."

Corruption never has been compulsory.

President Truman and Arthur M. Hill, Chairman of the newly established National Security Resources Board. This Board was created to coordinate civilian, industrial, and military mobilization in the event of war.

Tenant Family Improves Home

Mr. and Mrs. Jeff Cox of Clintonville Community, Macon County welcomes visitors to their home. The Coxes are renters and while they do not own any land they always make the place they live in quite livable. They don't just "stay" there.

Within the last few years the present location has been changed from a bleak, bare, eyesore into an inviting and homelike place. The owner cooperated by furnishing the materials for steps, both front and back, brick siding for thee outside and some of the labor.

Mr. Cox bought the screen for the doors and windows. Mrs. Cox ceiled the two main rooms with cardboard and papered them herself. The bedspreads, scarfs, curtains, and rugs are all homemade.

Together they devised a neat little pantry by partitioning off a long shed room. The dining room side contains shelves for the canned stuff (more than 300 quarts of it this year) such as vegetables, fruits, and meats.

The Coxes made enough eotton to take care of the rent and fertilizer bill but they get their living out of their chickens, garden, and cows. Mrs. Cox makes a hobby of of her flower yard.

Various Evergreen Plants Should Be Well Watered

By Dr. Floyd Bralliar
Garden Editor
The Nashville Tennessean

Now that winter is approaching evergreen plants of all kinds should be well watered, for if the tissue is not well filled with water, before it becomes dormant, it will suffer.

The warm days as well as the winds of winter sap considerable water from these plants, and unless they are well saturated to start with many twigs and even fair sized branches may be dried out enough to kill them. This does not show until after new growth starts in the spring, and may not show fully before the middle of the summer.

Occurs Frequently

This condition occurs very frequently in boxweed and in Arbor Vita. And may occur in almost any evergreen plant. We have had such a severe drouth over most of the South during the summer and fall that many plants have already suffered from the lack of water and this does not only apply to evergreens but to shrubs of all kinds. It is true that we have had moderate recent rains over various parts of our territory, but so far, there has not been enough properly to prepare our evergreen to enter the winter.

In our territory, evergreen shrubs and trees especially, and even most varieties of shade trees should be kept thoroughly watered for the first summer after they are set out, and it is a good idea, especially with evergreens, to soak thoroughly the soil around them about this time. Then put a mulch two or three inches deep under and around them. This mulch should extend out a little further than the hole in which the plant was set.

Hepls Hold Moisture

This not only helps hold moisture, but maintains a more even temperature on the roots, and in this way the plant is eneouraged to continue root growth all winter. It doesn't make so much difference what material is used for this mulch, except that it should be something that would not be unsightly and can be allowed to remain permanently. In this way it will gradually decay and add fertility to the soil.

In fact all mulches should serve two purposes. First, they should furnish protection to the stems and prevent rapid freezing and thawing and so prevent sun scald. Secondly, the muleh will uphold a continuous supply of water in the soil around the roots.

"Papa, why do they rope off the aisle at a wedding?"

"So the groom ean't get away."

Wheat, Raisins, Flour, Honey Friendship Cargo for France

NEW YORK —(AP)— A friendship ship. crammed with eight millions pounds of food brought from all parts of the nation on the Friendship Train, sailed for France with America's Christmas present for the people of that strife-torn nation.

Gaily bedecked with flags and with the words "Friendship cargo, USA" printed on its sides. the 10,000 - ton freighter, American Leader sailed out of New York harbor. Destination was Le Havre where the friendship ship was scheduled to arrive Dec. 15 in time for distribution throughout France before Christmas.

In the holds of the American Leader were 10.000 pounds of macaroni, raisins, tons of flour, corn, and a ton of honey.

There was $73,000 in cash which will be used to buy more food in France. And there were movies, taken along the route of the Friendship Train, showing communities turning out in masse at railroad stations to make their donations. The movies will be shown in French schools.

Twenty American volunteer relief agencies will participate in the distribution of the food in France.

There was a brief ceremony on pier 57 on the Hudson river just before the American Leader sailed yesterday.

The captain of the ship, Allan C. Smithies, was given a letter from New York's Mayer William O'Dwyer to be presented to President Vincent Auriol of France.

Ludovic Chancel, French consul-general in New York, expressed the gratitude of his nation for such a magnificent gift.

Then a band played the "Marseillaise" and the friendship ship was pulled by tugs away from the pier, sailing on the sixth anniversary of the day the U. S. entered World War II with help for a nation which has not yet recovered.

7-Point Grain Conservation Plan Set Up in Tennessee

By Robert Battle

Approximately 2,000,000 tons of grain can be saved on Tennessee farms this winter without sacrificing livestock and poultry, and in turn will be in keeping with the Tennesste Livestock Feed Committee's program, it was learned today.

A seven-point program—outlined to benefit the nation and the hungry peoples of Europe—when properly carried out can mean the conservation of food and the betterment of farms of the state.

In keeping with President Truman's request that the State Livestock Feed Committee present, and carry out, a conservation program, O. E. Van Cleave. commissioner of agriculture, today sets a platform of seven points to be followed. It is felt that the points, all good business practices, ean build up the farms of the state, and "do away with unnecessary expenses."

By rat and insect control, efficient feeding and prevention of other waste, it is believed by many that an estimated 700,000 tons of grain ean be saved.

Approximately 100,000 tons of grain can be conserved by redueed pig losses, it was pointed out. Not only does this aid in grain conservation, but to the farmer and livestock owner, it may mean additional money in his pocket.

A decrease of 30 pounds in average weight of hogs—with more profit to the farmer—some 100,000 tons of grain can be saved, it is believed.

This was also the opinion of farm leaders throughout the nation. In America as a whole, about 63.000,000 tons can be saved, and in all probalility will mean life to hundreds if it is sent overseas to he starving peoples of a war-torn world.

The culling of poultry stocks and efficient feeding of chickens and other birds can add an additional 120,000 tons to the giant store house of grain saved this winter.

Parasite Control

Parasite control and the feeding of beef cattle grain for short finish only can mean 60,000 tons of a feed put back all of which is in cooperation with the president's National Food Conservation Program.

At a recent meeting here, the committee for the state, appointed by C. E. Brehem, acting president of the University of Tennessee, and Commissioner Van Cleave, set up a nine-point program. Many of the points outlined at that time, have been adopted by various committees throughout the nation, it was reported today.

In at least eight Northern states the "eat the bread crust" point as outlined by the state group has been adopted.

Use Roughage

An increased use of roughage and pasturage, and culling by dairy farmers can add in the saving of another 100,000 tons. With roughage plentiful, more and more grain can be saved.

It is reported that this year Tennessee has a good supply of haygrasses, sorghum and other roughages.

"One rat can eat or wase 100 pounds of grain a year," it has been said. "Weevils destroy almost as much corn in the South as livestock consume. Eradication campaigns against these pests on farms would save another 4,000,000 tons for the nation as a whole," it was declared.

Lime, fertilizer, management and provision for an abundant supply of pasture throughout the season are essentials, agricultural officials have declared. A good slogan for Tennessee would be—"Save for Better Living."

Protect Hybrid Tea Roses to Avoid Winter Killing

By Dr. Floyd Bralliar
Garden Editor
The Nashville Tennessean

It is now time to protect roses for the winter. After more than 40 years with roses in Tennessee, I am convinced that it always pays to give our hybrid tea roses some winter protection. The time was when we used to make a mound 10 or 12 inches high of stable manure around each plant, but we found two reasons for abandoning this method. Fresh manure coming in direct contact with the plant is apt to injure or even kill the bark. And though manure eontaining plenty of straw that has been used for bedding does not usually injure the bark of a rose bush, it does provide a good resting place for mice and even for rabbits. And they are almost sure to eat the bark of roses and do great damage.

Nevertheless roses do need a mound of some kind around them to prevent winterkill. For this purpose I prefer cottonseed hulls when they are available. Each is better than anything else, but it should be brought in from somewhere else in order to make the mound. If we remove too much from the roots they are injured by freezing.

Straw is all right to use provided we trap all mice either before or immediately after applying the mulch. In fact it always pays to trap mice in our flower gardens this time of the year. Use the ordinary mouse trap baiting it with cheese and you will have no trouble with birds bothering it. The traps should be set out just before dark and taken up again early in the morning. Field mice are even fonder of cheese than are the house variety.

One can make a heap of leaves around eaeh plant and throw just enough dirt or something to hold it in place. It does not pay to prune roses in the fall under ordinary circumstances for they do not winterkill nearly so badly if the tops are left on. They prevent so much freezing and thawing both by shading the ground around the bush and by precenting a free eirculation of air.

If there are plenty of leaves and grass around the bush, this is usually all of the winter protection they need. It doesn't matter much whether the tops of roses die during the winter or not, provided each shoot has five or six inches of live wood at its base. Usually roses should be cut back to within 8 or 10 inehes of the ground each spring. Even cutting them back four or five inches does no harm.

Mulching Strawberries

There is one phase to profitable strawberry production which is being neglected not only by the home gardeners, but by a larger percentage of the commercial growers as well. That phase is mulching.

Mulehing is the process of covering the plants with some type of straw during the winter. This should be done sometime between the middle of December and the middle of January for the best results, so say the records.

Mulching offers many advantages. It provides protection for the plants during the colder days of winter. This allows many of the plants to go through the winter and maintain a greater percentage of the leave developed last season. Plants exposed throughout the winter will lose a greater portion of the leaves and often the buds are damaged. While protection from cold is extremely important for good yields, most growers who follow the practice recognize the fact they are able to produce a cleaner and more desirable berry.

The mulching material is applied to the berry field at the rate of about one and one-half tons per acre or some two to three inches in depth. Patches in home gardens might be covered a bit deeper, but it has been found that too much straw might prove less desirable.

The straw should at least be partly moved from the top of the row into the middle when growth starts in the spring. Enough of the material will have settled around all the plants to form a clean bed for the berries.

Berries ripening on a bed of straw will be eleaner than those allowed to ripen on the ground, especially if the rainfall is heavy during the growing season. Berries protected from the cold ground will remain far more firm and will be free from rotten spots. This is true when berries remain on the plant over a longer period of time due to cold or rainy weather.

Another advantage in mulching is that straw will hold moisture longer in case of a dry spell. Moisture is very essential to the development of desirable fruit. On the other hand it will take up moisture and dry faster than soil.

Any number of mulching materials can be used for this purpose, namely wheat, oats. and barley straw, generally accepted as the most desirable. However, such materials as low-grale hays, sorghum "pummies" or cotton hulls might be used.

Contrary to the belief of some growers, leaves, espeeially large leaves, are not desirable for this purpose. Some use them and are successful, but more caution should be taken in removing them in the spring. They have a tendency to pack down and become wet. This not only makes harvesting disagreeable, but may prove harmful to the crop of fruit. Pine needles are acceptable.

While it might be a bit early to do the work, it is not too early to make plans and to get materials ready.

Prepare Land Now for Spring Pasture and Permanent Hay

PERMANENT HAY

Most farmers have had trouble in late winter and spring when they wanted to plant sericea, permanent pastore, and kudzu seed due to the soil being too wet to plow. The best way to get around this is to prepare land now.

Congressmen Push Program to Insure Ample Fertilizer for Southern Farmers

Washington, Dec. 8—(AP)— Two Mississippi congressmen are working on a program designed to insure that southern farmers will have adequate supplies of fertilizer for their 1948 crops.

Both of them, Reps. Abernethy and Whitten, Democrats, said today they want no repetition of last year's situation when, they said, fertilizers arrived too late and in insufficient quantities to meet southern needs.

Hearings on the entire fertilizer situation are to open December 11, before a House Agriculture Subcommittee of which Abernethy is a member.

Earlier Whitten had asked the Agriculture Subcommittee of the House Appropriations Committee to look into the matter.

The subject, however, was left to the agriculture group since it investigated certain phases of the question last year.

Abernethy said he is seeking information from various government agencies and from the industry as well.

"I propose to see that Chilean nitrates are imported this year in sufficient quantities and on time," he told a reporter. "Last year the Maritime Commission didn't allot sufficient ships to bring in nitrates and thus fertilizers arrived too late to aid the mid-South."

Representatives of the Army, State and Commerce Departments, the Maritime Commission, the fertilizer industry, farm organizations and farmers themselves will be asked to testify, Abernethy said.

He added he wants information from fertilizer manufaeturers and distributors as to their "methods of allocations and quantities available, with particular reference to allocations to dealers and customers of long standing."

He said these are some of the questions he wants answered:

"At what capacity are army fertilizer plants operating?

What Army plants capable of manufacturing fertilizers are idle?

Is the Martime Commission making available all ships needed to import Chilean nitrate?

What fertilizers are being exported and to whom?

What plant foods are being manufactured abroad?

Are plants in "Marshall plan" countries who were prewar exporters of fertilizers, operating?

The matter of fertilizers, he said, is "vital" to his area.

Here's One Way To Revive Those Dying Evergreens

Evergreens that have developed dead tips on branches or are losing needles or leaves still may be saved, according to N. R. Elliott of the University of Kentucky College of Agriculture and Home Economics. This is how.

"First, loosen the soil around seach plant in a circle that will be about three feet in diameter. Dig the soil to a depth of about four to six inehes, and work it until it is in good condition. Then, if well-rotted manure is available apply about two inches to the entire cultivated area. Be sure that the manure does not come in contact with the stem of the plant.

"If you do not have aecess to either of these, just leave the soil worked but be sure that you water the plant liberally right after the working. During the winter, water the plants once a month, selecting a day when the temperture is above freezing.

"If you are unable to secure the well-rotted manure or tobacco stalk when the soil has been worked in December, apply three to five pounds of a good grade, complete fertilizer to each plant in March. During next summer all yeu will need to do is rake the cultivated area onee in a while with a steel garden rake to kill the weeds and keep the soil loose"

Farm Prices Set Records in October

Washington, Nov. 3—(UP)—The prices that farmers receive and prices they pay set all-time records in mid-October for the second straight month, according to the Agriculture Department.

The mid-October parity index of prices farmers paid rose to 289, as compared to an index of 271 for prices they received. In these indexes, 100 is the average for 1909-1914.

Prices received advanced three points above the mid-September record, as compared to a one-point advance for prices paid. As a result, the parity ratio—the relation between the two indexes—rose one point to 121.

The average price farmers received for wheat soared to an all-time high of $2.66 a bushel. This was 23 cents a bushel above the previous month's price and 10 cents a bushed higher than the previous record set in June, 1940. The price increase was attributed to continued strong demand for exportable grains and apprehension over possible effects of the Southwest drought.

Meat animal prices declined two per cent from the mid-September all-time high. Hog prices rose to a new record of $27.60 per 100 pounds in mid-October, but prices of other meat animals declined.

One Variety Cane Established in Community

"From little acorns big Oak trees grow." This is what Hosea Guice of the Millstead Community, Macon County believes.

His story dates back four years ago. He saw some C. P. 807 being made into syrup by a neighbor. This neighpor gave him three stalks of cane.

Guice put out the three stalks and got 72 stalks the first year. The second year he cut these stalks in half and put them out. He followed recommendations in fertilizing and cultivating. That fall he harvested over 2,000 stalks.

He shared these with neighbors and put out a quarter of an acre for himself. From this he made 81 gallons of syrup and sold 982 stalks to neighbors. The fourth year, which in 1947, he has one acre of this cane. Half of it is growing from roots and half from cuttings.

He will make over 200 gallons of high quality syrup and save plenty of cane to enlarge his field next year.

The story does not end there. Cane distributed by Guice in the community is being grown by ten or more of his neighbors.

Some of his neighbors will harvest more than Guice this year. This cane is popular with the Millstead farmers because it grows on tableland and stands drought.

From three stalks of cane the entire Millstead Community now receives benefits.

ON THE AGRICULTURAL FRONT

Negro Extension Workers Increased by 197 Since '45

Of the 924 addition agricultural extension workers appointed in the South through Bankhead-Flannagan funds since the 1945 fiscal year, 197 or 21 percent were colored, reports M. L. Wilson, Director of Extension Service of the U. S. Department of Agriculture.

North Carolina leads the list of States with appointment of 36 additional colored farm and home demonstration agents and supervisors; and Mississippi is second with the appointment of 31. The total number of colored Extension Service agents and supervisors stood at 790 as of June 30.

Helps Stop Erosion

Cut or disk cotton and corn stalks and other crop residues soon as harvest is over. This will help protect the soil from erosion and make land preparation easier next spring, says S. R. Doughty, API extension soil conservationist.

It's Hog Killing Time! Some Curing Recipes from Kentucky

By Mrs. Aubrey Hintton

Now that hog killing time has rolled around again we thought there might be farm page readers who would enjoy knowing how some of us in Allen County, Kentucky, cure our pork hams, can pork and make some of the most delicious sausage you have ever tasted.

Here are some of the recipes:

Mr. and Mrs. R. J. Dinwiddie's sugar curing meat method:

For one large ham: One pint salt, two tablespoons brown sugar, two tablespoons black pepper. Put in pan and mix thoroughly.

Spread large cloth (size of 1-2 shirt in which there are no holes) over a table. On this, lay a piece of meat with skin side up and rub the mixture on. Rub plenty of mixture into cut side, putting remainder of mixture on thickest part of meat.

Wrap cloth around meat, and sew so there are no holes left. Put this into a large sack, tie and hang up. Meat will keep two years.

A favorite recipe for canning meat the water bath way: Cut meat into two by two and one half inches. Pack into well sterilized quart jars. Screw lids on tightly enough to catch or as tightly as possible. Allow a sufficient amount of warm (but not hot) water up to neck of jars. Let it come to a boil. After the water begins boiling, let boil for three hours, adding water of the same temperature of that in canner when necessary so that water is kept up to necks of jars. At the end of the three hours boiling, remove from packer, tighten lids and put away.

Home seasoned sausage:

While some use commercial sausage seasoning, others prefer the following recipe for seasoning sausage. However, saltiness of salt and hotness of pepper must be considered in measurements. All measurements are to be level: To each gallon of meat, cut and ready for grinding, add 4 tablespoons salt, 2 tablespoons sage and 2 tablespoons pepper. Sprinkle salt, sage, and pepper over meat, a gallon or two at a time, either before or after grinding, which simplifies the working of sausage and saves so much guess work.

Some fry sausage and pack away in jars, others pack in jars and cold pack according to above cold pack recipe, directly after grinding, while others let sausage stay in enameled or aluminum vessels for a day or two before putting away.

Sausage that is put into sacks and rolled in flour helps close the cloth of sacks. Wrap in paper and hang. Sausage smoked by burning hickory chips is tops.

S. C. Farmer Nets $1,000 from 2 Acres Of Tomatoes

A, report on truck farming in Beaufort County, S. C., indicated that many of the colored farmers of the county received excellent returns from their tomatoes this year.

State Extension Supervisor E. N. Williams points out that although the tomato crop of a few farmers did not reach expectations. most of the crops turned out well. For example, he reports that William Simmons received a labor return of $1,000 from two acres of tomatoes, while his brother, Robert, received $800 from a simular plot.

Williams says that a good many of the tomatoes were delivered to the Negro cooperative cannery which operated at full capacity all summer. Cannery products are sold in the co-op store.

Bang's Disease Program Progresses in Tennessee

By Robert Battle

As the State Department of Agriculture's program for the control, prevention and elimination of Bang's disease in dairy and beef herds in Tennessee steps into the limelight, announcement is made of a special meeting December 18 in Lewisburg for the purpose of discussing an extensive program for Marshall County.

Long time a problem to dairymen and all other cattle raisers in the 95 counties of the state, Bang's disease has resulted in the ruining of hundreds of herds of cattle. Not only does it mean the loss of calves at birth, but frequently the disease is responsible for the death of the female animal.

Her milk production, after contracting the disease, may be decreased by as much as 75 per cent, and at times she may go completely dry, the U. S. Department of Agriculture has reported.

In an effort to rid Tennessee of the disease, and have a large number of Bang's free herd in the state, the Department of Agriculture, through Commissioner O. E. Van Cleave, has inaugurated a widespread program for the control, prevention and elimination of it in the state.

Assembly Votes Funds

The 75th General assembly last year provided funds for the expansion of the program which was, at the time, in operation on a small scale. Feeling that the program should be carried out on a community and county basis through members of the legislature voted funds to carry the program to the rural sections where it is most needed.

The new program calls for the vaccination of calves between the ages of four and eight months. The department has given a complete outline of the practice they plan to follow.

The old program of test and slaughter was carried on in the state for a period of some 13 years. If a cow showed signs of having Bang's she was immediately sent to market. This method would eliminate Bang's in the herd, but would not assure the cattle owners that their best cows would not have the disease next year.

It was a success in that Bang's disease was eliminated for the time being. The vaccination program is one which many of the state departments of agriculture has carried out over a period of years and has proven successful.

Interest Runs High

According to Commissioner Van Cleave, a number of counties have manifested interest in the program. Giles county has a set-up. Williamson, Greene and Madison have shown interest.

"It will safeguard the cattle owners from a tremendous loss," Van Cleave said. The state department will furnish the vaccine; it will furnish the veterinarian; and the service is free, he said.

The program will be carried out so that about every four months, representatives from the department will cover special sections and carry out the plan. "The way it will save both time and money, and the farmer or cattle owner can keep in touch with us as to how his herd is doing," the commissioner declared.

The average farm can be visited three or four times each year. In a few years, it is pointed out, all females in the state will be vaccinated, and Bang's disease in Tennessee can soon be done away with, he added.

Before the program went into effect, the state vaccinated an average of 1500 animals per month. "We will carry the work as far as we can with the money and manpower available," he asserted.

The laboratories of the state department are well equipped and able to carry out an extensive program, Van Cleave said.

Safety

Always be careful about the water you drink. Most farm water is contaminated. Give the farm well or spring the care and protection necessary to make it safe.

A simple test can be made by your county Health Officer to determine if your water supply is safe.

Fall Production Needed for High Profit in Eggs

From Fall until Christmas is the period that often determines whether country poultry raisers will show a profit or loss for their entire year's work.

Total egg production must be high during fall months—period of heighest egg prices, for a successful year, points out John Ivey, API extension poultryman. He gives these ideas on how to make the flock lay well:

1. Keep plenty of good quality laying mash and water before hens at all times.
2. At noon feed three pounds of laying mash moistened with buttermilk or hot water to each 100 birds.
3. If not satisfied with quality of protein in laying mash being fed, two or three pounds of 26 per cent mash pellets per 100 chickens daily will stimulate production.
4. If hens are not running out on range where green feed is available, cut and feed each day at least two pounds per 100 birds.
5. Hens that have access to yards need to be confined to the house at least until noon every day, and all day during rainy weather.
6. Plenty of deep clean litter will make the flock more comfortable and assist in producing clean eggs. Keep lice and mites down.

Woman Making Profit in Rabbits

Mrs. Mary Taylor, Boligee Community, Greene County, has found the production of tame rabbits profitable.

She took up raising rabbits after fowl pox wiped out her poultry flock.

She states, "I bought a pair of rabbits for breeding. They multiply very fast. In seven months time I sold $186 worth of breeders and meat rabbits."

Their feed consisted of chopped corn, peanuts, sweet potatoes, oats, and other green leafy vegetables produced at home. This money was used to purchase a living room suit, one War Bond, and a few needed articles for the kitchen.

These are the men who have the responsibility of coordinating for the President the civilian, industrial, and military mobilization of the country in the event of war. They are members of the newly established National Security Resources Board. Reading left to right are: Secretary of Agriculture Clinton P. Anderson, Secretary of Defense James Forrestal, Secretary of the Treasury John W. Snyder, Secretary of Commerce W. Averell Harriman, Arthur M. Hill, Chairman, Lyle Belsley, Secretary, and Secretary of Labor Lewis B. Schwellenbach. Seated, President Truman. (Because of illness, Secretary of the Interior Julius A. Krug was not present.)

The Board reports directly to the President.

WOMAN'S PAGE

Household Hints

DATE-NUT CAKE

1 cup walnuts
1 cup dates
2 tablespoons flour
2 teaspoons baking powder
½ cup sugar
2 eggs beaten

Mix as listed. Bake 30 minutes at 350 degrees in greased, floured pie pan.

As days get cooler and boiled dinners become more popular, a good big pan of steamed cornbread or quick corn lightbread is a welcomed addition. I like to make cornbread like this with a boiled dinner because it comes in so handy to pour the batter into a stemmed cake pan and steam it for an hour while the beans or turnip greens are cooking underneath. I use a fruit jar top over the top of the stem to keep too much steam from coming up and making the bread soggy. Here are the ingredients:

Steamed Cornbread

4 cups meal
1 cup flour
1 teaspoon soda (more if molasses is used)
1½ teaspoon salt
½ to 1 cup molasses, or 3 tablespoons sugar
3 cups buttermilk or enough to make batter like muffin dough

Pour into deep greased pan, cook over steam for about 1 hour and bake 45 minutes or until well done.

BREAD STUFFING

34 slices of bread
1 cup butter, or margarine
1½ cups finely chopped celery
½ cup finely chopped onion
¼ cup finely chopped parsley
2 teaspoons thyme, if desired
2 teaspoons poultry seasoning
1 teaspoon salt and ½ teaspoon pepper

Remove crusts from bread—toasted or heated in oven. Cut into small cubes. Melt butter over low heat. Add celery, onion, and parsley. Cook until soft but not browned. Add to bread with seasonings. Mix lightly with fork. This makes enough for 10 .to 12 lb turkey (drawn weight).

QUICK AND EASY

Savory stew is a popular favorite but time often does not permit serving it. For a quick stew, brown 2 cups diced cooked meat in hot lard or drippings. Add 2 tablespoons flour and a can of vegetables soup. Heat and serve on hot biscuits.

A child usually is able to draw a circle before he can draw a square.

USE FOR TRIMMINGS

The trimmings left from making a two-crust pie may be stacked together, carefully rolled out, then spread with softened butter or margarine, sprinkled with sugar and cinnamon. Cut in strips or squares and bake in a hot oven. These may be used in place of cookies in the lunch box or with a fruit dessert, or may serve as a partner for a fruit salad.

GINGERED FIGS

Wash 1 pound dried figs (light or dark) and remove stems. Add cold water to cover, together with 2 tablespoons lemon juice and 1 tablespoon thinly sliced lemon rind. Add a large piece of ginger root and cook rapidly for 20 minutes, until figs are puffed and soft. Remove figs to dish.

Pour off and measure syrup and and one-half as much sugar. Simmer until thick, then add 1 tablespoon lemon juice and 4 thin slices fresh lemon. Pour over figs, then chill and serve with cream.

It is never too early to cull out low producing animals. Culling should be practised at all times, especially in dairy and poultry production.

PINEAPPLE UPSIDE DOWN SALAD

1 envelope plain, unflavored gelatine
¼ cup cold water
¾ cup boiling water
2 tablespoons sugar
½ cup syrup drained from canned, sliced or chunk pineapple
2 tablespoons lemon juice
3 tablespoons cider vinegar
1½ cups shredded cabbage
½ cup sliced radishes
2 tablespoons diced green pepper
6-7 canned pineapple slices or 1 cup chunks.

Soften gelatine in cold water and dissolve in boiling water. Add sugar, salt, pineapple syrup or other fruit juice, lemon juice, and vinegar. Cool, For a fancy pattern on top of mold, place 2 half slices and 1 slice of pineapple (or chunks to resemble slice and a half slices) in bottom of a 5x10x3 inch loaf pan with ½ inch radish in center. Pour over this a thin layer of gelatin mixture. Chill until mixture starts to stiffen. When remainder of mixture begins to thicken, add cabbage, radishes, green pepper and remainder diced pineapple. Pour into loaf pan on top of thin layer of gelatine Chill, Unmold onto platter and garnish with salad greens. Serve with desired dressing. 6 servings.

CRANBERRY-APPLES

Heat cranberry sauce and flavor lightly with cinnamon. Use for filling cored apples and bake in usual manner.

LEMON-EGG PIE

4 egg yolks
1 cup sugar
Grated ring of 1 lemon
4 tablespoons (¼ cup) lemon juice
⅛ teaspoon salt

Blend all ingredients. Cook over simmering water, stirring constantly until thick, about 15 minutes. Remove from heat. Prepare a meringue by adding ¼ teaspoon salt to the 4 egg whites and beating to a coarse foam; then adding ½ cup sugar gradually in tablespoon portions and continuing beating until mixture is glossy and stiff. Fold yolk mixture into meringue. Pour into a baked 9-inch pie shell. Bake in moderate oven (325 degrees) until delicately browned, about 20 minutes. Serves six.

CREAMED TUNA

Make white sauce with 2 tablespoons butter or margarine, 2 tablespoons flour, 1 cup milk, 1 teaspoon salt, ½ teaspoon pepper, and 1 teaspoon onion juice. Add 1 can flaked tuna. Let heat thoroughly and serve on toast or waffles.

DATE-NUT SPREAD

1 cup pitted dates
¾ cup walnut meats
½ cup minced celery
⅛ teaspoon salt
Mayonnaise

Put pitted dates and walnuts through food choper, using fine blade. Add minced celery and salt; then add enough mayonnaise to make a spreading consistency. Mix well. Store in refrigerator until used.

THRIFTY CASSEROLE

Not enough meat left from Sunay's roast to even make hash? Fold small cubes of the meat into a casserole, sprinkle with buttered crumbs, and bake in a moderate oven about 20 minutes. Serve with buttered peas and fruit salad.

Wear aprons for little chores around house and garden and save your clothes.

Years ago when rice was sold in bulk, washing before cooking was necessary to be sure the rice was clean, but recent research has outdated this practice.

A slip that is worn at athe top can still be used as a petticoat by cutting off the top.

Try parsnips scalloped, like potatoes.

ROASTED ALMONDS

It's easy to make salted roasted almonds at home. Choose blanched or unblanched almonds, spread thinly on a shallow pan and mix with 1 teaspoon butter or salad oil per cup of nuts. Roast at 300 degrees for 25 minutes, stirring occasionally. Sprinkle liberally with salt as soon as you take them from the oven.

Sliced bacon may be left in its original wrappings or wrapped in clean waxed paper. It should always be kept in the refrigerator.

SELF-HEATING CANS

The dinner-in-a-can idea comes to fruition with the resumption of the production, by a West Coast packer, of self-heating canned foods—a project begun just before the war but stopped by tin shortage. The container consists of an outer can which holds a liquid and a chemical. When a hole is punched in the liquid compartment, the fluid and chemical produce heat that warms the contents of the inner can. Twelve minutes later a can opener applied to the inner can will reveal steaming hot hamburgers with tomato sauce and mushrooms, or beef and gravy, or an egg noodle and chicken dinner, or frankfurters and beans. Other products are hot chocolate and coffee which the can will heat in five minutes.

SNOWTIME MITTENS

Waterproof snow mittens to keep children's hands warm and dry will be introduced soon.

The new mittens have a flannel lining and an outside covering of red rubber. They will be made in three sizes—small, medium and large.

Three tablespoons of mayonnaise mixed with one tablespoon of anchovy paste makes a wonderful dressing for tomatoes and cucumbers or cold boiled artichokes.

Lamp shades with white or ivory lining give about 50 per cent more light.

When a washing machine is overloaded, the motor is under a strain and clothes may not come clean.

Dust bric-a-brac with the dusting brush which came with your vacuum cleaner; books, too, and the shelves, as well.

In general, enamelware baking pans give the deepest brown when baking products. Glass ranks next, especially in an electric oven which has a high degree of radiant heat.

For a different cranberry sauce that you'll want to repeat often, add golden raisins and a bait of candied ginger. Cook the raisins with the cranberries, sugar and water. Add the ginger and cool. Good with turkey, super with roast duck.

To make dull or tarnished gold jewelry look like new, rub it lightly until bright with a tooth brush that has been dipped first in ammonia, then in baking soda.

HOUSEHOLD HINTS

When re-stringing pearls or other beads, dip the restringing cord in a bit of nail polish. This will make the job fast and easy.

The next time you dust meat with flour before frying, try using pancack flour instead of the regular product.

Never wash your flour sifter immediately in hot water, because heat thickens the flour clinging to the sifter. First, rinse out then wash with water until all the flour has been washed out, then wash thoroughly in hot soapy water: finally, rinse again with clear, hot water and dry thoroughly.

To patch a thin curtain, cover the hole with a piece of white paper and "darn" it with sewing machine needle. When the curtain is laundered, the paper will dissolve and a neat patching job will remain.

You should never wash your best china in boiling hot water, for the heat tends to mar the glazed finish on the dishes.

Place pop corn in the refrigerator before popping it. This creates moisture and makes the corn pop better.

Melted paraffin poured over leftover paint will keep the paint in good condition for future use.

Keep a cork on the end of your scissors, and choose or trim the cork to fit your thimble.

To prevent dulling the fine, sharp edge of kitchen knives, keep them in a wall or drawer rack.

A clean soft-drink bottle with a hole punched in the cap makes an excellent clothes sprinkler.

COOKERY HINT

Herbs used in a quickly cooked dish or sauce give more deliciousness if moistened with a little milk or cooking oil and allowed to stand for half an hour before using.

A baby is born somewhere in the United States every 8:76 seconds.

DATE BARS

1½ cups sifted flour
½ cup sugar
½ teaspoon baking powder
½ cup shortening
½ teaspoon vanilla extract
1 egg, beaten
¼ cup milk

Sift together flour, sugar and baking powder. Cut or rub in shortening. Combine vanilla extract, egg and milk. Add to flour mixture. Mix well. Spread one-third of batter into greased 8x8x2 inch pan. Cover evenly with date filling. Spread with remaining batter. Bake in moderately hot oven (400 degrees) 25 to 30 minutes. When cool, cut into bars.

Date Filling

Combine ½ cup hot water, ½ cup sugar, and 1 cup chopped dates in saucepan. Cook until thick Cool. Add 2 teaspoons lemon juice.

Several slices of lemon aded to water when cooking rice will assure really white rice.

BROWN BUTTER SAUCE

Cream together and beat until light ½ cup butter or margarine, 2 teaspoons kitchen bouquet, and ¼ teaspoon salt. Use immediately or store in refrigerator until needed. Melt and use as a seasoning for cooked vegetables or as fish or meat sauce. Yield: ½ cup.

ROAST SLOWLY

The old-fashioned way to roast meat was to use a very hot oven, which resulted in excessive shrinkage. The modern way is to use a low temperature throughout. By so doing you get less shrinkage, more servings per pound, and more uniform cooking of the interior of the meat. However, the surface is apt to look pale and underdone. To overcome this disadvantage and have your meat come out of the oven with a rich brown crusty exterior, brush the surface lightly with kitchen bouquet before cooking.

STEP SAVER

The next time you are near a hardware shop or a five-and-dime, buy four casters. Have the man of your house attach them to the legs of a wornout table and presto, you have a sorting place for the household wash which can be rolled close to the household washer and just as easily moved elsewhere to hold the family ironing. If it lacks a good top, cover it with oilcloth of one of the new patent fabrics.

GARNISH FOR HAM

Cinnamon apple balls make a garnish for baked ham that will delight the eye as well as the palate. With a small ball scoop, make as many apple balls as desired. Poach them gently in a hot syrup made by melting cinnamon candies in a little water. Do only a few at a time and don't overcook.

A simple and delicious dessert for the buffet supper consists of fresh ripe pears accompanied by Camembert cheese.

CHERRY COOKIES

½ cup fat
1 package vanilla or butter-scotch pudding mix
1 egg
1 cup sifted flour
½ teaspoon soda
½ teaspoon cream of tartar
¼ teaspoon salt
1 cup uncooked oats (quick or old-fashioned)
Egg white
Sugar
Finely chopped nutmeats
Cherry preserves

Cream fat; add pudding mix gradually and cream until fluffy. Beat in egg until light. Sift together flour, soda, cream of tartar and salt. Add to creamed mixture with rolled oats, mixing, thoroughly. Form into small balls; dip in slightly-beaten egg white, roll in sugar and then in nutmeats. Place on greased baking sheet. Punch a hole in center of each cookie and fill with a preserved cherry. Bake in a moderate oven (350 degrees) 10 to 15 minutes.

Stewed roses and primroses once were popular continental desserts.

BROCCOLI WITH MUSTARD SAUCE

1 head broccoli
Salt
½ cup sugar
1 tablespoon flour
2 tablespoons dry mustard
½ cup vinegar
1 cup evaporated milk

Cut stems of broccoli to remove tough fibrous part. Wash thoroughly and arrange in a deep pan with flowers up. Add enough boiling water to cover stems; cover and cook until tender. Add salt during last five minutes of cooking. Meanwhile mix sugar, flour and mustard in top of double boiler. Stir in vinegar and then milk. Cook over boiling occasionally. Place broccoli in heated serving dish, pour mustard sauce over it.

BAKED MACARONI

¾ cup sliced onions
½ cup chopped green pepper
3 tablespoons butter or margarine
3 cups cooked macaroni
2 cans Hunts Tomato Sauce
Grated cheese
Salt and pepper to taste

Saute onions and green pepper in butter or margarine. Combine with macaroni, Hunt's Tomato Sauce and seasonings. Place in greased casserole, top with cheese, bake at 375 degrees for 30 minutes. They'll love it! A low-cost dish for a hearty meal. And Hunt's costs but a few cents!

THE MODERN FARMER

VOL. XXI. NASHVILLE, TENNESSEE, FEBRUARY 16, 1948 No. 1

NEW YORK STATE COLLEGE OF AGRICULTURE LIBRARY MAR 1 1948

THE BYRD NEST

By Rev. Bernard O. Byrd
—Guest Columnist.

SEND ME

On one of the many occasions when God wanted a man to send on a special mission, Isaiah, in response to the query: "Whom Shall I Send, etc," calls out to God saying, "Send Me." This was not a call to Isaiah to meet God for the first time: Isaiah was fully acquainted with God and had already had much dealings with Him.

If one is to be sent by the Lord, he must be fully acquainted with the Lord. The acquaintance must inform one of God's standards of righteousness that he might at all times be able to know when he is likely to cross the boundary line into satan's territory. A knowledge of God makes one know what things he might expect of God and what directions and advices one would receive from a supreme being. When one knows what to expect of God, satan cannot cross him up in his procedures.

The occasion of God's call was a revelation to Isaiah, in which he saw God in a special way. Many have dared give an untrue interpretation to the scripture in which the call came, by referring to it as the account of Isaiah's conversion. The misleading statement is in fact a calendrical statement which is meant to clarify a date of an occurance. The statement, "In the year that King Uzziah died, I saw the Lord, high and lifted up etc." has been explained as being an indication that Isaiah couldn't get straight with God until Uzziah died. The introduction to the book disproves this claim by pointing out that the contents of the book are in substance, the visions which the prophet saw during the days of Uzziah etc. thus pointing out that if they came in the days of Uzziah, God had dealings with Isaiah before Uzziah's death. Isaiah was not unaware of the things which he might face when he said unto the Lord, "Send Me."

When one says to God, "Send Me" he should be able to see things thru God's eyes. Many persons have referred to Isaiah as the "Eagle-Eyed" prophet, and often given him credit for having seen Christ a farther distance away than any of the other classified prophets, (that is, the prophets to whom special writings are attributed.) Isaiah had no keener vision than any other Major or Minor prophets: he saw in his day, which was probably farther away from the incarnation of Jesus Christ than of the succeeding prophets. The credit that is due Isaiah for his seeing, is not seeing over a long distance, but for looking thru the eyes of the Lord. God can reveal great things to the ministers of this day; and he does reveal things to the ministers of this day, but only to the ministers who are willing to make their own visions secondary to the visions of God. When a man looks through the flesh, he is hedged in by its limitations; but when he looks through the spirit, secular boundaries fade away.

"Send Me" should be said to the Lord only when the speaker is willing to be purged by His word and inspired by his spirit. The prophet Isaiah felt unequal to the task which God set before him until a live coal from the altar of God was

Extension Leader Helps Farmers Prepare For Cotton Mechanization

Farm Ownership Through Sideline Crops

P. H. Stone, left, State supervisor of Extension work with colored farmers in Georgia, and Melvin Howell, Fort Valley farmer, discuss sweetpotatoes as a sideline cash crop. Looking on is O. G. O'Neal, Statewide special agent and founder of the Georgia Ham and Egg show. By growing sideline crops such as sweetpotatoes and watermelons, Howell has succeeded in buying a 36-acre farm of his own after sharecropping cotton for 37 years. Since 1940, colored farm ownership in Georgia has increased from 10,018 to 12,352. Stone and his staff encourage farmers to buy farms, but they warn them against paying more for a farm than its long-time earning capacity justifies.—USDA Photo 9-22-47

Georgia Farmers Are Broadening Crop Programs And Stepping Up Their Output

Washington, D. C.—In line with current farming trends in the cotton South, P. H. Stone, Georgia Negro State Extension supervisor, is intensifying his program of helping colored farmers diversify and mechanize, reports the Georgia State Extension Service.

By conducting farm equipment clinics and by stepping up demonstrations in hybrid corn production, the planting of clover crops, and in the care of livestock and poultry, Stone and his staff are helping the colored farmers of Georgia to accelerate the broadening of their cropping program and the upping of their fram output.

To help increase the farmers' awareness of the need for raising more hogs and chickens, the State supervisor has promised O. S. O'Neal, founder of the Fort Valley Ham and Egg show, from county agent to State-wide special agent. As a result, county shows will be held all over the State this year.

Stone points out that an adequate staff is the key to effective extension work. Although he has succeeded in increasing his personnel from 14 agents in 1926 when he became supervisor to 76, he says that additional workers are still needed in order to serve effectively the 70,000 colored farmers in Ga. His goal is to add sufficient agents to bring the farm family caseload down at least to a maximun of 1,000 families in 20 communities per agent. This, he says, would enable agents to hold demonstrations in each community every month.

By working more intensively with the farm people, Stone believes that his staff can help more of them to participate in the State's balanced farming program.

Although Stone, who wanted to be a carpenter, got into agriculture by chance and into Extension Service by mere coincidence, he has become one of the most outstanding Extension supervisors in the South.

It was in 1910, while working his

Kentucky 4-H'ers Received Five Thousand Six Hundred Dollars For Calves

Twenty-eight Kentucky colored 4-H club boys and girls received $5,610 for 28 calves at a baby beef show held recently in Hopkinsville, according to a report received by the U. S. Department of Agriculture from the Kentucky State Extension Service.

The 28 calves—eighteen from registered Hereford herds—weighed 26,045 pounds and sold for an average price of 21.54 cents per pound.

The record kept by 4-H'er John

North Carolina Farmers Buy Purebred Calves For Better Home Milk Supply

Continuing their efforts toward a better live-at-home program, 15 North Carolina colored farmers received a shipment of purebred and high heifer calves last week, according to a report received by the U. S. Department of Agriculture from the North Carolina State Extension Service.

When the 15 calves arrived, they were purchased cooperatively by the 15 farmers who drew lots for their choices. The price of the ani-

Wake County Negro Farmer And A 4-H Club Boy, Members Of '100 Bushel Corn Club'

Raleigh, N. C.—A Wake County Negro farmer and a 4-H Club boy last week received notification that they had been accepted in one of the most exclusive clubs in the United States—the "100 Bushel Corn Club," which is restricted to those farmers and 4-H Club members who have under supervision harvested 100 or more bushels of corn on an acre of land. The demonstrations were under the supervision of W. C. Davenport, Negro County Agent of the State College Extension Service, Raleigh.

Those producing 100 bushels or more are: W. D. Pegram, 123.7 bushels Route 1 Varina; and, Robert Penix (4-H), 101.1 bushels, Route 3, Raleigh.

Five other Wake County farmers and 4-H Club members were notified of membership in the honorary organization because of their record in producing just a notch below the 100 Bushel Club. They are becoming associate members, having grown and produced over 75 bushels per acre.

The five associate members who joined the exclusive circle are: Bartel Lane, 99.3 bushels, Route 2, Raleigh; J. E. Perry 91.4 bushels, Eagle Rock, Theron Perry (4-H), 86.1 bushels, Eagle Rock; C. N. McCullers, 81.1 bushels, Route 2, Apex; and, Lonnie Wilder (4-H), 79.4 bushels, Route 3, Raleigh.

Two C's in Clothing

Dress for comfort and confidence, advised Miss Maude Wallace, in an address recently before the State Negro Advisory Board of Virginia. Miss Wallace, is Assistant Director of Extension Services in Virginia.

Anderson Tells AMA Farmers Want Sound Medical Payment Plan

Washington, D. C.—Farmers want a program for easing the payment for comperhensive medical care, so organized as to encourage early diagnosis and prevention of disease, said Secretary of Agriculture Clinton P. Anderson in an address last week before the mid-year session of the American Medical Association in Cleveland, Ohio.

After describing the contribution of the Department and of farmers to better health through research, including penicillin and DDT, and through increased production of food. Secretary Anderson pointed out that farm people are not reeeiving in health services the full benefits of their own contribution.

"Today, anemia, malnutrition, defective vision, dental caries, hernias childbirth, and all the diseases that modern medicine is most successful in controlling are more common among rural people than among those of cities. Typhoid claims three times as many rural as urban victims, diphtheria twice as many. Malaria, hookworm disease, and pellagra are problems in some rural areas," said the Secretary.

Continuing, he asserted that tuberculosis and syphilis, which have long been regarded as peculiar urban problems, are increasingly invading the countryside. "It is not surprising," he said "that the Selective Service system reported during the Second World War that farmers, as an occupational group, had a rejection rate of 53.4 pereent, as compared with an over-all rate of only 43 percent.

"This unfavorable health record of farmers may be due to several causes," said Anderson "but one cause stands out most clearly—and that is serious lack of services and facilities through which the benefits of modern medical science may become available to farm people."

Anderson pointed out that doctors are now trained essentially to practice in hospitals with complete medical facilities. Modern hospitals, laboratories, clinics and public health services are not to be found in very many rural areas. Dentists, nurses, and all other health workers also have tended to chose urban centers for practice in perference to rural communities, said the Secretary. Then he added that the only health item that farmers use more frequently than city people is patent medicines.

"Farmers need local public health units established in the 1,400 counties where they do not exist, and strengthened wherever they do exist," said the Secretary," so that programs to improve mental health, the health of mothers, infants, and the aged, and programs of rural sanitation may become more readily available to all country people."

Continuing, Secretary Anderson said that farm people want a program for easing the payment for comprehensive medical care, so organized as to encourage early diagnosis and prevention of diseases. And, they need from medical schools and medical associations more consideration to research in rural health problems and to both recruitment and training methods that will attract and hold physicians in rural areas.

Turning to prepayment programs, the Secretary said that such plans for covering the payment of surgical and other medical services offered by the State and county medical societies have today reached less than one percent of the rural people.

There are only 13 rural cooperative health services associations with general membership, according to the co-op division of the Farm Credit Administration, he declared.

"In the field of rural rehabilitation," said Anderson "Farm Security—now Farmers Home Administration—with the aid of medical societies, organized group serviee plans in more than a thousand eounties. The agency also helped improve medical services for migratory farm labor. However, reeent changes in legislative authority have saused the Department to abandon many phases of this medical care program including the organizing of groups."

Anderson concluded his talk by telling the American Medical Association that farm people want to look to the medical profession for leadership. That they want their pressing health problems solved in a sound manner consistent with democratic ideals.

Fuhr of FCA Addresses S. C. Negro Extension Agents

A. H. Fuhr, assistant to the governor of the Farm Credit Administration of the U. S. Department of Agriculture, addressed the annual conference of the colored Extension agents of South Carolina last Tuesday at State college, Orangeburg, S. C.

Fuhr, who has been engaged in professional agricultural work for more than 20 years, told the South Carlonia agents how Farm Credit aids farmers by making low-interest-rate credit available to them.

Said Fuhr, "Colored farmers must find ways of reducing their cost of production, and this includes the price they pay for credit. In encouraging increased production, I don't believe we are placing enough emphasis on per unit cost. After all, the farmer is in business to make a profit, and a profit he must make if he is to succeed."

Fuhr was for 18 years a county agent in Oklahoma, and for five years a State contact representative for the Agricultural Adjustment Agency and the Production and Marketing Administration. Last spring he came to Washington to succeed Cornelius King as assistant to the governor of FCA. Since that time he has traveled over a large part of the South, observing first hand the credit needs of colored farmers.

Anderson Says Co-ops Important to Continuance of Family-Farms

Washington, D. C. Declaring that family-size farms are competing in a world of economic giants, Secretary of Agriculture Clinton P. Anderson expressed his faith in cooperatives as a means of meeting the competition in an address delivered recently in Everett, Wash.

"We are now, and for some time we have been, confronted with a trend toward fewer and bigger farms. I regard this as inevitation to a certain extent," said Secretary Anderson. "We are becoming more efficient," he continued. "Three people can now produce more than four could produce just before the war. If we are to make the most of our new mechines and methods, we have to have more land and higher investments per worker.

"Otherwise," the Secretary added, "more and more farm people will become unemployed. But the trend toward fewer and bigger farms is not necessarily a trend away from the family-type farm. It is one thing to have family-farms growing larger and continuing to compete. It would be quite another thing if the family-farm could no longer compete but had to give way to gigantic factory-type units."

Going further, Anderson said, "I have pointed out before and I say again—because I believe this is an extremely important fact—that our family-farms are competing in a world of economic giants. The farmer buys from powerful giants; and sells to giants. How does he compete? the Secretary asked.

Co-ops, to him, was one of the answers. "I have said," he continued. "I am FOR farmer cooperatives because they serve the cause of individual free enterprise and protect the family-farm."

The Secretary also expressed himself as being in favor of the continuance of cooperatives under present laws which give them positive encouragement.

Breakfast Foods Involve Many Years of Research

By Arnold J. Pearson

Minneapolis—(AP)—The chatty breakfast food you virtually inhale in a few seconds in order to catch the 7:52 for the office might have as much as 10 years of research behind it.

The simplicity of shaking out a few kernels of flakes from a package belies the trials and even tribulations behind development of today's breakfast time-saver so the breadwinner can get off to work and the little woman can complete her chores in time for the big afternoon bridge date.

Research as extensive as that associated with highly technical scientific problems has gone into some of these cereals which virtually; speak" to you during the morning meal.

There are no hit-an-miss tactics or "pot luck" results in the big test-producing the cereals.

One household breakfast favorite has 10 years of research behind it. But all of the testing wasn't performed in the laboratory. The public itself, with its critical taste buds, took part in the development. One company, in 1931, decided it would like to market a ready-to-eat oat cereal. The first problem was selection of the proper type of grain. Market analysis supplied that answer when a survey showed that rolled oats as a porridge was one of America's oldest and favorite dishes.

How to prepare it for quick serving in the home and how to shape the individual kernels were among a host of problems. Consumer tests by the hundred were conducted. The cereal was developed first in disc form.

The vitally important problem of tests gave the proper product extensive rounds in the realm of research. Consumer acceptance tests were held on a regional basis, with sampling stations installed in various geographical sections of the nation.

Later it was decided to produce the cereal in the shape of tiny doughnuts. The new look gave it more customer appeal.

Meanwhile engineers in the mechanical division of the milling firm were busy over the drafting boards designing and testing special processing equipment, a gigantic test in itself.

The reuslt was a special "gun" in which the cereal is puffed, after being cut into the tiny doughnut shapes.

Though a product becomes a breakfast time favorite, the researchers still aren't finished. Constant changes in the public's eating habits and tastes mean testing must be continued and a new product added if advisable.

South Sees Monthly Cash Income and Steady Employment in Dairying

Plans for the development of a long-range dairy program for whites and colored farmers in 10 Southern States were formulated as part of a through-going balanced cropping system at a recent milk-production conference in Atlanta, Ga.

It was pointed out at the conference that dairying is a stable farm enterprise that provide a steady monthly cash income, as well as steady employment for farm labor throughout the year.

The conferees made plans for meeting the high demand for dairy products through the adoption of the following program: (1) Better feeding of dairy cattle year-round, (2) improved herd management, (3) abundant all-season pasturage (4) more high-quality roughage. (5) sound breeding program, (6) improved utilization of labor-saving methods and deviees, (7) increased production of quality milk and cream, and (8) more efficient farm-to-market practices.

To Get Best Results Learn Plants' Soil Requirements

By Floyd Bralliar

Garden Editor

The Nashville Tennessean

Gardeners, especially those who expect to enter our Greater Home-Freedom Gardens Contest for 1948, need to realize that the soil requirements of all vegetables are not the same.

While all vegetables can be grown in almost any soil, some prefer decidedly acid soil while others need considerable lime in their soil. The degree of acidity or alkalinity of soil is known as its pH. It is determined chemically and is measured in degrees. A soil with a pH of seven or above is alkaline while one with less than this is acid. For all practical garden purposes a soil with a pH of six, five, seven may be regarded as neutral. Liming soil raises the pH while adding sulfur or much decaying plant material lowers it. If the soil is decidedly acid soil while others need to grow on it likes a higher degree of alkalinity liming will increase the yield as well as the quality of the crop.

Hard Wood Ashes Good

Of the ordinary garden crops, except in soil that has a pH of 7 or above, asparagus, beets, celery, spinach and onions will be benefitted by the addition of lime Where it is available hard wood ashes is especially good to use on the soil. Our personal experience has been that ashes is especially good for onions and asparagus.

Under the same conditions spinach. Swiss chard, muskelons and bush lima beans are often benefited by the application of just a little ashes or a light dressing of lime. Tomatoes, cucumber, eggplant, lettuce, cabbage, cauliflower, snap beans and peas do best in soil that is very slightly acid so they do not need but would not be especially injured by the use of a little ashe of lime.

Best in Sour Soil

Most other vegetables do best in decidedly sour soil and would not yield as well if limed or given ashes. They may even be benefited by sprinkling a little sulfur in the soil under the rows. Such vegetables are usually much better grown in soil that is decidedly rich in humus (decayed or decaying vegetables matter).

These things being true, the common gardener, who grows a general family garden will do well to keep it as nearly neutral in reaction as possible by turning under something every year that will decay and form humus. On the other hand the family who plants an asparagus bed should not only lime the soil when preparing the bed but add either a little lime as a dressing or use ashes on it about every other year.

Farm Labor Declines Seasonally

About a million and a half fewer people were working on farms on December 1 than a month earlier, a usual seasonal decline. However, there was an increase in the number of hired workers in the South over a year earlier of nearly 100,000, but decrease of 34,000 in the number of family workers. As compared with the average number of family workers who were busy at work during December of the five-year period 1935-39, there were 223,000 fewer engaged in the South on December 1 of this year, but in other sections of the country, 56,000 more family workers were employed. This would seem to reflect continued under-employment of family-sized farmers in the South.

Your Grocer Works Hard

The president of a large retail food chain system released a year-end pass statement in which he said: "Nobody has worked harder than your grocer to keep costs and prices down. Fifteen years ago, when you spent a dollar in a food store, 25 to 30 cents went to cover the grocer's cost of doing business, including business, including his profit. Today these funetions in many cases are performed for as little as 15 cents. Without the efficiency which brought this about, you would be paying 10 to 15 cents more for every dollar's worth of food you buy."

He then cites a number of factors which he believes have contributed to increased efficiency, including larger stores doing a greater volume of business under one roof, direct delivery from farm to factory to store, greater emphasis on self-service, and improved training of personnel.

What is true of food is true of all other kinds of retailing, and the chain stores as well as independents have made notable contributions to this progress. High prices have occurred in spite of, not because of, retailing policy. They would be much higher still had not retailing taken some long steps forward in late years.

Declare War on Rats In Conservation Drive

War on rats in every rural community in the Nation has been declared by the U. S. Department of Agriculture to help protect food and feed supplies on farms from costly ravages.

A suggested program of action in the rat extermination campaign has been sent to all States for their use in this important phase of the farm grain conservation program.

It is estimated that there are nearly as many rates in the Uuited States as people. They eat or otherwise destroy about 200 million bushels of grain a year on the farm.

The farm rat control campaign is being sponsored jointly by the Department of Agriculture and the Fish and Wildlife Service of the U. S. Department of Interior with farm, industry, and citizen groups cooperating.

County Agent, 75 Retires after 28 Years

R. H. Brown, 75-year old colored extension agricultural agent of Sheby County, Tenn., retired on Dec. 31 after 28 years of effective service, reports W. H. Williamson, assistant state agent of Tennessee.

Although Mr. Brown is retiring, the assistant state agent expressed the hope that he would continue to serve the county staff in an advisory capacity, especially with the promotion of 4-H club work. Mr. Brown became the colored county agent of Shelby County in 1920 and has served continuously ever since. One of his main programs has been to encourage farmers to grow sideline crops along with their cotton. As a result, many farmers in the county are not only living better, eating more wholsome meals, but they also are earning a steady weekly income by selling vegetables, chickens, eggs, and other home-grown products to their neighbors in nearby Memphis. Among other things, he has stimulated a group of 4-H'ers to establish a roadside market.

Assistant State Agent Williamson says that Mr. Brown has enrolled 2,600 boys and girls in 4-H clubs. Also, he helped more than 5,000 farm families to develop a live-at-home program.

Farm Talk with Farm Folk

By Jesse Safley

Many of the recent wolf stories from Williamson and Marshall counties might be compared to a snowball rolling down hill—the further they go the bigger they get.

Farmers around Holts Corner have lost a considerable number of sheep, lambs, goats and pigs during the past few months. They are uncertain of the exact cause of the losses in most instances. Some are convinced that animals other than dogs are quilty, while others hold fast to the idea that dogs are the greatest enemy of sheep and believe they are to blame for recent loss.

We have been in the "wolf-populated" area in the past few days and have heard many stories, some of which indicate the situation is extremely serious. Upon checking the stories, it was after found some of them had been expounded considerably, while others were started just for fun.

We are in no way attempting to over shadow the seriousness of the losses farmers are suffering. At the present price of meat, anytime a farmer loses a number of sheep, it is serious, regardless of the cause. However, there is not sufficient grounds for a general alarm among livestock producers in other sections as some might believe

Farmers and residents in the area where the wolves have been reported active are getting a laugh out of the big stories they are hearing. Many of those stories originated around the stove in the village stores.

For instance, it was reported that one farmer spent the night setting in a tree watching for the intruding animals. The fact about that story was the man hid in the tree for a short time late one afternoon.

Another story typical of those being started for fun grew out of a hunt involving a few men and a half dozen dogs. Soon after the dogs were turned loose, they hit what the hunters called a "hot trail." The chase continued for some two hours. No one knew what the dogs were chasing. Suddenly, the chase ended and all but one dog reported to the hunters.

Someone remarked that the missing dog had probably been killed by a wolf. Soon the story got out that wolves had attacked the pack of dogs and had killed one and chased the others away. The story spread quickly and it was soon a general topic of conversation. It was even heard miles from where it originated.

The truth of that story was the dog which failed to return was in the habit of staying out later than the rest of the pack. Later in the day, the missing dog reurned unscratched.

There is little question but what wolves of some type have been active in the Holts Corner area, perhaps for some time. They have been responsible for at least a part of the livestock losses. However, chances are dogs and maybe foxes have contributed to the losses. Either is serious and should demand attention of farmers as well as authorities charged with the duty of assisting them.

Farmers in the area where the losses are concentrated who own sheep or other livestock which might fall prey to the bloodthirsty animals should make every effort to prevent the losses. There are numerous ways a farmer might prevent a part of the loss other than standing watch for an attack. For instance, if bells are put on approximately one-fifth of the sheep in a flock, the wild beast would be less likely to strike. Then in case there was an attack, chances are the farmer's attention would be attracted by the tinkling of the bells.

Another precaution would be to have fences so arranged that the animals being attacked could run to the barn. It is seldom that a sheep killing dog or other such destructive varmints will enter a barn for their prey. Therefore, it is advisable to pen the animals at night. Should they be disturbed, the farmer would hear the disturbance especially if a number of them were belled.

Dogs, foxes, 'possoms, wolves and other types of wild life are no doubt taking a toll of the livestock profits in this section. However, if figures were available, they would show that losses due to varmints are small compared to those caused by parasites and disease which harass livestock on practically every farm in the state.

Guns and hunters are too plentiful for wild life to ever become a serious threat to livestock production throughout the state. We cannot make such a statement about common livestock diseases which farmers encounter daily.

It is time to supply ourselves with the necessary equipment to fight those things which are endangering the progress of agriculture in the state, be it diseases, parasites, or wolves.

"Do not delay, the golden mo ments fly."

Snow Worth Thousands to State Agriculturists

By Nellie Kenyon

The reeent snows have been worth hundreds of thousands of dollars to Tennessee farmers, Agriculture Commissioner O. E. Van Cleave said yesterday.

"Most of the state's green cover crop was killed by last fall's drought," Van Cleave said, adding that had it not been for the recent snows the rest would have been killed by the heavy freezes.

"All of this means little to city folks right now," said the commissioner, "but it actually hits them right square in the pocketbook. Shortages of feeds are reflected in the price of lamb chops and the cost of ham and eggs on the breakfast table.

"The Tennesse beef cattle people are complaining," he explained, "because they have been forced to feed their cattle out of their barns. There is an extreme shortage of grain, not an abundance of hay, and the lack of green cover crops —crimson clover, rye and barley— has added to the troubles of the farmers."

The state's milk supply has been affected by these feed shortages, said the commissioner. "Right now we are having to ship milk into Nashville from other states because of a shortage of milk in this section." This shortage is partly traceable to an insufficient supply of cover crops and other feed for dairy herds, Van Cleave said.

Jersey Cattle Club to Mark 75th Birthday

The Diamond Anniversary meeting of the Tennessee Jersey Cattle Club will be held in Nashville at the Andrew Jackson Hotel next Monday and Tuesday. Matt Jennings, secretary and treasurer, announced today.

The 75th annual session of the organization will be highlighted by a talk Monday morning by Dr. A. A. McMurray, State Department of Agriculture veterinarian in charge of the mastitis control program.

Dr McMurray will speak on "1948 Program for Mastitis Control." The Dept. of Agriculture has inaugurated a full-scale program for the elimination of the disease among herds in the state. The session will be open for discussion following Dr. McMurray's talk.

Dr. C. E. Kord, state veterinarian, will discuss the control of Bang's and other diseases among diary cattle.

Another interesting feature of the meeting on Monday will be a dissussion on a constructive breeding program for Tennessee Jersey Breeders.

The discussion will be led by Lynn Copeland, district dairy specialist for Middle Tennessee. The remainder of the afternoon will be devoted to a business session and committee reports.

Anniversary Banquet

The anniversary banquet of the association is slated to be held in the dining room of the hotel at 6:30 o'clock Monday night, W. C. (Parson) Teague of Memphis will deliver the principal address.

Several awards will be presented at the banquet, and an interesting entertainment session is planned Jennings declared.

Lawrence Gardiner, director of the American Jersey Cattle Club from Memphis, will open the Tuesday morning session with an address on "The American Jersey Cattle Club's Plans for 1948" The association has a membership of over 1,000. Some 175 herds of Jersey cattle were classified in 1947.

Following the talk by Gardiner, Dr. V. L. Fuqua, state chemist, will discuss dairy feeds and the meaning of ingredient terms used.

In keeping with pasture programs for the state, R H. Lush of the University of Tennessee in Knoxville, will talk on "Save Feed with Pasture."

The session will adjourn after an address by Harold Benson of the American Dairy Association in Chicago, Ill. Benson's subject will be "All of Us, Incorporated."

To Protect Berries, Greens Put Mulch on Carefully

By Dr. Floyd Bralliar
Garden Editor
The Nashville Tennessean

Because so many gardners still believe cold weather is the thing that kills so many of their valuable plants, and destroys their late fall and winter gardens, mulches are often applied too early and too deeply.

It is not cold that kills these plants, but the constant freezing and thawing. A heavy frost or a light freeze comes in the night but just as soon as the sun comes up in the morning, if there is nothing to prevent it these leaves thaw at once, whereas if they thaw slowly or not at all, no harm will be done.

Our perennial plants and low growing shrubs as well as our garden greens and our strawberries get through the winter very much better if they are mulched. This mulch should not be put on before about the middle of January. A very light covering will prevent freezing and thawing most of the winter.

Sprinkling of Straw

In no case should the mulch be deep enough that it covers the plants so that you cannot see them plainly. A light sprinkling of straw is probably the best mulch we can apply to salad greens and strawberries. We like an inch or so of cottonseed hulls, ground peanut hulls, wheat chaff, or peat moss best for perennial flowers.

Young box woods that are set where they are exposed directly to the morning sun, should be mulched well with some one of these materials before really hard freezing weather comes. We have seen entire rows of young box woods six or eight inches high that came through the winter with the south side of the plant completely dead and the north side uninjured. Had the proper mulch been applied at the right time, the entire plant would have been uninjured.

Many Use Grass

Some experienced gardeners allow crabgrass and witch grass to grow freely in their gardens in the late fall knowing that they will both die before the first of the year, and that they make most excellent natural protection for the plants by which they grow We do not like this plan because these weeds are apt to become too thick and do more damage than good.

It may cause just a little more work, to pick greens in the winter or early spring without getting some of the mulching material mixed in with them, but their extra yields of greens will more than make up for this.

It is beneficial to mulch carrotts if they are to be left in the open ground all winter. In nine years out of ten, this is the most profitable way to keep them over winter. If a fairly heavy mulch is placed on the garden and the tops allowed to stick out a little above the mulch, they will usually keep in fairly good condition nearly all winter.

Come Up in Spring

Some plants die down to the ground every fall and come up again next spring. It is usually best to not mulch such plants at all in the South. But if they are mulched, put the mulch on lightly. For if too much is used, it is almost sure to hold moisture enough to cause the plant to rot. In other words, for plants whose tops disappear entirely in winter, a mulch of leaves or straw will do the trick.

We urge the use of straw in mulching strawberries and that it not be put on until about the middle of January. We do not put straw on the strawberry bed for protection against the cold at all, but we do put it on in order to encourage the flower stems to grow up through it and so get the berries away from the soil. Straw is sure to be clean and to stay clean, and it not only keeps the berries clean, but it prevents evaporation of moisture from the soil, so that the bed does not suffer from the lack of rain during the fruiting season.

In the early spring the mulching material should be raked off most plants and worked into the soil. It will soon decay and act both as a fertilizer and as a soil conditioner.

North of the Ohio river and east of the Rocky mountains time and method of applying a mulch differs. In this territory it is usually best not to apply mulch until the ground freezes, at least two or three inches deep Cold weather comes on much more suddenly in the North. In the Northern states we seldom have a long succession of freezings and thaws as we usually have in the South. Though freezing and thawing may be equally injurious in the North.

It is surprising how just a light covering of straw or smaller material will prevent the soil from thawing once it has been frozen.

Care must be used, however, in applying a mulch while the tops of the plants are frozen hard, lest we bruise and break them enough to cause more damage than we would have if we did not mulch them at all. This is especially true of rose bushes and woody shrubs and berry plants. But if reasonable care is used, applying the mulch need not do any harm, and it certainly will prove beneficial.

In the North we like to use stable manure as a mulch on raspberries, blackberries, and fruit trees of all kinds, this is for two reasons. First, a mulch becomes a fertilizer as soon as thawing weather arrives, and can easily be broken down into a fine mulch for summer. The second reason is that mice and other rodents do not like to nest in manure mulch, while they like to make their home in straw or grass. In fact we believe that it will always pay to trap or poison mice and other smal rodents before applying a mulch.

Level of Rural Living Rising

An improvement of about 25 percent in the leval of rural living occurred between 1940-45, says Dr. Carl Taylor of the Bureau of Agricultural Economics of the U. S. Department of Agriculture.

However, Dr. Taylor pointed out that there is still considerable disparity between the level of living in rural and urban areas. For example, in 1945 the rural areas had only one doctor for every 1,125 persons, while the cities had one doctor for every 630 persons.

The rural areas had only one dentist for every 2,860 people, says Dr. Taylor, while the city folks had one for every 1,563 persons. Only 28 percent of the rural homes had running water in 1945, as compared with 95 percent of the urban homes. Only 58 percent of the rural homes had refrigerators or iceboxes compared with 94 percent of the urban homes. For electric irons, the percentages were 93 for urban areas to 46 for rural communities.

Vast Reforestration Program Slated in State During 1948

By Robert Battle

A vast program of reforestration —including forestry management courses—is scheduled to be carried out in Tennessee during 1948—the year set for the conservation of natural resources in the state.

If the trees destroyed by forest fires in Tennessee during the past ten years could have been converted to building matreials they could have replaced every house in Memphis.

This was the recent startling estimate of Chief Forester Charles A. Gillett of the American Forest Products Industries, Inc., as that organization released as analysis of forest protection in the United States.

Based on U. S. Forest Service statistics for the 47 timber producing states, a survey of the nation shows Tennessee averaging nearly 1,900 fires and burning 84,000 of tree-growing lands annually.

With this in mind, the vocational agriculture department of the Hampshire High School in Maury County has planned a careful study of all phases of a well-rounded farm program, featuring reforestation.

The chapter has a 12-acre plot of timberland which has been leased from a farmer near the school. Here they will study the trees, and will reforest sections of the land. Some time ago they set out pine and locust seedlings numbering 2,000 in the area.

Signs along the roadways near Hampshire read: "This is a reforestation project of the Hampshire FFA Chapter."

Henry County in West Tennessee plans to carry out a full program of reforestration. An official of the extension service office in Paris said the county plans to put out several thousand young trees this year.

In the main, they will be pine and locust. Similar programs will be carried out in Lincoln County and Hardeman County.

Special courses in forestry have been inaugurated at the University of Tennessee, and a tree farming program set-up on a 70,000 acre tract near Waynesboro.

The state purchased 310 acres of land in Madison County this past year for the purpose of developing "one of the largest tree nurseries in the South."

State Conservation Commissioner Howell Buntin has explained that the nursery would be operated on a huge scale so as to provide several million trees annually. These will be made to farmers throughout the state.

The conservation department asked that all persons aid in the conserving of timber and trees. From walnuts alone last year, $1,000,000 changed hands. About $1,500,000 worth of apples were sold from apple trees. Thus trees play their part in making Tennessee into a wealthy state.

A certain Southern lady waited what her neighbors considered an indecently short length of time after the death of her husband, to marry his brother She did have the kindness to hang a picture of her departed mate in the parlor, and this somewhat mollified her friends remark she made to a stranger, —that is, until they overheard a remark she made to a stranger, who asked about the picture.

"Oh," said the rceently remarried lady, "that's my poor brother-in-law. He passed away recently.

Number of Work Animals Continues to Decline

Although prices of repair parts, gasoline, and other fuels have increased the combined average cost of operating a tractor by about 50 percent above prewar, there is a continued decline in the number of work animals on farms, says the Bureau of Agricultural Economics of the U. S. Department of Agriculture.

THE FORUM

The Modern Farmer

Published monthly by the Modern Farmer at Nashville 3, Tennessee.
Giles A. Hubert,_____ Contributing Editor
Sadie Wilson _____ Secretary
Henry Allen Boyd_____ Publisher
Office, 403 Charlotte Avenue.

Devoted to the interests of the Farmer, Truck Gardner, Livestock and Poultry, Breeder, the Home and the People.

Entered as Second Class Matter, April 10, 1929, at the Post Office at Nashville, Tenn., under act of March 3, 1879.

All contributions for publication in the Modern Farmer, should be addressed to The Modern Farmer, 403 Charlotte Avenue, Nashville 3, Tenn.

No libelous matter will be published. Unsigned articles or letters, and those written on both sides of the paper will not be used.

Subscription price $1.00 per year, 75c for six months, payable in advance. Personal checks must be certified. Make all checks or money orders payable to The Modern Farmer.

North Carolina

(Continued from page 1)

mals ranged from $85 to $103, not including transportation. Total cost of the 15 animals was $1,240. Over 1,000 head of purebred and grade heifer ealves have been purchased during the last two years by colored farmers of North Carolina.

Virginia Farmers

(Continued from page 1)

of Virginia.

The publication describes how five colored farmers have increased their income by following sound soil and water conservation practices. One of the farmers, Cade F. Nappier, the colored soil conservation champion of the State, increased his corn yield from five bushel per acre to 50 and his income from around $300 a year to $1,800 by filling in the gullies, stopping erosion, and building up the fertility of his land.

Another of the farmers listed in the bulletin is the Rev. H. B. Perry, who farms 13 acres to supplement his income from preaching. When he bought his place 10 years ago, the soil on it was too poor to grow grass. Now it produces over 50 bushels of corn per acre, enough to produce a year-round supply of pork with extra corn for feeding the cow and a horse. Also, the Perry family raises vegetables and fruits.

The other soil conservation leaders described in the bulletin are George Yates, who has strip-cropped 30 acres; Chris Clark, who now contours all of his slopes; and Lee Burrell, who has been strip-cropping and contouring since 1940.

Kentucky 4-H'ers

(Continued from page 1)

W. Johnson is typical of those kept by the other boys and girls who sold calves at the show. John bought a 420-pound calf in February for $71.40 through a loan from a local bank. At the time of the show the calf weighed 1,040 pounds, and sold for $255.61. John's prize money totalled $9. Feed, insurance, and interest on the note at the bank amounted to $56.98, leaving the youth $136.23 for his labor. John plans to fatten two calves next year.

Georgia Farmers Are

(Continued from page 1)

way through Hampton Institute, that Stone was veered from carpentry into agriculture. His father was a carpenter and he wanted to be a carpenter, but the librarian for whom he janitored for his room and board suggested that he take agriculture and so he did. Seven years later, with a diploma in one hand and a draft card in the other, Stone left Hampton and headed for a training camp in Ga.

There he met State Extension Agent Eugene A. Williams of Ga. In the Army, they became friends and Stone was soon sold on extension work. Shortly after demobilization day, he took a job under Williams as an agent.

In traveling about his county, the new agent noticed that the farm people either had no toilets at all, or those they had were shabby and unsanitary. He observed, too, that many of the people were ill with typhoid. Stone concluded that there was a relationship between the spread of typhoid and the lack of sanitary privies. So, he held a series of demonstrations on the construction of sanitary toilets, and what he had learned about carpentry from his father stood him in good stead.

The farm people and the plantation owner took to the idea; soon sanitary privies dotted Clark County, and month by month Stone found fewer of the farmers coming down with tyhpoid.

His thorough job of promoting this sanitary work attracted the attention of the State Extension Director, and five years later when Williams passed. Stone was made supervisor and 4-H Club leader. Also, the General Education Board and the Rosenwald Foundation recognized the quality of his work. The former granted him a fellowship to Hampton for further study, and a few years later sent him to the University of Connecticut where he was awarded a M. S. degree in agricultural economics.

Upon returning to Georgia, Stone saw a real challenge in 4-H work. To him, helping farm boys and girls to create a better life for themselves was a major objective. But soon he realized that he could not do a good job in the double role of working with farmers and supervising 4-H activities, so he selected one of his best agents, Alexander Hurse, and named him 4-H supervisor.

Today, there are over 33,000 colored 4-H Club boys and girls in Ga. And while Stone's major responsibility is that of helping 70,000 colored farmers to move ahead, he keeps in elose touch with 4-H work. Under construction now is a $20,000 4-H camp at Dublin. When it is completed, it will comprise a swimming pool, a recreation hall, and eight cinder block domitories.

In these boys and girls, as in his own four children, Stone sees the future crystal elear. In them, he says he is building better farmers for to-morrow—farmers who will not plow under by mechanization and the changing pattern of farming in the South, but who will join in and contribute to the advance.

The Byrd Nest

(Continued from page 1)

brought to spiritualize his soul. Immediately following, the prophet was enthused to step out for God. It is no less true of men of this day, that until the spirit of God inflames a man's life, he will be afflicted with timidity and hesitation. Although we find joy in thinking of the boldness of Isaiah in saying, "Send Me," we ourselves can find great joy in making similar answers to God's call when the Holy Spirit vitalizes our lives. "Send Me," means, I will go anywhere, anytime, to any people to do anything, when God calls me to go.

Negro Extension Agents Push Improvement of Rural Housing

Colored agricultural extension agents throughout the South are helping farmers to repair, enlarge, remodel, or rebuild their homes, according to reports received by the U. S. Department of Agriculture from State Extension Service directors.

The urgent need for rural home improvement in the South is indicated y census data which show that about three-fourth of the farmers in the South are ill housed. Most of these farmers live in homes that are over-crowded, run-down, and otherwise inadequate. Less than one farm home in 20 has in-door toilet facilities, while three out of 20 have no toilet facilities at all.

Seeking to help remedy this grave rural housing problem, extension agents are showing farmers how to repair, remodel. or rebuild their homes. The agents not only furnish floor plans for new homes, but in some communities, they also are showing farmers how to make and lay concrete blocks and how to build.

Extension workers in Alabama and Georgia have taken the lead in developing a complete blockhouse program. In Alabama, extension workers have joined with Tuskegee Institute in carrying out demonstrations in home construction with concrete blocks.

Recently in Georgia, a one-week rural housing school was held by the colored extension workers for the purpose of showing farmers, step by step, how to improve their homes. Among other things, the farmers were taught to make and lay concrete locks, set window and door frames, build and hang doors, replace window panes, cut steps and rafters, erect frame and concrete block houses, install plumbing and bathroom fixtures, and wire homes for electricity. Similar schools are being planned in other States.

Extension Service officials point out that the housing problem of the South is directly related to low-income. The lack of funds, they say, makes it extremely diffieult for the average farmers to hire all the labor and buy all the material for building his home. The best outlook for better housing in the South, say these offieals, is through the use of family labor and local materials such as sand, gravel, field stones, and rough lumber.

County agents say that by supplying most of their labor and materials, farmers with only a few hundred dollars will be able to build "Home Made Homes" as they are called in some States.

USDA Seeks to Make Animal Feed from Vegetable Waste and Potatoes

Two new research projects have been announced by the Department of Agriculture. The aim of one of the projects is to demonstrate the practicability and the type of equipment needed for large-scale production of animal feeds from vegetable waste.

The other project will evaluate commercial-scale processes for drying potatoes for feed and other non-food uses. Both projects are under the Research and Marketing Act and will be conducted under the supervision of the UNDA Eastern Regional Research Laboratory at Philadelphia where scientists of that labortory already have demonstrated on a pilot-plant scale the possibility of producing poultry and animal feeds from vegetable waste and pototoes.

USDA Stresses Importance of Written Farm Leases

Within the next few weeks thousands of white and colored tenant and share-cropper families will shift from one farm to another at a staggering cost to land-lord and tenant in farm deterioration, human erosion, and actual hauling expenses, say economists of the U. S. Department of Agriculture.

The Bureau of Agrlcultural Economics estimates that about two million new leases or verbal agreements are made every year. This is because nearly two-thirds of all farm leases and rental arrangements in this country run for only one year.

Department economists say that the length of farm leases has an important influence on the welfare of landlords, tenants and the land itself. They express the belief that all would benefit from longer-term leases of about five years or more.

In order to help farmers with their leasing arrangemnts, the Department has prepared an information folder entitled, "Your Farm Lease." In addition to carrying an axplanation of the importance of written leases, the folder also contains a sample flexible farm lease. Copies of the folder, which is Miscellaneous Publication No. 627, and copies of the lease may be obtained from your county agents your State agricultural college, or the U. S. Department of Agriculture, Washington 25, D. C.

W. Va. Negro Farm Boys and Girls Represented at Rural Youth Meet

The colored farm boys and girls of West Virginia were represented at the National Rural Youth Conference which was held recently in Bloomington, Ill. A delegation of five from West Virginia State College represented the rural colored youth of the State.

The theme of the conference was: "Helping Youth Help Themselves." The needs of rural youth as evpressed by the young people were: (1) More recreational faeilities, (2) joint meetings of rural and urban youth, (3) rural schools that are organized to meet rural needs, and (4) the services of capable leaders who have a sympathetic and youthful approach to the problems of rural youth.

The West Virgina representatives were: Misses June Gwynn, Margaret Johnson, and Catherine Eubank; and State Extension Leader L. A. Toney, and D. L. Ferguson, professor of sociology at West Virginia State.

Va. Agricultural Delegates Lead Way to Better Living

Proof of the leadership qualities of the delegates whom Virginia farmers elected to represent them at the State Advisory Board meeting is shown in the achievements which the delegates themselves have made on their own farms and in their own homes.

A summary of the attainments of the delegates, released by State Agent Ross W. Newsome, reveals that 83 of the 100 delegates own their own farms which contain 9,756 acres and are valued at $664,559. Also, the delegates are taking the lead in their communities in improving their homes and surroundings. Twenty-nine of them have running water in their homes, 22 have well equipped bathrooms, and the rest have sanitary toilets.

Mitchell to Speak at Tennessee State

John W. Mitchell, Extension Service field agent of the U. S. Department of Agriculture, was the principal speaker at an agricultural seminar at Tennessee A. and I. State College on December 17.

Mitchell, who has been in Agricultural extension work for 30 years, discussed opportunities in agriculture for trained men and women. As a field agent, Mitchell helps to supervise and coordinate extension work in 10 Southern States covering the upper tier of the South.

Will There Be a Food Shortage in the United States This Year?

A new handbook on grain conservation issued by the U. S. Department of Agriculture, answers the questions as to whether or not there will be a food shortage in the United States this year.

The handbook points out that United States civilians last year ate at an average rate of 3,400 calories daily. This was computed at the retail level and did not include waste in the home. The actual daily requirement per person is about 2,600 calories.

There is no prospect that the moderate food conservation asked of Americans this year will endanger their health. Compared with 1947, Americans in 1948 will eat more sugar, cheese, bananas, and dried fruits, but a little less of lard, sweet-potatoes, meat, chicken, and some canned fruits. Consumption of other major foods probably will not differ much from last year.

Little change in indicated from 1947 in per capita supplies of food energy, calcium, riboflavin, vitamin A, and ascorbic acid. Decrease in meat consumption will reduce slightly the available quanities of protein, iron, thiamine, and niacin.

4,600 Farm Families Approved for Insured Loans

More than 4,600 white and colored farm families have been approved for insured mortagage loans to buy farms of their own under the new program of the Farmers Home Administration, the U. S. Department of Agriculture announced this week.

During October and November, the first months of this new mortgage insurance program, 19 farm families in eight States received insured farm real estate loans. A preliminary survey indicated that approximately 1,300 private credit sources are willing to invest more than 20 million dollars in loans for purchase, development, or enlargement of farms. The applicants' chief difficulty, the survey shows, is finding satisfactory farms for sale at reasonable prices. More than 4,600 applicants already have been approved as eligible for insured loans.

The Farmers Home Administration reports that farmers borrowed $7,759,000 in direct Government loans during October. Part of the money loaned went to farmers to buy, develop, enlarge, or operate farms. About $6,095,000 went to farmers who had not previously received assistance from FHA. Fifty-three percent of this amount went to veterans.

A Kentucky Colonel always closed his eyes when he took a drink. When questioned concerning his habit, he explained: "The sight of good lickah, suh," he said, "always makes my mouth watah, suh, an' I do not like to dilute my drink, suh."

Worth Knowing

The vast amount of discussion given to the grain problem, particularly as it is related to the raising of meat animals, has resulted in some misunderstandings. For example, it is widely believed that practically all animals which go to market are heavy consumers of grain which could otherwise be used for human consumption

The fact is that 50 per cent of all meat of all kinds produced in the United States is grown without the feeding of any grain at all. In the case of cattle, more than 80 per cent of the beef produced is fed no grain. These animals are raised on roughage, grass, beet pulp and a large number of other foods not suitable for human consumption. On top of that, two-thirds of the area of the United States is in grass which would be wasted if there were no animals to consume it and convert it into meat. Lastly, when grain is fed, it is mostly corn, a standard animal feed, rather than that which is consumed largely by people.

It is evident that the grain problem cannot be properly solved by such extreme measures as the proposal to reduce our meat animal population. That would have an adverse effect on our standards of nutrition—effects which would be carried on into succeeding generations. It would reduce the fertility of the soil. It would be a blow to the farmer who receives more cash income from meat than from any other crop. It would reduce the supply of the many by-products which come from meat animals—and some of them, like insulin, are vital to the public health. We can and must conserve grain in every practical way—but must be sure that each step taken is sound and workable.

Promote Health by Installing Water Systems, Farmers Told

A safe and adequate water supply can mean the difference between healthy living and sickness.

With that thought in mind, the State Department of Agriculture and the University of Tennessee Extension Service has requested that farm families throughout the state install water systems.

"Running water in the home can mean cleanliness, comfort, health, convenience, and better living," a spokesman declared. Without an adequate safe water supply the average farm family can be considered "back in the dark ages."

While only about 12 per cent of Tennessee's farm homes now have running water, an effort is being made to encourage the installation of systems in all of the homes in the state.

The extension service has set a year's goal of 3,000 water systems.

While it is realized that many families may not be in position to install complete water systems this year, suggested steps toward getting the complete system are:

1. Providing a safe and adequate water supply.
2. Putting in kitchen sink with running water and drain.
3. Installing bath and sewage disposal system.
4. Piping water to other usage points.

In addition to suplying water for use in the farm homes, the dairies on the property will be benefited by the better systems.

Here are a few of the ways in which the dairy farms will be profited:

1. Aid in keeping the bacteria count down.
2. Aid in cleanliness of the milking vessels.
3. Supply adequate water for drinking purposes
4. Aid in cooling purposes.

A supply of clean fresh water without ice is essential to profitable milk production at this time of the year.

5 New Varieties Awarded Prizes in Vegetable Trials

By Dr. Floyd Bralliar
Garden Editor
The Nashville Tennessean

Recently I reported on the new flowers selected by All America Selections as their medal winners for 1948.

To thousands these new flowers are of interest.

Today I report on a much more important subject—the new vegetables that received All America selections honors. This year they are of special value to us of the South, for all of the winners are not only suited to our climate, but are vegetables we like.

Five new varieties earned their bronze medals in the 20 All America selections vegetable trial grounds scattered over the United States and southern Canada. Paragold, the deeper yellow of wax bush beans scored highest of all the contestants. It is outstanding for its clean golden yellow pods heavy yield, uniforminty of type, and earliness of bearing. The unusually richly colored pods are clean, long, slender, round, stringless, fiberless, tender, and brittle. The bushes are a little over a foot tall and are resistant to common bead mosaic. They are ready to pick about 58 days after planting. Their eating quality is excellent. The dry beans are white with a light brown shading at the eye.

A green pod push snap bean, Ranger, is especially recommended for its flavor. It is usually vigorous and is a very heavy yielder. It has white seeds and is excellent as a dry bean as well as a snap bean. The green pods are tender, round, nearly straight, and stringless. The vines show some short runners but need no support. Pods are largely borne in the crown of the plant which means easy picking.

Truly this year was a bean year. The third variety, a green podded snap bean is outstanding for heavy bearing. Combined with a very high staple quality. It is called Super Green. Its long, slender, round, green pods are crisp and brittle without the suggestion of a string. It is highly recommended to replace the popular varieties Tender Green and Stringless Green Pods. It should help hold down food costs of our own gardening in 1948.

The other two medal winners are both garden peas. Victory Freezer pea introduced the new modern type because of its unusual hardiness to hot and cold weather. It was bred to get the high quality of Thomas Laxton, in a pea that would not shed its skin when frozen or canned.

Ideal for Home Garden

It was bred rather for the home garden than for market gardeners, though it will be a boon to them. This pea is of delicious flavor and quality and is ready to pick in about 64 days after planting. The vines grow a little over two feet long, are dark green and are medium heavy. The blunt three to three and a half inch pods are borne in pairs, instead of singly. It is a wrinkled pea.

The other pea, Freezonian has about the same breeding and qualities as victory Freezer, but the vines are about two and a half feet long and it may be a little more productive and the peas are a little sweeter. It also has a clinging skin that remains intact in freezing and canning.

New Bush Lima

A new bush lima bean received honorable mention. Peerless bush lima is a heavier cropper of somewhat larger beans than the old Henderson variety. The individual beans are thick like Baby Fordhook and are fully equal in flavor to the old Fordhook, the standard of lima bean quality. Clusters of these larger pods, near the base of the plant, contain an average of three green shell beans, uniformly about two thirds as large as those of Fordhook and are like it in shape and relative thickness. The ripe beans are greenish white and are slightly wrinkled. The yield is heavier than the old varieties, and the eating quality is unexcelled.

Excel is a new extra early yellow Bermuda onion recommended only for the South and West, those states where Bermuda onions do well. It is 10 days earlier and is more uniform in shape color and flavor than the old type.

Cherokee is a wax-podded bush snapbean, a golden yellow counterpart of Stringless Black Valentine bean. Its hardiness, vigorous, upright plants bearing medium early, prolific, uniformly long, straight and meaty, oval pods of good quality make it deserve a wide planting. Its pods are held up off the ground, especially important in wax beans for cleanliness and market appearance. Cherokee should prove an important market variety.

Burley Marts Resume Sales

Middle Tennessee burley tobacco markets resumed auctions, yesterday, with Carthage leading by recording a price average of $53.41 a hundredweight for the day.

The Carthage price average is believed to be a new day's record for that market.

Sales on the Carthage market totaled 180,882 pounds for $96,614.54.

The Hartsville market sold 204,636 pounds for $104,008.58, an average of $50.83.

Fayetteville Market

Sales on the Fayetteville market totaled 150,162 pounds for $76,355.29, an average of $500.84.

Franklin sales amounted to 169,680 pounds for $84,768.36, an average of $49.96.

Gallatin sold 211,112 pounds for $104,191.20, an average of $49.50.

Clarksville sales totaled 167,680 pounds for $77,069.87, an average of $45.56.

Columbia sold 229,294 pounds for $112,097.76, an average of $48.89.

Springfield Total

Springfield sales totaled 175,018 pounds for $82,119.87 an average of $46.92.

In Kentucky, Bowling Green sold 229,760 pounds for $111,091.68, an average of $48.35, and Hopkinsville sold 258,874 pounds for $111,317.42, an average of $43.

On the dark-fired tobacco markets, which are holding their first week of auctions, a total of 204,574 pounds wassold at Clarksville for $64,585.43, an average of $31.57; a total of 127,378 pounds was sold at Springfield for $38,291.24, an average of $30.06, and Hopkinsville, Ky., sold 86,748 pounds for $26,058.08, an average of $30.37.

Better Rural Living Main Goal of Negro Farmers

While Negro farmers, like the other farmers of the Nation, are continuing to push production to help meet the food and fiber needs at home and abroad, their main emphasis is now on the attainment of better rural living, says Extension Service of the U. S. Department of Agriculture.

The new trend is indicated by the types of assistance farmers asked of Extension Service last year. Among other things, they wanted guidance in farm and home planning, home remodeling, soil conservation, and in ways of improving their health, recreational, and educational facilities. Farm women wanted more aid in planning balanced meals and in making use of modern food prescrvation facilities such as community freezer lockers.

This expanded service to farmers has called for increased extension personnel which has been made possible under the Bankhead-Flannagan Act. The $8,5000.000 increase in extension funds under this act during the last two years provided for the employment of 2,113 additional extension workers throughout the country. Of these additional workers, 924 were appointed in the South. New colored extension workers number 197, or 21.4 percent of the total increase in the South.

Never Allow Roots to Freeze When Setting Out Trees

By Dr. Floyd Bralliar
Garden Editor

Apparently more fruit trees are being planted in Nashville and vicinity now than is usual. The weather is beginning to get colder and I want to caution those handling all trees being set at this season.

Never allow the roots of trees to freeze before planting. Should they freeze keep them when they are in a frozen condition. It seems to do even the hardiest of roots much damage to be frozen when exposed to the air, and it surely injures them to handle them while they are in a frozen condition. Fruit trees usually come with their roots packed in moist packing material and they should never be unpacked until ready to set in the ground.

Never allow the direct sunlight to fall on the unprotected roots of any tree for more than a few moments. Roots were never intended to be exposed either to direct sunlight or to the wind. Keep the roots of the tree well covered with wet material of some kind while setting the orchard, and only take them out one at a time when ready to set them.

These precautions mean good vigorous growth and practically no failures. We know expert orchardists who stand their fruit trees in a barrel of water immediately on unpacking them and they leave them there until they are ready to set in the open ground. Then only a dozen or so of the trees are carried to the field at one time and they have the roots in water in a large bucket.

Trees may live even though we disregard these suggestions, but they usually make a weak growth the first year and many of them never make any growth at all until the second year.

Room for One More

A fundamental characteristic of the competitive economic system is that there is always room for one more—the door to opportunity is never closed, and the new man and the new company are perfectly free to take business away from the established concern if they can.

What this means is that, over the years, the trend is away from concentrations of economic power—and away from anything resembling monopoly.

The often-maligned iol industry provides an interesting example of this trend. In 1904, a group of companies under common ownership and management accounted for 84.2 per cent of all the crude run to stills in the United States. By contrast, in 1946, no single oil operation accounted for more than 11 per cent of the run. In those intervening years, hundreds of companies grew up and earned, through service to the public, their share of the business. And some of the biggest present-day oil companies didn't even exist at the turn of the century.

This would have been utterly impossible under a system which permitted either governmental monopoly or private monoply. In much of the rest of the world, cartels of one kind or another, which are virtually a form of government in business, have really closed the door to opportunity and have strangled competition. Those cartels sometimes go to amazing lengths—as, for instance, in limiting the number of soft drink stands that can be operated in a given area. The result is a static economy, the death of initiative, and a low standard of living. Only a competitive ecomony can save a nation from that.

Cotton Production

All 11,694,000 bale cotton crop is estimated for this year by the Bureau of Agricultural Economics of the U. S. Department of Agriculture. This is 189,000 bales above the November 1 forecast.

Arizona Council Joins International Council

Grand Rapids, Mich., Feb. 13—The Arizona Council of Churches this afternoon became a member of the International Council of Religious Education as a part of the two-day business session of the International Council being held at the Pantlind Hotel.

Representing the Arizona Council was its executive secretary, Rev. O. G. Herbrecht, of the Phoenix headquarters. Welcoming the new member into the group of 659 agencies that cooperate through the International Council were the following: Dr. Arlo Ayres Brown, Madison, N. J., chairman; Dr. Luther Wesley Smith, Philadelphia, chairman of the board of trustees; Dr. Reuben H. Mueller, Dayton, Ohio, chairman of the committee on constituent membership; and Dr. Roy G. Ross, general secretary.

Dr. Fred G. Holmes, retired physician of Phoenix and president of the Arizona council, was unable to be present.

Mr. Herbrecht, who was for 25 years director of youth work for the Iowa council, said today that the new connection of the Arizona council would "give the church members and leaders of the state a much broader vision of belonging to a national, interdenominational movement. This is much needed in a state with a large transient population and with scattered social and racial groups separated by large distances."

At present, the Congregational, Methodist, Presbyterian, Disciple, and Episcopal churches of Arizona are cooperating officially in the state council. Some of their ministers and denominational executives are giving volunteer service in assisting Mr. Herbrecht.

Among their projects are an annual rural life congress in cooperation with the University of Arizona, and a campaign to force revision of the state's marriage laws.

Denominational Publishers Act

Grand Rapids, Mich., Feb. 13.—Denominational church publishers took steps to form a new trade association during the annual meeting of the International Council of Religious Education, it was announced today.

To be known as the Protestant Church-owned Publishing Association, it will be comparable to the American Book Publishers Council, trade organization for general book publishers. The Association was initiated by the Publishers' Section of the International Council.

The purpose of the new association will be to "consider all matters of mutual interest affecting the official Protestant church-owned publishing houses." Especially important will be trade relations and legislative developments, such as postal regulations.

An executive secretary will be employed and offices will be established in the near future. The publishers appointed a committee to work during the coming year to develop the newly approved organization.

Although the new association was approved here and amendments to the constitution and by-laws of the Publishers' Section ratified, final action will await another vote at next year's annual meeting. The publishers, however, said they would begin operations soon.

Membership will be open to official publishing houses in United States and Canada. The 38 members of the Publishers' Section of the International Council will be charter members.

Committees of the new association will operate in the folowing areas: legislative, exhibits, trade relations, publishing, periodical, and visual aids equipment

A committee will consider relationships with city, county, state, and provincial councils of churches and religious education, of which there are 659 in the United States and Canada.

Local AMVETS Post Urges Congress To Build Hospital Here

The AMVETS, a newly organized group of veterans of World War II are apparently in favor of erecting a veteran's hospital "for Negroes" here. The AMVETS, like the older veterans organizations, have both colored and white posts. Mose J. Davie, popular young veteran who saw considerable service overseas, is commander of the recently organized post of AMVETS. It is Post No. 18.

Commander Davie is sponsor of a resolution which sets forth his organization's approval of a vetcrans hospital in connection with Meharry Medical College, stating that this will be a better place for a Negro Vcterans Hospital than the birthplace of Booker T. Washington in Rocky Mount, Va.

This idea of Meharry being a better place for the hospital than the Virginia site was first proposed by Dr. Murray Brown of the faculty of Meharry who went to Washington and laid claim for Meharry.

The claim being advanced for the Meharry site, both by Dr. Brown and in the resolution sponsored by Commander Davie, is that the hospital at the Booker T. Washington home is "desirable but impractical by reason of that location being incapable of furnishing hospital specialists to staff such an institution."

It happens that the bill for the hospital for the Booker T. Washington birthplace alrcady has passed the House of Representatives and is up for considcration in the Senate. Many persons are fearful that the net result of the tug of war between the two locations may result in neither getting the hospital, because the senators are under terrific pressure to refuse sanction to building any "Negro" Vetcrans Hospitals, at all. Northern Republicans dominate the committee having the hospital matter under consideration. The pressure against building any "Negro" Veterans Hospitals is being put on by Northern constituents of the senators in charge of the measure.

A New Look In Religion

(Abstract of address prepared by Dr. Will W. Orr, pastor of Westminster United Presbyterian Church, Des Moines, Ia., to be delivered Monday, Feb. 9, at a joint session of the 17 sections of the International Council of Religious Education during its 26th annual meeting at Grand Rapids, Mich.)

Chicago, Ill.—Twice in the memory of most of us we have seen the nations fly at each others' throats. Killing became big business. Survival depended on proficiency in killing. He lived longest who killed quickest. The nations that have survived are those that became master-killers. The survivors didn't start the killing. They put a stop to it by becoming better and quicker killers. Untold millions who might have been alive tonight are dead beeause of these two wars.

The Church of Jesus Christ is related to this situation. The Church didn't manufacture the situation. Yet neither did the Church prevent it. "That was not the business of the Church!" Well, maybe it wasn't; yet, maybe it was. I do not know that John and Charles Wesley would have said, "It is our business to prevent a revolution in England"; but, the historian (Green) years later said that is exaetly what those men did There is a relationship between this sick world and the Church.

Wars and strife and heartache come because there just isn't enough goodness in the world to prevent them; even as sickness takes a man because he hasn't enough white corpuscles available to attack the disease germs. Wasn't it something like this that Jesus was getting at when He talked about the "salt of the earth"? The whole lump of soeiety was to be seasoned by a people whose tart goodness just somehow influenced others.

Wars and strife and heartache come when goodness goes out—when the salt has lost its savor. And keeping a fresh and constant supply of goodness flowing is the business of the Church. Whatever the Church has been; whatever the Church has done; it has not been enough.

I am not saying the Church has failed. Never in the history of the world has the Church so many successes to which she could point with pride. The reading of the minutes of any denomination's yearly Assembly leaves one amazed at the breadth and depth of the Church's activity. The church is busy, and successfully busy! But, every now and then comes a doubt about whether or not we have put first things first. Are we busy in the King's business . . or just busy "here and there"?

Nothing short of goodness in huge quantities could heal the hurt so evidcnt in our World.

Yet, unless something not now evident in the Church comes to pass, the future appears a bit gloomy. I am not forgetting the post-war programs set up by nearly every denomination. Had all met their goals in full it would have been an amount about the equivalent of the cost of a modern battleship; hardly enough to secure a cordial hearing for the Church and her message of love and redemption. We prayed and talked about the amounts in our denominational official boards. We prayed some more and raised the goal. We committed our prayed-over plans to our people and we've worked valiantly to raise the money. It seems now the **battleship** will be reducod to at least a cruiser, perhaps even a destroyer. Not so in your denomination? Well, I am genuinely glad. It is true in two denominations with which I am familiar. "Too much vision on the part of our denominational leader?" No, never! They were guided, and guided aright. Then where lay the difficulty?

The problem isn't at the top level of our denominations. The men who have reached those top levels have had to be "producers" to be chosen and eleeted to their offices. The problem lies in the grass roots. The Church needs a good grassfire. The original dynamite of the Holy Spirit has dwindled until in many places it resembles the deafening roar made by striking a safety match. Brethren, that early Church was a producer. It attracted producers. It did things! In three countries it moved from a little fear-ridden group of defeated men to a world-wide power and influence.

Now what to do about the situation? I do not have all the answer. But, I beiieve I know who does, and that is the next best thing. There is a Man whose story is told in a Book And, those who sit in simple faith before that Book and follow that Man around through its pages are going to come away with healing in their own hearts—and enough to spare. The world is hurt—terribly hurt. It is bleeding profusely. Some believe the time is near to perform the last rite. Time does seem to be running out. The night will come "when no man can work." If anyone has the oil of goodness, let him apply it generously and quickly.

Well, it's **there, in** The Book. Look at it again. Compare it with your ten best sermons. Will any sentence you ever turned outlive you? We have too long been a party to the division and defeat of Protestanism with our tongue-in-cheek attitude toward the Word of God We deny tradition as the basis of authority, and rightly so. We shall be right when we eome in humility before the Book of Ages and let its quiet, peace and power sweep through our minds into the world about us. Twelve expository sermons, true to the text and context dealing with the deepest issues of Life, could transform a man and a congregation.

Because we have so largely lost the Book, we have lost the Man. In some recent book—I have forgotten which—this line occurs, "A man is only half himself; his friends are the other half . . . " I know when Paul was all himself his name was Saul. The newness that came over him, making him the master producer, I believe he expressed, 'I live, yet not I, Christ liveth in me." There'll be no substitute for that **"other half"** of Paul.

Knoxville Citizens Fight To Get Park Near Fort Loudon

Knoxville, Tcnn.—Colored citizens of Knoxville and Knox County have gone into Chancery Court here with intervening petition by which they hopc to defeat an effort to deprive them of leasing 90 acres of land fronting on Fort London Lake, about 14 miles from Knoxville, and to be used as a recreational center.

White petitioners are seeking by injunction to prevent the Knox Count judges from signing a lease for the land. They contend that the recreation grounds would be used to "conduct all manner of instrumentalities, merry-go rounds, ferris wheels, together with stores and shops in which food of various kinds and character would be sold." And that such an establishment would seriously damage residential property.

The petition of colored citizens charges that the white persons are seeking to block the lease because "said area and facilities will be used primarily by members of the Negro race." Knoxvillians signing the petition are among leading colored citizens of the city and include Charles W. Cansler, Mrs. W. D. S. Bradley, Clabe Claiborne, Mrs. Inez McAdoo, Robert Cooper, Isaac Hardin and Limon P. Bacon, Jr.

These colored petitioners charge that if they are deprived of the facilities for the recreational grounds as a result of the injunction, that will be in violation of the 14th Amendment to the Constitution. They have pointed out that "there is no place in Knox County where members of the Negro race can use and enjoy recreational benefits and facilities of a kind comparable to any that are provided on the lakes in the Tennessee Valley Resevoir." They say issurance of the injunction will be an act "by a governmental ageney of the State of Tennessee and will be against the public policy of the United States and United Nations."

The petitioners are represented by Attorney Carl A. Cowan, colorcd, a member of the Knox County Court and also chairman of the legal redress committee of the NAACP.

'The Knox County Court approved the proposal for the park last July. The fight to get for colored people of Knoxville recreational facilities equal to what TVA gives whites has been waged for five years.

A. and T. Alumni Organized Chapter in Raleigh

Raleigh, N. C. —Alumni of A. and T. College, located in the Raleigh and Wake County area met at the Bloodworth Street YMCA recently and orgainzed a local ehapter, in keeping with the movement throughout the state. Permanent officers werc elected and plans made for a program of operation.

Officers are: W. C. Davenport, president; C. H. McLendon, vice-president; Annie Mae Wharton, recording secretary; Mrs. A. B. Alston, assistant recording seeretary; Dr. R. M. Bell, financial secretary; J. T. Locke, treasurer; E. E. Evans, reporter; O. L. Privette, sergeant-at-arms; and, Rev. M. M. Williams, chaplain.

The regular monthly meeting dates have been set for the fourth Monday night in eaeh month.

FARM INCOME

Cash receipts from farm marketings this year is estimated at 30 billion dollars.

Lincoln, Mo. Dean Of Journalism Gets Year Leave To Study

Jefferson City, Mo, February 6, 1948—Armistead S. Pride, dean of the Lincoln University (Mo.) School of Journalism, has been given a leave of absence by the University Board of Curators to accept a fellowship granted recently by the American Counell of Learned Societies for study and researeh. Dean Pride begins his period of work at Northwestern University, April 1.

Interpretation and analyses of data assembled during the past year relating to the Negro press will engage Mr. Pride during the coming months. His proposed study emanates from his activities in connection with the Negro Newspaper Microfilming Project, which he directed in 1946-1947 for the Committee on Negro Studies of the American Council of Learned Societies.

The microfilming project brought together on 35-millimeter film more than a hundred thousand pages of Negro newspapers published during the 19th century. The positive microcopies are available for purchase from theh Photo-duplication Service of the Library of Congress, Washington, D. C., either in individual reels or in sets, which sell for $1,000 00 each.

The investigations attendant upin the assembly of the newspapers for photo reproduction developed a list of more than 2,000 Negro newspapers that have appeared in the United States since 1827. The list, together with technical and historical data, will be published this year by the Council.

Highlights Of The International Council

Some of the Major Accomplishments of the Twenty-sixth Convention Which Closed on February 14, 1948

Grand Rapids, Mieh.—Appointment of a Committee on Religious and Public Education and authorization of research and discussion of this subject were among the significant actions taken during the 26th annual meeting of the International Council of Religoius Education, which met here Feb. 8-14.

The meeting also highlighted the role of laymen in Christian education, heard many outstanding speakers, received important reports, elected officers and staff members, and carried on its other business.

Seventeen sections of the Council met during the first three days of the week. Major Council eommittees, the Commission on Educational Program and Board of Trustees also met in addition to the governing body itself on the last two days of the week In all, some 1,100 educators representing the 40 denominations and 659 councils of churches and religious edueation which cooperate with the Council attended the sessions.

Dean Luther A. Weigle, long-time leader in religious education and the Council's work, will head the Committee on Religion and Publie Edueation. Thirty prominent churchmen will serve on the committee in working out principles for relating religion and public schools without violating separation of church and state. Aetive committee work will begin soon.

Other significant actions include:

(1) Ratification of important changes in the constitution and by-laws of the Council which among other things restate the purpose and functions of the Council and allow for greater representation of laymen from constituent denominations and eouncils of churches.

(2) Provision for a Department of English Bible in the Council, which will advise other departments and committees on the use of the Bible in lesson and program materials and will continue promotion of the Revised Standard Version.

(3) Establishment of a joint bureau of architecture by the International Couneil and the Home Missions Council of North America, part of the functions of the bureau being to advise churches in erecting buildings for religious education activities.

(4) Provision for a larger role of church school superintendents in the annual meetings of the Council.

(5) Ratification of constitutional measures by the Publishers Section of the Council whereby a Protestant Church-owned Publishing Association will be organized. Although final approval must await a second vote next year, this new trade association will begin operation in the coming year

The role of laymen in Christian education was dramatized in an All-Council Fellowship Luncheon held Tuesday noon, Feb. 10. Robert Garrett, Baltimore churchman, was given the fifth annual Russell Colgate Distinguished Service Citation.

Probably the most talked about address of the week was given at this luncheon by the first layman of the Presbyterian Church, U. S. A., Wilbur La Roe, Jr., who is moderator of the church. He said that although only the church can safeguard the future of humanity and that although ministers are more important than generals, the work of the church will fail unless laymen are active in its redemptive mission.

In addition to the by-law providing greater lay representation in the Council, a study was authorized for the coming year which would suggest a plan for broader participation of laymen and women in Council policy and program making. Further action is planned at next year's annual meeting

Among other outstanding speakers heard during the seven days were Dr. O. Frederick Nolde, director of the Commission of the Churches on International Affairs; Dr. Kenneth I. Brown, president of Denison University; Dr. Charles W. Gilkey, former dean of Rockefeller Chapel, University of Chicago; and Dr. W. W. Orr, Des Moines, Iowa, pastor. Scores of other speakers were heard in section meetings

Prominent in the discussions of the week were educational evangelism, weekday religious education, Christian family life, and use of the Bible in teaching.

Heading the list of reports was that of Dr. Roy G. Ross, general secretary of the International Council, in which he reviewed the work of the Council and proposed new lines of cooperative activity in Christian education.

Dr. Ross announced participation of the International Council in the Protestant Radio Commission, which will be organized March 17. He proposed to the Council a 1948 budget of $616,625.55, which is the highest in Council history.

A report on early plans for the World Sunday School Convention to be held in North America in 1950 was heard. It was indieated that among the purposes for the conference were the following (1) "to make an impact upon the general public" and (2) "to develop an ecumenical consciousness in the interest of Christian education."

The world convention program will inelude conferences for laymen and women, for young people, seminars for professional religious workers, and mass meetings

Elected to be chairman of the Council was Dr. Paul Calvin Payne, general secretary of the Board of Christian Education, Presbyterian Church, U. S. A. He succeeds Dr. Arlo Ayres Brown, who had served for nine years.

Dr. Ross was appointed to another four-year term as general secretary, having now completed twelve years.

Rev. H. H [illegible]s, executive secretary of the Iowa Inter-Church Council since 1945, was elected to be director of edueational evangelism for the Council. He will succeed Dr. Harry C. Munro, who had resigned from the Council.

The Arizona Council of Churches was received as the thirty-third state council member of the International Council.

We have not two hearts—one for the animals, the other for man. In the cruelty toward the former and the eruelty toward the latter there is no other differenee than in the vietim.

—Lamartine

Prices Favorable as Crop Averages Above Last Year

Dark tobacco growers in Tennessee and Kentucky last week learned the answer to the question that had been utmost in their minds had been uppermost in their minds for the past several months—what will tobacco sell for this time?

As the chant of auctioneers echoed through the warehouse on opening day at Clarksville, Springfield and Hopkinsville, Ky., the answer was a little higher than last year.

However, the market is not as steady as it might appear. This is true because approximately 50 per cent of the crop is going into what the farmers call "the pool," which means that the Eastern Dark Fired Tobacco Growers Association is taking more of the crop at support price than ever before. This was verified by a representative of the association today.

"The reason for the association having to take such a large part of the tobacco is because the foreign tobacco market is so uncertain," he explained

Foreign demands for tobacco are as great or even greater than in previous years, but the lack of credit is the bottle-neck, he said.

The market is a few cents higher because the support price has been increased. The percentage going to the association is only about one fourth more than last year when 40 per cent of all dark tobacco sold went at support price. Forty per cent, however, was an unusually large take for the association. It is believed that within a short time conditions will change and tobacco companies will take a greater portion of the crop.

Meanwhile, many farmers continue to bring tobacco that is not properly sorted to the market. L. S. Morton, supervisor of demonstration and educational work with the Federal Grading Service, estimated that 75 per cent of all growers could improve the grades of their crop through better sorting of the leaves when preparing it for market, thereby increasing their net profits.

Each basket of tobacco is graded by a federal grader prior to sale. A floor price has been established for each grade and the warehouse manager starts the baskets, at that price When the price is not raised it goes to the association. Morton explained that growers in many instances have two or more colors of leaves in the same basket. A basket is often lowered one or more grades for that reason.

"We had gone a long ways in impressing upon growers the value of care in preparing a crop for market when the war began. The shortage of farm help, coupled with the fact most any kind of tobacco would sell at a desirable price, caused growers to become lax again," Morton said.

That condition prevailed all through the war years In 1945, it became noticeable that buyers were more cautious in their bidding. There was some improvement made the following year and the crop this year is much improved in that respect, but there is much yet to be done, Morton declared.

R. Harold Bell another member of the federal grading and demonstration staff, said that proper classing of a crop had paid dividends for at least one grower in Robertson County.

H. T. Osborne sold one basket this year at 50 cents per pound while his top sale last season was only 38 cents per pound. About the same price difference prevailed on down the line resulting in almost a $200 net increase for his crop this year.

Osborne said his tobacco this year was no better than last. In fact he thought he had a short crop during the growing season. Osborne contributed his increased income to the fact he followed the adivce of Bell and carefully sorted the individual leaves.

A well-lighted, comfortable stripping room is needed on every tobacco farm. Bell said. While approximately 30 per cent of the dark tobacco growers have a desirable room for this purpose the remaining 70 per cent labor under unfavorable conditions.

The weather to date this season has not been desirable for stripping because the leaves would not come in order. Graders cautioned farmers against the use of water to get thier crop in working conditions as grades are sometimes lowered by water

Why work hard for many months and then reduce your income through carelessness at the end the graders ask.

Sulfa and Our Animal Population

"Sulfa drugs overshadowed by the spectacular achievements of penicillin are showing a dramatic comeback in the animal kingdom," writes Sydney B. Self, a staff correspondent of the Wall Street Journal.

Varieties of sulfa, he goes on, are leading a resurgence in veterinary medicine and managing to hold their own in treating humans too. Diseases of both beast and fowl respond to the drug. And—though the city dweller may not realize it—animals suffer not only from diseases confineed to their kind, but from such human ailments as colds, ful, and pneumonia.

Mr. Self's description of the economic importance of curbing animal diseases is revaling. Losses in the Chicago stockyards alone run to $5,000,000 a year. Farmers spend some $125,000,000 anually for veterinary service—yet their losses from a single animal disease, dairy cow mastitis, have totaled as much as $100,000,000 in a twelvemonth.

A form of sulfa suited to combating the most serious diseases of chicken is now on sale, and other forms for four-footed beasts will soon be avaiable. It is expected that stockyards, farms, the government and various organizations will spend enormous sums to cure disease. The effect on the nation's food supply will be beneficial in the extreme. It should give impetus to the efforts of agriculture and the packers to produce and process sufficient meat to balance today's vast demand.

Dr. L. Foster Wood A Sponsor

Chicago—Protestants are urged to join Catholics and Jews in the observance of the sixth National Family Week May 2-9 by Dr. L. Foster Wood, chairman of the Intercouncil Committee on Christian Family Life, which is sponsoring this annual observance for Protestants.

"The purpose of Family Week is to challenge our American people to create homes which will be a blessing to the men, women, and children in them," Dr. Wood said in his announcement of plans for Family Week. "Such homes will provide a firm foundation for our national life."

The Intercouncil Committee represents the family life interests and programs of the Federal Council of the Churches of Christ in America, the International Council of Religious Education, and the United Council of Church Women It joins with representatives of the Jewish and Catholic faiths in sponsoring Family Week.

For Protestants, the theme of Family Week will be "Christ the Center of Home Life." Pastors and church leaders can obtain materials for celebrating Family Week from national denominational and interdenominational offices.

"Family Week features our greatest institution, the home," said Dr. Wood, who is secretary of the Commission on Marriage and the Home for the Federal Council. 'Our happiness, our emotional security, and the well-being and guidance of our children depend on it. If our homes succeed, everything else has greater value. If they fail, nothing can make up for the loss. Wreckage of homes is now accumulating too fast. When our homes are wrecked, we are a part of the wreckage."

Farm Prices in Tennessee, Nation Hit Dizzy Heights

Farm product prices in Tennessee and the nation are climbing with gathering speed, figures released yesterday by the federal and state departments of agriculture show.

The general index of Tennessee's farm products Dec. 15 set an altime record high of 312 per cent of the prices during the period August 1909—July, 1914, on which the index is based, according to a report from the department of agriculture statistical service.

The index was 33 percentage points above the previous high of 279 on Oct. 15, only two months earlier, and 37 percentage points above the Dec. 15, 1946, index of 275.

Most Items Contribute

Nearly all items contributed to the record high average, the service said. Only a few items including butter butterfat, chickens, horses and mules, sold at lower prices than a year earlier.

The sharpest differences were reported for such items as wheat, corn, cotton lint, cottonseed, tobacco, hogs, cattle, veal, calves, lambs, eggs and milch cows.

Tennessee's index jumped well ahead of the national average, which also broke all previous records, jumping five per cent during the month to 301 per cent of the 1909-14 average. This was four per cent above the previous high of 289 last October.

Farmers Well Off

Farmers were well off, compared to the rest of the nation. The level of prices paid by farmers, including interest and taxes, was only 245 per cent of the 1910-14 average. But this also was a new record breaking the record set the previous month for the tenth time during 1947

In most recent months, the service said, increases in prices of some commodities have been offset by decreases in others, to some extent. But in the month Nov. 15-Dec.15 all average prices increased except fruit, with the result that the overall increase was the sharpest since March, 1947. Fruit prices in mid-December were 29 per cent lower than a year previously.

DON'T BE A STATISTIC

Why be a statistic? In 1948, as in the past, a report will record the number of people who died by fire. If there was a fire goddess who could demand 10,000 lives a year to appease her apetite, the slaughter would me no greater than the present toll, although nations would fight wars to prevent it.

Start the New Year right by resolving that you will not be just another statistic at the end of the year. Clean out all the rubbish, rags and flammable materials from cellar to attic, in your home. Check your automobile and buildings for faulty wiring—garages are often part of the house

There are now more uses for power and heat than in the days of the open hearth—lamps, electric irons, toasters, heaters, stoves, electric trains, electric clocks, etc All of them are potential fire starters and should have periodic inspections. Smoking in bed, dry cleaning in the home, curtains by the stove, and countless other things are fire hazards. In each case the individual is responsible for cutting down the fire loss.

Unless these every day items are given greater attention by each and every one of us, the statistisicians may include your names among those who lives were lost in fires during the coming year. Be vigilant and you won't be a statistic.

If we stick to our knitting, keep our own economy right side up, explain frankly and fully what we are doing, and act with determination, we can safely leave the hollering to Molotov nd Vishinsky.—The Saturday Evening Post

Colored Farmer Wins 3rd Prize in North Carolina Contest

John Troy, a colored farmer of North Carlonia, won third prize in a Better Farming for Better Living contest which was conducted last year in Columbus county, according to a report received by the U. S. Department of Agriculture from the North Carlonia State Extension Service.

The contest was judged on the basis of diversification, increased yields, home and farm improvements, number of vegetables grown in the home garden, and the amount of food preserved. Troy was the only colored contest winner.

MOST FOR YOUR MONEY

A number of executives of leading chain store systems have recently issued forecasts of the state of retail business during the coming year. The concensue is that sales volume will remain at or near current high levels. And, of great importance to the consumer, they believe that competition among stores of all kinds will be extremely keen, and that the percentage of profit earned on each dollar of sales will be very low—lower than under OPA or in the immediate prewar years.

This is indicative of the kind of service retailing is giving the American people in the most serious inflationary period we have ever known. The savings according to consumers cannot be tabulated, but they obviously run to enormous sums. Time after time stores have pared already modest profit margins in order to prevent price increases or to minimize them. They have sought every means of reducing overhead cost and eliminating waste—again, in the interest of selling at the lowest possible price. As a result, part of the very steep increases in wholesale prices, wages and other basic costs have not reached the ultimate consumer. They have been absorbed by aggressively competitive retailing.

It would be folly for anyone to anticipate the trend of prices now. Many capable and sincere economistss began forecasting price drops and a decline in public purchasing power a year or more ago—and they were 100 per cent wrong. Only time can tell whether we are near the limit of our own inflation. But, come what may, retailing in all its branches can be trusted to give the consumer as much for his money as it can and still remain in business.

Crop Production

Total crop production this year is only a little below the average of the best five years in the Nation's history, reports the U. S. Department of Agriculture.

Only in 1942, '44, and '46 was the total outturn larger than this year. Over 348 million acres of the 52 principal crops were harvested in 1947. This is one percent larger than the acres harvested last year and, with the exception of 1944, is the largest since the 1928-32 period.

Retiring Chairman Of International Council Honored For Long Service

Grand Rapids, Mich.—Representatives of 40 Protestant denominations and 659 councils of religious education cooperating in the International Council of Religious Education honored the Council's retiring chairman, Dr. Arlo Ayres Brown, president of Drew University, at a dinner here on February 13. He has been a member of the Council since it was organized in 1922.

The recognition program was part of the Council's two-day annual business session. Participating were Dr. Edward D. Grant, Presterian Church, U. S. A., Philadel- Va.; Dr. Robert M. Hopkins, Golden Rule Foundation, New York; Dr. Walter D. Howell and Dr. Park Hays Miller, both of the Presbyterian Church, U. S. A., Philadelphia, Pa.; Dean Luther A Weigle, Yale Divinity School, New Haven, Conn.; and Dr. Roy G. Ross, Chicago, Ill., general secretary of the International Council.

Dr. Paul Calvin Payne, Philadelphia, general secretary, Board of Christian Education, Presbyterian Church, U. S. A., was elected to succeed Dr Brown during the annual meeting.

The son of a Methodsit minister, Dr. Brown was born in Sunbeam, Ill., in 1883. He received an A. B. degree from Northwestern University and a B. D. degree from Drew Theological Seminary. He pioneered in religious education during 1909-11 when he worked with informal groups in outlining the first graded lessons for intermediates and seniors. In 1914 he wrote one of the early series of graded lessons for 16-year-olds under the title, "Studies in Christian Living."

That was the year he became superintendent of teacher training for the Board of Sunday Schools of the Methodist Episcopal Church, a position he retained until 1921. During those years he was active on joint committees of the Sunday School Council of Evangelical Denominations and the International Sunday School Association. He was active in promoting the merger of the two organizations into the International Council of Religious Education in 1922. He became a member of the new organization's committee on education.

From 1927 to 1931 Dr. Brown was chairman of the Council's Committee on the Religious Education of Youth. He served as chairman of the program committee for the International Council convention held in Birmingham in 1926 and for the one held in Toronto in 1930.

From 1921 to 1929 Dr. Brown was president of the University of Shattanooga, leaving that position to become president of Drew University. Best known among his writing is "A History of Religious Education in Recent Times," published in 1924.

Dr. Brown went to Palestine in 1912-13 as agent for the Board of Missions of the Methodist Episcopal Church to oversee Methodist property in Jerusalem. In 1931-32 he was a member of the appraisal commission, Laymen's Foreign Mission Inquiry, that visited missions in India, China, and Japan.

Reviewing the growth of the International Council since 1922, Dr. Brown called 'one of the most significant things" in his lifetime the "increasing effectiveness of cooperation in Christian education."

Dr. Brown is retiring in June from Drew University after 19 years of service and expects to spend considerable time in the future in writing.

Children Want a Practical Religion, Says Christian Writer

Grand Rapids, Mich., Feb. 9.—Children today want their religion practical, said Mrs. Frances Dunlap Heron, Homewood, Ill., in speaking before religious leaders in children's work who are attending the 26th annual meeting of the International Council of Religious Education.

"Boys and girls who read adult magazines, discuss the United Nations, and listen to radio serials cannot be satisfied with mercly a Bible story on Sunday morning," said Mrs Heron, who is home editor of the Christian Advocate.

"These modern boys and girls demand Sunday school teachers and lesson materials that give them the reasons for religious faith and l.. ing.

I believe that the time will come when a gentleman found amusing himself with a gun will feel as compromised as he does now when found amusing himself with a whip at the expense of a child or an old lame horse covered with sores. Sport, like murder, is a bloody business; and the sportsmen will not always be able to outface that fact as they do at present.

WOMAN'S PAGE

Tips to the Homemaker

Ironing Can Be Simple

Ironing is a part of the homemaker's trade. We all know that the trades have "trade secrets." The secrets are the result of long hours of practice, seasoned with an interest in the job. Use the following suggestions as your secrets in ironing:

Ironing boards that are too heavy bumpy, narrow, or low cause fatigue. Buy or make ironing boards that may be adjusted from 32 to 36 inches in height. The board should be 20 inches wide.

The pad needs to be soft and resilient; the coverd taut and clean.

All or part of your ironing should be done sitting down. The height of the chair or stool should be adjusted to the height of the board.

Light coming from the left side (for a right-handed woman) eliminates shadows and eye strain

Starched clothes are easier to iron.

When hanging clothes to dry, be sure that as few wrinkles as possible are in them. This makes hand ironing easier.

Too much dampness means more hours of ironing. Experiment and find the degree of dampness that is "just right."

Ironing pads, pressing mits, and smal sleeve boards used in ironing curved seams, darts, shoulders, sleeve tops, upper section of trousers, pockets, and plackets are aids that save time and make clothes look neater.

Turn the garment as little as possible. Iron straight with the thread of the material and remember that ironing until fabric is dry is a real secret.

A Dessert that speaks of the goodness of Christmas is found in English trifle cake.

ENGLISH TRIFLE CAKE

1 sunshine or angle food cake
1 1-2 cups custard
1-4 cup wine
1-2 cup jam or jelly
1 cup chopped almonds
Whipped cream
1 can sliced pineapple

Bake sunshine or angel food cake. Allow to cool. (Do this a day in advance.) Make 1 1-2 cups custard flavored with 1-4 cup wine. Slice cake through the center, making three layers. Arrange first layer on large plate. Moisten with pineapple juice. Spread with jam or jelly, custard, pineapple wedges and chopped almonds. Place another layer of cake on top of this and repeat. When the third layer is placed on moisten with pineapple juice, using in all one can sliced pineapple, 1-2 cup jam or jelly and 1 cup chopped almonds. Place in refrigerator and chill for several hours. When ready to serve, frost the cake with whipped cream. Garnish with pineapple, cherry and almond wedges.

And if you have leftover mincemeat, here is a recipe for mincemeat bread.

MINCEMEAT BREAD

2 1-2 cups sifted enriched flour
3 tsp. baking powder
1-2 tsp. salt
1-4 cup shortening
1-2 cup brown sugar
2 eggs, beaten
1 cup moist mincemeat
1-2 cup milk

Sift together flour, baking powder and salt. Cream together shortening and sugar. Add eggs and mincemeat. Add flour mixture to creamed mixture alternately with milk. Stir until well blended. Bake in greased loaf pan in moderate oven (350 degrees F.) one hour. Yield: one loaf.

FRUIT MUFFINS

2 tablespoons shortening
1-2 cup sugar
1 egg
1 cup whole wheat flakes
1 cup buttermilk
1 1-2 cups sifted flour
1 1-4 teaspoon baking powder
1-2 teaspoon soda
1-2 teaspoon salt
1 cup chopped dates

Blend shortening and sugar thoroughly; add egg and beat well. Add cereal and milk. Sift flour with baking powder, soda, and salt. Add to first mixture with dates and stir only until flour disappears. Fill greased muffin pans two-thirds full. Bake in moderately hot oven (400 degrees) about 25 minutes. Yield 12 muffins.

Immediately after receiving a box of cut flowers, cut stems and place them in water.

DUST FROM COAT

Keep dust out of your fur coat by going over it with a blower tool of the vacuum cleaner, just being sure to keep it at the right distance to deliver only a helpful not-too-strong breeze.

USE PICKLE JUICE

The pickle juice left from a bottle of sweet pickles may be used a number of ways: to thin mayonnaise, in salads or added to the syrup for homemade chutney.

PRALINES

Cook 2 cups sugar 1-2 cup unsulphured molasses add 1-4 cup water together to 240 degrees F. or until a small amount of syrup forms a soft ball in cold water. Remove from heat and beat until creamy. Add 1 teaspoon vanilla and 1 cup pecans. Drop by spoonful onto waxed paper to form wafers. Yield: 1 1-4 pounds.

JELLIED YAMS

Scrub 2 or 3 sweet potatoes and boil in their jackets until almost tender. Drain, and as soon as cool enough to handle, peel and cut in halves or thick slices. While potatoes are cooking, make a syrup by boiling for five minutes one cup of apple jelly or cherry preserves with 1-2 cup of water and 2 tablespoons of butter. Gently cook potato slices or halves in syrup, turning occasionally, until syrup is thick and potatoes are glazed. Sprinkle with chopped walnuts or pecans, if desired.

Who Says Men Can't Cook!

If you don't think cooking is fun just look at the smiles on the faces of these boys at the Stanton High School in Jacksonville, Fla., who are taking the school's regular course in cooking for boys. They not only learn how to cook, but also steep themselves in knowledge of food planning, preparation, purchasing and serving on a family basis. Moreover, they learn to cook well enough to make a career of it. In the photograph above they are learning to make biscuits with dry skimmed milk to get around the high cost of milk Photo shows, left to right Rufus Butler, Earnest Williams and Earnest Jamerson.

For breakfast, a holiday treat will be found in Austrian fruit bread.

Austrian Fruit Bread

1 lb. prunes
1 lb figs
1 lb dates
2 pkgs. yeast, compressed or dry granular
4 1-2 cups sifted enriched flour
1-4 cup currants
1-4 cup raisins
1-4 cup split almonds
1 tbsp. chopped candied citron
1 tsbp. chopped candied lemon peel
1 tbsp. chopped candied orange peel
1-4 tsp. cloves
1-4 tsp. cinnamon
2 tbsp. melted shortening

Soak prunes and figs overnight in just enough water to cover. Add dates and cook gently in same water 20 minutes. Remove fruit from cooking liquid, and reduce liquid to 3-4 cup. When cooled to lukewarm, add crumbled yeast and two cups flour. Beat well. Cover and let rise in warm place until light and bubbly. Remove seeds from prunes and dates. Add figs and chop. Add all fruits and shortening to yeast mixture. Add spices and remaining flour to form stiff dough. Kneed until smooth and satiny. Cover and let rise until doubled in bulk. Punch down and Shape each portion into a ball. divide into three equal portions. Cover and let rest 10 minutes. Shape each portion into oval loaf. Brush with milk and sprinkle with split almonds. Let rise again until doubled in bulk. Bake in moderate oven (375 degrees F.) one hour. Yield: One triple loaf or three single loaves.

TENDERLOIN WITH TOMATO SAUCE

Cut pork tenderloin into individual servings. Season with salt and pepper. Brown well in 3 tablespoons hot fat. Add 1 cup tomato soup cover, and simmer 35 minutes over low heat. Remove meat from the pan and place in a hot serving dish. Thicken gravy with 2 tablespoons flour mixed with 2 tablespoons water to make a smooth paste. (There should be 1 cup liquid. Water may be added to make this amount.) Bring to boiling point, add 1 teaspoon lemon juice and pour over meat.

WINTER SALAD

1 cup diced celery
1 cup diced apples
1-2 cup nut meats
1 tablespoon lemon juice
3-4 cup mayonnaise or boiled dressing
1 cup date rings

Select firm, tart apples; peel or not, as desired, and dice celery and lemon juice. If the salad dressing is too thick, thin with a little cream Add to the celery-nut-mixture. Remove seeds from dates and with shcissors or sharp knife cut dates in rings. Add these to the mixture last. Serve in lettuce cups, 6 servings.

FOR MEATLESS DAYS

With meatless days, you no doubt have been searching recipes for suggestions for the main dish. Dried beans and peas are nutritionally about the same as meat. Try making your favoritc meat loaf with dried beans instead of meat. Served with a hot tomato sauce, you'll find this a tasty and nutritious dish. Meatless days may mean that you nced to make your meat supply go further.

FAT RASCALS

Fat Rascals, a name to intrigue young and old alike, are nothing more than frankfurts baked in biscuit dough blankets. Roll plain biscuit dough 1-8 inch thick, cut into pieces 3 by 4 inches. If desired, spread dough with prepared mustard. Wrap each piece of dough around a "hot dog." Bake on a cookie sheet in a hot oven (450 degrees) about 15 minutes. Serve hot.

SALAD TIP

When using beets in salads, wait until just before serving to mix the beets with the other ingredients. If the beets stand long, they will pass their red color on to anything that is close by. For an especially good beet salad add chopped hard-boiled egg. Beets with grated cheese make another good combination.

MINCE MEAT

2 lbs. beef
1 lb. suet
3 lbs. apples
2 tbsp. grated orange rind
Juice 2 oranges
Juice 1 lemon
1 pt. cider
2 lbs. raisins
1 lb. currants
1-2 lb. citron or watermelon preserves
2 lbs. brown sugar
1 tbsp. cinnamon
1 tsp. cloves
2 tsp. nutmeg

Grind meat, suet, apples and citron through food chopper using a coarse knifc. Add remaining ingredients and allow to stand one hour. Turn into large cooker and cook six or eight hours on low heat, stirring occasionally, or cook in a shallow pan in oven. Fill clean jars and seal if it is to be kept for any length of time.

But there are other delicious pies suitable to the season, and during December let me urge you to serve, at one time or another, raisin, sweet potato custard and sweet potato pies.

RAISIN PIE

2 cups raisins
1 tbsp. butter
2 tbsp. flour
3-4 cup sugar
2 tbsp. vinegar
2 cups chopped apples
1-4 tsp. cinnamon
1 cup water

Cook raisins, flour, sugar, vinegar and water together. Cool. Add apples, cinnamon, and butter. Line oven-proof glass pan with pastry. Fill with filling. Cover with pastry. Crimp edges and bake.

Sweet Potato Custard

1 cup boiled and mashed potatoes
1-2 cup cream
2 egg yolks
1-2 cup sugar
A little nutmeg

Beat yolks light with sugar. Add cream to potatoes. Combine the two; add nutmeg; place in pastry and bake. Make meringue; run in oven and brown.

Sweet Potato Pie

3 medium-sized potatoes
1 cup sugar
1 tsp. each cinnamon and nutmeg
2 tbsp. butter
3-4 cup water
1-2 tsp. salt

Boil potatoes; when cool, slice. Line pan with pastry; bake slightly but not brown or done. Make syrup of other ingredients. Place in bottom of pastry a layer of sliced potatoes; pour part of syrup over potatoes; add another layer of potatoes and cover with remaining syrup. Top may be covered with pastry or left uncovered. Bake in a quick oven; serve hot, plain or with sauce.

—The Nashville Tennessean Magazine, December 7, 1947

GRIDDLE TEST

Have the griddle hot and ready when your hungry morning shift comes in for breakfast. It will be just right for baking if a few drops of water sprinkled on dance about —too hot if the drops go up in a hiss of steam—too cool if they just float.

TANGY SALAD

Cooked beets, chilled to icy cold and cut into slices, make a very fine salad ingredient. Arrange sliced beets on a bed of endive, sprinkle with finely chopped green onions, chopped parsley and wedges of ripe olives. Serve with French dressing.

MENU TALK

In making menus it is wise to have something crisp to go along with softer foods in the same way bland foods should be combined with a spicier addition.

Refrigerator Cookie Roll

1 cup shortening
1-2 cup sugar
3-4 cup dark or light corn syrup
1 teaspoon vanilla
2 eggs beaten
4 1-2 cups sifted flour
1 teaspoon salt
1 teaspoon baking powder

Cream shortening and sugar; beat in syrup flavoring and eggs. Stir in flour sifted with baking powder and salt. Shape into two rolls about 2 1-2 inches in diameter and chill in refrigerator several hours. Slice and make into tree shapes as described.

Fig Filling

1 1-2 cups dried figs
1 cup cold water
3-4 cup corn syrup
1 teaspoon grated lemon rind
1-4 cup sugar
2 tablespoons flour
Few grains salt
1 tablespoon lemon juice
1-2 cup chopped walnuts

Cover dried figs with boiling water and let stand 10 minutes, drain clip off stems and cut fine, using scissors. Add cold water and cook until tender—about 10 minutes. Add corn syrup and grated lemon rind and cook a few minutes longer. Mix sugar, flour and salt, add all at once and cook, stirring, until thickened and clear. Remove from heat, add lemon juice and nuts, and cool before using. Makes about 2 cups fillling. Spread on cookie trees as directed above. Should there be any left over, use it for jam.

Avoid warping aluminum pans by not pouring cold water into a hot pan, by not having high heat under pan for a long time and by not allowing a pan to boil dry.

THE MODERN FARMER

VOL. XXI. NASHVILLE, TENNESSEE, MARCH 15, 1948 No. 2

Farm Prosperity And Problems Summarized In Sec'y Anderson's Annual Report

Crop production near the wartime peak and livestock production only moderately below that level in combination with prices come 20 percent above those of the previous year gave the farmers of the United States unexampled prosperity in 1947, says Secretary of Agriculture, Clinton P. Anderson, in his annual report released today. Under ordinary peace-time conditions, the report says, the agricultural situation that prevailed during the year would have been as favorable as any on record. Cash receipts from farm marketings, the highest on record, amounted to nearly 30 billion dollars. Farmers assets in land, buildings, livestock, equipment, and savings were at the highest level on record; and the equity of farm operators in the agricultural plant or the value of assets not offset by debts was up 113 percent from 1940. Farm debt, though slightly greater than in 1946, was relatively low. Nevertheless, the farmers, Secretary Anderson declares, could not take a wholly optimistic view of their position because the export demand of the years immediately ahead will depend so largely upon American financing.

Secretary Anderson says that because agriculture abroad will eventually recover from the damage inflicted on it by the war, farmers in this country need assurance, not yet available, of permanently high domestic employment along with a large commercially financed export trade. Secretary Anderson says agriculture can have these necessities only through a national economic policy that will maintain abundance in every phase of our economic life. He says farmers do not worry about minor fluctuations, in business activity but fear the possibility of a depression such as followed World War I. Without making any forecast, he emphasizes a difference between the national response we made then to the world situation and the response we are making now. " I believe, says the Secretary, "that if we continue in our present course, which keeps us in rather than takes us out of the world economy, we shall find it easier to avoid a major depression and consequently to avoid agricultural programs of the type we found essential in the 1930's."

Especially favorable for agriculture, according to Secretary Anderson, is the government's effort to revive normal world trade, the part it has taken in the establishment of the International Monetary Fund and the International Bank for Reconstruction and Development, the part it is playing in world-food relief, and the loans and other assistance it is making directly to war-damaged foreign economies. "If we continue to fill our place in the world economy, instead of pulling out of it as we did 30 years ago, the chance of avoiding a major depression will be better." As a practical approach to the problem of enabling other nations to pay for what they ob-

Texas Farmers Helping In Production Of Cucumbers

APR 15 1948 DEPT OF AGRICULTURE

Raising Level Of Farm Living Main Goal of Extension Service

Raising the level of rural living more nearly in line with urban standards is now the main goal of Extension work with colored farm people, says John W. Mitchell, Negro Extension Service field agent of the U. S. Department of Agriculture.

The first step in the drive toward better living on the farm, says Mitchell, has been the upping of the farmer's real income through increased production of crops for market and the maintenance of a live-at-home program.

For over 30 years, county farm and home demonstration agents have been showing farm people how to grow larger crops and how to produce a larger part of their own food supply. "We have done a pretty good job putting these messages across. says Field Agent Mitchell, "but we have not always made it clear that the real objective of increased production is better living

"Too often a farmer buys a new plow when he ought to repair his old one and use the extra money to screen his doors and windows or buy a new kitchen stove," Mitchell asserts. Also, he points out that more farmers ought to repair their homes and install modern conveniences.

However, says Mitchell, increasingly Extension farm and home agents are shifting their emphasis from production for increased income to prouction for better living. In line with this program of spelling out the fundamental objective of better farming, agents now conduct frequent tours of farms which not only demonstrate the benefits of following modern farming practices, but which also show the benefits of better living. In addition to the tours, housing short-courses and home-improvement clinics also are held.

Typical of the farms included in these tours is that of Mr. and Mrs. J. Richard Thompson of Hewlett, Va., about 50 miles northwest of Richmond. The Thompson home is an attractive, modern two-story dwelling, equipped with hot and cold runing water and bathroom facilities.

The Thompsons bought their

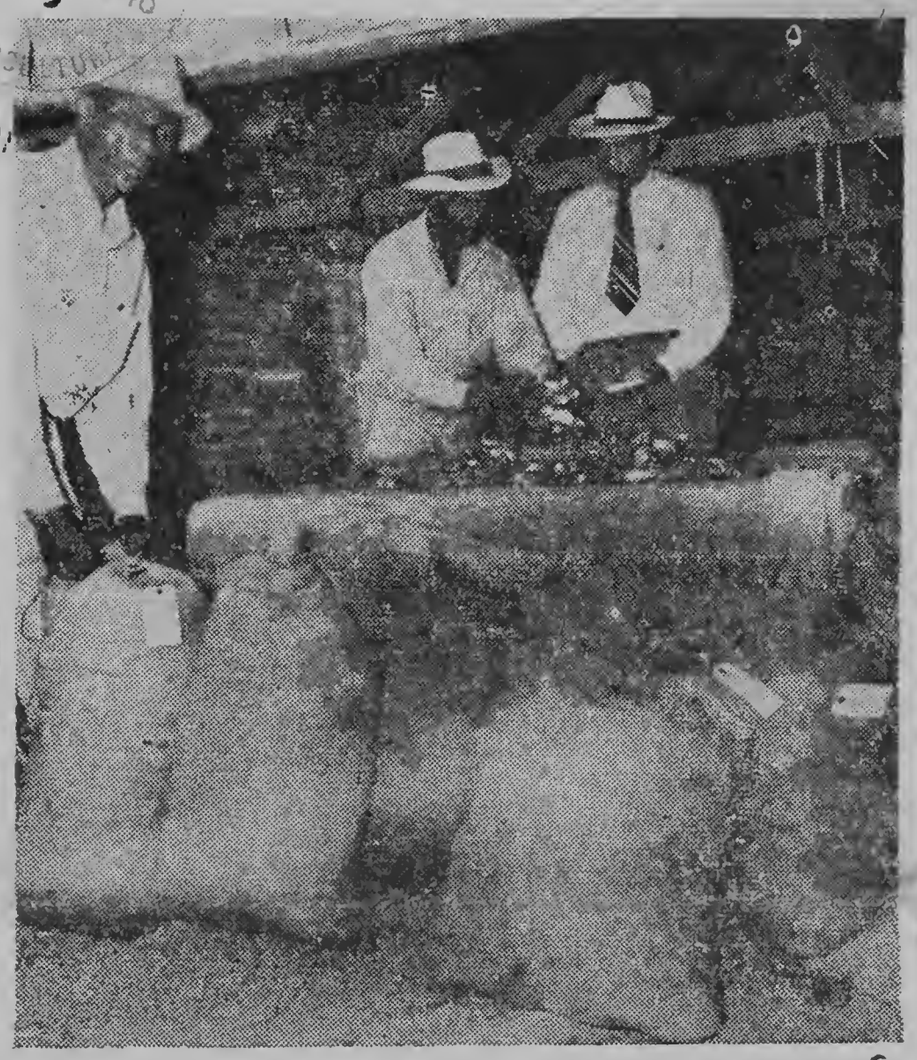
Ready For Pickle Factory



After being graded, weighed, and bagged, the cucumbers are ready for shipment to a Houston, Texas, pickle factory. Eighty colored farmers in and around Hempstead, Texas, are growing cucumbers under contract arrangements with the factory.

Left to right are: John H. Singleton, farmer and owner of the grading shed, George W. White, cucumber farmer, and H. S. Estelle, District Extension agent, who has helped the farmers increase their cucumber production. The cucumbers shown on the table are in process of being graded. USDA Photo—9-15-47.

W. C. David, State Leader, Gives Encouraging Report For 10 Year Period

Texas colored farmers are playing an important part in helping that State regain her prewar position in cucumber production for pickles, reports W. C. David, Negro State Leader of Extension Service.

During the 10-year period 1934-43, Texas farmers fed about 236,999 bushels of cucumbers annually into pickle factories. And during the last two crop-years before Pearl Harbor, they increased their production to an annual average of 445,000 bushels. Then production declined until it reached a low of only 72,000 bushels in 1945, says State Leader David

Out to increase their cucumber production to prewar levels, Texas farmers this year have almost doubled their 1946 acreage with the expectation of a yield in excess of 200,000 bushels.

Typical of the hundreds of colored farmers who are helping Texas recoup her position are 80 growers in and around Hempstead. They have formed a kind of cooperative and are growing cucumbers under contract arrangements with a Houston pickle factory. Liaison between the factory and the farmers is John H. Singleton, 62-year old farmer-businessman of Hempstead.

He operates a shed where his own cucumbers and those of the other 79 farmers are graded, weighed, and bagged for shipment. This year these farmers planted 92 acres to cucumbers and they expect to harvest about 5,000 bushels. Average price the farmers are receiving is approximately $1.50 per bushel or at the rate of $7,500 for their crop, says Mr. Singleton.

In addition to growing cucumbers, Mr. Singleton and the other farmers also raise watermelons, cantaloups, corn, and livestock. A few of them grow cotton, too, but cot-

Colored 4-H Club Girls Outnumber Boys By 44,000

In line with the national 4-H club membership pattern, colored farm girls continue to outnumber farm boys enrolled in 4-H clubs, according to the records of Extension Service of the U. S. Department of Agriculture.

Latest available records show that the number of colored 4-H club girls excells that of boys by 44,000. Of the 299,546 colored rural youth enrolled in 4-H club work, 171,779 are girls and 127,767 are boys.

Among all 4-H'ers, white and col-

New Farm Technology Creates Need For More Research

New developments in farm technology, soil conservation, and general economic conditions create a need for continuing research in land tenure, says Secretary of Agriculture Clinton P. Anderson in his annual report to President Truman.

Anderson lists seven knotty land-tenure problems in his report: (1) Too much crowding of farm families into some farming areas, (2) too many full-time farm families on farms that are inade-

Anderson Addressed Farmers at Tuskegee Said South Could Adjust to Mechanization

Methods by which farm people in the cotton South may adjust to mechanization were discussed Wednesday by Secretary of Agriculture Clinton P. Anderson in an address before a South-wide farmers conference at Tuskegee Institute, Tuskegee Institute, Alabama.

After praising Tuskegee for its contribution to better farming through the work of Dr. F. D. Patterson, Booker T. Washington, Dr. George Washington Carver, and T. M. Campbell, Secretary Anderson told the farmers that they could make a satisfactory adjustment to mechanization and share in the progress of American agriculture.

"You have heard a great deal about the mechanical cotton picker," said Anderson, "And you have wondered what it means in terms of the economy of the South—and in terms of your own farm.

"The ups and downs of cotton farming are all too familiar to you. Many of you have learned about cotton the hard way. You have worked all season —planting — plowing — chopping — picking only to see the price of cotton dwindle at marketing time," declared the Secretary, "and with it have dwindled your hopes for a two-row cultivator or a new kitchen stove."

Anderson then pointed out that although the cotton situation has improved in recent years, cotton still faces stiff competition from foreign grown cotton and from synthetic fibers such as rayon, nylon, spunglass, and paper products.

Recruits Sought To Fight Cancer

Field Army Commander of Cancer Society Seeks Million Volunteers, Negro and White

New York—Mrs. H. V. Milligan, National Commander of the Field Army, that volunteer branch of the American Cancer Society, has called for one million recruits, Negro and white, to carry on the war against cancer, it was announced this week.

Recruitment to double the one-million membership of the Field Army was started two months ago, Mrs. Milligan reported.

"With the annual drive for funds starting April 1," Mrs. Milligan said, "the need for volunteers takes on added emphasis."

The American Cancer Society officially explained that fund-raising is an important part of the Field Army's activities but is only one of the many services performed by this nation-wide organization.

"First we have to raise the money to carry on our work," she said. "Our many services include education: telling the people about cancer's dangers and how to avoid them; service: financing facilities for the diagnosis and treatment of cancer, furnishing material for home treatment: and research; furnishing funds to institutions, universities and hospitals where investigators are working to find the causes and possible cures for cancer.

Long-Range Farm Program Proposes Price Dip When Surpluses Develop

Washington—(AP)—A long-range farm program which would allow consumer food prices to decline when food surpluses developed was advocated yesterday by a senate agriculture subcommittee.

The larger the surplus the lower would prices be allowed to go.

At the same time the program would be designed to assure farmers a fair share of the national income.

The program differs sharply from the present one. The latter tends to maintain inflexible prices. That is, the minimum price is the same regardless of the supply.

Further, the present program merely assures producers a minimum price for their products—a guarantee which may or may not give the farmer a proper share of the national income.

The new program was drafted by a subcommittee headed by Sen. George D. Aiken (R. Vt.), who has long been a leader in farm matters. A bill embodying provisions of the program is expected to be introduced in the senate Monday. Aiken said he will press for its passage this session.

The program also would have as one of its goals a high level of farm production at all times. As the subcommittee said, "people need adequate food in bad times as well as in good times."

Devices such as acreage allotments and marketing quotas to restrict or curtail production would be used only as a "last resort." Instead, when surpluses tended to arise, the government would seek to encourage consumption by means of subsidizing consumption by low-income families and by diverting extra supplies to school lunch programs and industrial by-products.

It also would provide for government "incentives" payments to farmers for carrying out soil-conserving and rebuilding practices which landowners would not be able financially to carry out without public help.

A main feature of the program is that dealing with governmen financial support of farm prosperity. It holds that farmers should be guaranteed a fair share of the national income, perhaps 15 per cent on the basis of present conditions. Further, each farm crop or product should be assured a proper share of the farm income.

The proposed program would set up a system of flexible price supports by the government. The price support levels would go down when production exceeded normal needs, and go up when it dropped below such needs.

The subcommittee explained that the combination of a lower price support and a big crop would provide as much income as would a relatively high price support and a short crop.

The program also would (1) extend benefits of the government's social security system to farmers (2) help farmers find ways of reducing their production costs, (3) encourage development of the owner-operated family type farm as the "basic ideal" for agriculture as contrasted with corporation-type farming, (4) protect farmers' right to engage in cooperative marketing.

A traveler stopped in a small town in the Ozarks and put up at the local hotel. While talking with some of the natives, he started to tell the mthe story of Andrew Carnegie.

"When Carnegie came to this country he had only 25 Cents in his pocket, and when he died, he left more than $25,000,000" "Well," mused an old native, "he must have had a very savin' woman."

Grocer Plans To Out Super Super Markets

Oakland Calif.—(UP)—The supermarket of today will be as outmoded as the old pickle-barrel general store when the owner of one of the world's largest grocery stores has his way with the food business.

The super-market will be relegated to the category of the corner-grocery, domed by giant super-duper markets contemplated by multi-millionaire Edmond Herrscher, one-time attorney and now a California food merchant.

If you think the drug stores took over the hardware and toy store business, look what's going to happen to the grocery business.

1-Stop Service

Herrscher visions a sort of one-stop shopping center, a little city with groceries, post office, hairdresser, laundry and cleaners, shoe-repairing, dentists, doctors, a bank and bill-paying service, drugs, florist, candy and liquor store all under one roof.

"Parking underneath," says Herrscher, "enough for 3000 to 5000 cars." Then an automatic esculator to the shopping center, drop the babies off at the free nursery and spend the rest of the afternoon shop ping for the week's food, a new hat, and maybe a fur coat."

Herrscher points to his huge Andrew William's store at one of Oakland's busiest intersections as the embryo of he idea. The candy the florist and the tot shops already are going concerns there.

All This And Autos Too

He's even started selling Kaiser-Frazer automobiles in the store. So far, the store has had 33,000 inquiries about the Kaiser that was driven through the big doors and plunked down amidst the groceries. Possibly a revolution in the automobile selling business hinges on the success there.

And Herrscher doesn't want his customers to walk blocks and blocks along the aisles to pickup their cans of peas and soup and soap and meat. So he's installed electrical go-carts, mechanized versions of today's rolling grocery baskets that look like fugitives from an amusement park. Blueprints show a protected space in front for the kiddies, with a false wheel for them to play at driving while mama does her shopping.

Herrscher is disgusted with the business his grandfather and father were in before him, since woy back in 1856 in San Leandro.

"The worst conducted business in America", he says. "Markets are dirty. Thirty-five per cent of the fruit and vegetable businesses is lost through waste and shrinkage."

Herrscher thought the frozen food operation was bad, too.

"Customers were annoyed at having to pull back the covers on the freezing units to get at the food," he said. So he invented a frozen food cabinet that didn't need a lid, Engineers said it couldn't be done but today Herrscher's frozen foods stand right out in the open easy to grab.

Many Useful Garden Chores Can Be Done Right Away

BY DR. FLOYD BRALLIAR

Tennessean Garden Editor

Finish pruning fruit and other trees, grapes roses and other vines and shrubs that bloom on wood that grow this season.

It is best not to prune early flowering shrubs till they bloom, then the cuttings may be used as cut flowers.

Fill in ruts in driveways with gravel or cinders.

Look over all plantings carefully for scale insects, galls, and insect nests. Remove and destroy all found. Scrape for scale if found.

Build or repair coldframes and hotbeds. Start early seed plantings in coldframes or hotbeds outdoors.

Spade the kitchen garden as soon as the ground is dry enough to work without "puddling."

Lightly fertilize early blubs.

Sow Seeds in Flats

Sow seeds for later plantings outdoors, in flats, seed boxes or shallow pots. Hardy vegetables as well as annual flowers may be started in this way.

Re-pot ferns and other houseplants which are crowded or need rejuvenation. Use fresh, fertile soil or apply dry or liquid fertilizer but not in too heavy doses.

Spray house plants with a fine mist once a week (or wash in the kitchen sink), give them cool, fresh air at night (avoiding drafts and cooking gas). and they will soon show new growth.

Brighten up your living room windows with some new house plants; African violets, geraniums, begonias, etc.

Order vegetable, flower seeds and plants at once if you haven't already done so. Also buy your fertilizer, tools, insecticides and other garden supplies. Most items will be available but some shortages already exist.

Will Save Time

Make a garden plan: This will save time and confusion later on.

Make a plan of your place, and add at least a part of the new shrubs, evergreens, fruit and shade trees, small fruits, and vines you may need to spruce it up and make it a beautiful home.

File all catalogs, bulletins, leaflets and clippings that may be useful later.

Test any old seed—don't take chances. Simply place a few of the seed between wet blotting papers in a saucer and keep in warm room. If they don't germinate 75 per cent or better, use fresh seed.

Read a few good catalogues.

Extension Workers Seek To Improve Landlord Tenant Relationships

Washington, D. C. Major emphasis was placed on the improvement of landlord-tenant relationships last year by Negro Extension workers, says Director M. L. Wilson of Extension Service in his annual report to Secretary of Agriculture Clinton P. Anderson.

Among the improvements listed are an increased number of written leases and better opportunities for tenants and sharecroppers to produce more of their food at home. The latter was achieved by getting landlords to allot more land to their tenants for gardens and for keeping poultry, hogs, and dairy cows, and by helping renters and croppers to recognize the health and cash benefits of growing more of their own home food supply.

In addition to this program and their regular demonstration work, colored county agents also helped hundreds of veterans to get started in farming as owners and tenants, says Director Wilson.

Examples of home improvements by colored farmers also are cited in the report. In one Aarkansas county 568 colored farm families improved their homes and lawns. And the director says throughout the South, Negro farm women and 4-H girls canned more than 30 million quarts of food last year.

State Farmers Increase Use Of Cover Crops

Tennessee farmers are annually increasing the use of winter cover crops, seeding larger acreages of alfalfa and other legumes, constructing more miles of terraces, improving a larger acreage of pastures and making more use of time and commercial fertilizers. These facts are revealed in the annual reports of the boards of supervisors of the various soil conservation districts throughout the state.

The reports are distributed among farmers in the districts that they might have a knowledge of the program being conducted in their county. Typical of the reports are those compiled in the Weakley and Rutherford county districts.

During the seven years that the Weakley County Soil Conservation District has been in operation 899 acres of land have been reclaimed and 597 miles of terraces built.

Of the 4,410 farms in Weakley County with a total acreage of 331,-224, there were 772 farms under cooperative agreement with the district in 1947.

Soil and water practices were applied to 8,908 acres of land during the past year, it was revealed. A total of 2,629 acres were planted in cover crops, while 3,311 acres were used for the growing of row crops.

About 138 acres of woodland were improved 5,878 acres were established to permanent pastures, and 54 acres were converted to wildfire purposes.

In control measures, terraces aggregated 70 miles, with 45 acres of terrace outlets or water disposal areas.

Other important work included 75 acres of Kudza seeded, 107 acres of sericea sown, 316 acres benefitted by drainage ditches; 137 farm ponds constructed and 102 ponds stocked with game fish.

The main drainage problem to be undertaken by the conservation district was in the Rushville section of the county. Two and a half miles of dredging was carried out, and six miles of creek line was cleared, the report showed.

The project comprised a drainage area of 19,000 acres of some of the county's most fertile land. It is said to have benefitted some 53 farms by making a total of 1,136 acres of land available for crop production.

In Rutherford County 358 farmers are actively co-operating with the district. The report on activities in that county shows 4,801 acres were cultivated in crop rotation last year and 4,311 acres were seeded to cover crops in the fall of 1947.

More land is being terraced each year and farmers are learning the value of contour farming, the report said. While terraces were constructed on 600 acres during the past year 850 acres were cultivated with the contour on the co-operating farms.

Stock water ponds were constructed on 17 farms and 11,450 feet of diversion ditches were built.

Seventy-five farms representing 11,153 acres were brought into the district conservation program during the past year.

Feed Outlook

Farmers who use commercial feeds in producing beef cattle, milk, poultry, or eggs should keep up, week by week, with the supply and price situation on the main feed ingredients. Generally speaking, grains and other carbohydrate feed is scarce. Proteins—cottonseed, soybean, and peanut meal—and hay are fairly abundant and more reasonably priced. Compare prices and select commercial feeds wisely, then balance with homegrown grain, forage, and winter grazing for most profit from products you market. Be sure that you have the finish on turkeys. poultry, and livestock that will please your consumer and bring best profit.

A good cold-weather rat poison is a semi-dry cereal mixture. Rats won't eat poison meat which has been frozen.

Senator Stewart Asks Strong, Long-Range Agricultural Plan

By Mary James Cottrell

Staff Correspondent

Washington, Jan. 26—President Truman's request for restoration of soil conservation funds cut by Congress last year backs up American faith in agricultural abundance for the future, Senator Tom Stewart of Tennessee said today in urging that Congress adopt a strong long-range farm program.

Senator Stewart pointed out that the President has asked Congress to authorize an agricultural conservation program of $300,000,000 for 1949, in place of the $150,000,000 program in effect this year, so as to meet soil problems brought on by heavy production.

"We must have strong, productive agriculture after, as well as during the world food shortage," said Senator Stewart, Tennessee's member of the important Senate Agriculture Committee. He also emphasized that we must have agricultural raw materials for industry and good rural customers for the products of industry.

"Impoverished soil will support neither good eating nor good business," said Senator Stewart. "The public interest demands conservation, just as the public interest has demanded emergency production."

Although the Marshall Plan contemplates some reductions rather than any increase in food exports from the United States, according to Department of Agriculture officials, demands on American agriculture will continue at very high levels and call for top production.

In view of high demands and the fact that the country cannot count on the extraordinary high yields of recent years, crop acreages, especially of grain, should be maintained, Senator Stewart believes.

Senator Stewart said he had been advised by the Department of Agriculture that 1948 production goals call for 356 million acres in crops, which is about nine million more than the indicated actual acreages of 1947.

"We have no alternative but to continue high production at this time", said Senator Stewart.

"But we do have opportunities to minimize the soil problem. Ever since I have been a member of the Senate I have worked for all soil Conservation measures. I firmly believe that this country must continue to emphasize the value of protecting our soil if we are to remain a rich agricultural country. Continued top production makes it especially important to continue and step up our use of conservation practices which tend to protect the soil from damages during the period of intensive use."

Oklahoma College To Study Mechanized Cotton Harvesting

The cotton research program of Oklahoma A. and M. College is expanding to include a new special station, according to reports received by the U. S. Department of Agriculture from the Oklahoma State Extension Service.

The new research station will occupy 300 acres and will be devoted to problems related to machine hearvesting of cotton. The college experiment station has already done considerable work in the testing of cotton varieties.

Plant A Garden

Vegetables can be grown in a garden for much less than it would cost to buy them, and the quality and health value is much higher. A one-half acre garden is recommennded for the average family.

Grapes

Cuttings should have three buds and should be planted with two buds under ground to sprout roots and the other just above ground.

Learn Habits, Requirements Before Setting Shade Trees

By Dr. Floyd Bralliar, Garden Editor, The Nashville Tennessean

Planting trees and shrubbery for decoration is growing in importance, especially among those who own new homes.

Before setting any trees, the proper thing is to become acquainted with the characteristics and requirements of the particular kind of trees or shrubbery you wish to plant, as well as their ability to withstand the shock of transplanting.

Some trees transplant easily, while others require great care in moving, or they will not grow. Yet they may be equally adapted to our needs once they are established. In studying what to plant in any particular location, we must remember that many trees and shrubs that are perfectly adapted for planting on the lawn are not satisfactory for street planting.

Probably the most popular shade tree in our country is American white elm. This elm is one of the most adaptable trees to new growing conditions and it is easily transplanted. It grows rapidly and is able to take a terrific beating from winds and sleet without breaking and is reasonably free from insect pests.

This elm is subject to the fatal Dutch elm disease for which there seems to be no cure. Dutch elm disease is gradually spreading over more and more of the United States, and for this reason we do not recommend the planting of the American White elm any where Dutch elm disease has been as close as 100 miles.

Fortunately we have another elm that is native to the South that is almost equal in every particular to the American White elm and so far it has never become infected with Dutch elm disease. This elm is commonly known as the cork elm, because in the early stages of growth, the twigs and small branches bear ridges or wings of cork. As the tree grows older and larger, this cork gradually disappears. Botanically it is ulmus alata. This elm should be planted wherever we wish to use elms. Unfortunately few nurserymen are growing this tree so we may have to go to the woods to find it.

We cannot recommend the small leafed Chinese elm except in places where it is too dry for the ordinary elm to grow. This elm grows very rapidly indeed but it breaks easily from winds and the insects eat the foliage so badly that it is a constant fight to keep the leaves looking well. Either the American white or the cork elm is well adapted to street planting.

For lawn planting, especially where the soil is rich and deep, few trees equal our common American linden. It is a rapid grower and naturally assumes a pyrramidal shape, holds its leaves well, and is not subject to disease. It blooms freely, and while the individual flowers are not conspicious ,they are very sweetly fragrant and are great honey producers. The tree is long lifed and easy to care for.

The sugar maple has long been a very popular shade tree, but unfortunately to do its best it must have sandy soil with plenty of humus. It is a slow grower but once it is well established, which means about 25 years after setting the small tree, it can hardly be surpassed. The red maple is very widely planted because it will grow in any kind of soil and is one of our most rapid growing trees, however, it is a nuisance because it scatters thousands of seeds every year and practically all of these seeds will come up. They must be disposed of in some way though they are not difficult to kill. The tree, however, is subject to the ravages of insects, breaks too easily, under stress of high winds or the heavy load of sleet or snow and is more subject to disease than it should be. However, it is one of our very desirable trees.

Grow Own Tomato Plants, Guard Roots, Bralliar Says

By Dr. Floyd B. Bralliar

Most plants do not mind it very much if their roots are broken in transplanting and to do so is a distinct advantage for some varieties.

Lettuce, if not transplanted, naturally produces a long taproot that reaches deep into the ground but it does not produce enough branching roots near the surface to enable it to produce a large head or a large clump of loose leaves in a short time.

Cabbage plants are scarcely injured at all by having their first roots broken off if enough are left on to feed the plant until it makes a new root system which it does in a surprisingly short time.

But this is decidedly not true of tomatoes. Tomatoes are rather weak-rooted plants and to do their best should be kept growing right on from the time the seeds come up until fruit begins to ripen. If they are injured in any way enough to stunt their growth even for a short time, they do not produce nearly as much fruit as they are capable of producing.

Own Plants Advised

For this reason we recommend those who have a hot bed or greenhouse, or a good sunny south window in their dwelling house that doesn't depend on gas for heat or cooking, to grow their own plants in the following manner.

Get empty pasteboard drinking cups three or four inches deep and at least two inches in diameter at the top, punch a hole through the bottom, fill each cup with good first class soil, and plant two tomato seeds in it. Keep it properly watered but not too wet.

When the plants come up and make their first pair of character leaves, pull one of these plants out without injuring the other. Do not start to plant too soon for it never pays to let the plants get too big before setting in their permanent home.

About the 10th or 15th of March is early enough to plant these seed. If they are kept growing right along they will be big enough to set out the last week in April and this is early enough to set any of your tomato plants in Middle Tennessee.

How To Plant

When you get ready to set the plants in the open ground, dig the hole where the plant is to go, water the plant well enough to have the dirt stick well, and cut the pasteboard cup off with a sharp knife, disturbing the ball of earth as little as possible.

Plants set in this way will scarcely know that they have been disturbed especially if they are shaded for two or three days.

The advantage of growing plants in this way is that each plant has plenty of room, because it is not crowded by its neighbor. Therefore it develops into a short stocky plant rather than growing tall and weak. Second, its root system is never broken up, therefore it does not get a set back when it is set out.

No family needs more than one dozen to 25 tomato plants in order to produce all the fruit they need for home use, so you can easily find room to grow these few plants right.

Poultry Tip

Keep floors of your poultry house dry. Try adding one pound of dehydrated lime to litter for every five square feet of floor space.

Canner Care

Whether your pressure cooker is new or old, one of the first steps toward keeping it in good condition is to read the directions that come with it. If you have lost these directions, write the manufacturer for another copy.

Successful Potato Planting Requires Excellent Seed

By DR. FLOYD BRALLIAR

Garden Editor
The Nashville Tennessean

Lesson three will deal with the planting of potatoes but there is not room in one lesson to cover all of the important steps.

Naturally the first and most important thing is to get the seed. The standard rule in potato-growing countries is to plant eight bushels of seed on an acre of land. This would mean one bushel of seed for every 20 square rods. If the land is poor, as little as six bushels of seed may be used per acre and if it is exceptionally rich and deep, as many as 10 bushels may be used.

We shall not say too much about the varities of plants for of course opinions vary and some people live in localities that are particularly suited to a particular variety that does not do well over all of our territory. We feel safe, however, in saying, that for most of Middle Tennessee, we should use Red Triumph or Irish Cobbler.

Because of the prevalence of disease, if we buy our seed, we should be careful to buy only certified seed, and even then we should disinfect the seed before planting. There are several chemicals that may be used in treating the seed, and all are good. Usually your county agent has arranged for a supply of the one of these he thinks is best in his community to be handled by a local dealer. Call him and ask him what to use, where to get it, and how and when to use it.

It is time now to buy your seed potatoes and if possible keep them spread in a warm place where they will get several hours of sunshine a day, a week or two before planting. The seed should be cut a week or 10 days before planting in order to allow them to form a dry callous over the cut surafce. This saves many pieces from rotting when they are planted. It also does away with the necessity of placing the pieces in the ground with the cut side down. It is not wise to cut the potato until you are sure it has been disinfected and the disinfectant has had time to dry. This means at least two days after the disinfecting is done.

We do not advocate the actual planting of potatoes before the middle of March and no later than the middle of April. When cutting potatoes, each piece should have only one or two eyes. The pieces should be from 30 to 36 inches apart and should be laid off deeply enough so that the potato will be covered three or four inches.

Should the potatoes come up early enough that the tops should be killed by the frost, cut them off level with or just under the surface of the soil at once before the sap has time to sour and decay. The new tops will come out in a suprisingly short time and one of them might be four or five days later in maturity. The yield will be just as great if they have never been frozen.

Farm Talk With Far m Folk

By Jesse Safley

Many farmers fail to practice good livestock management during bad weather, fully aware of the fact that they are inviting serious financial losses. Livestock neglect was very noticeable last week when most farmers turned their cattle out in snow six to 12 inches deep.

It is hard to understand why farmers follow this practice of allowing their milch cows, beef cattle, sheep and poultry to spend eight or more hours each day out in the weather when they have sufficient barn space that offers at least some protection.

We drove by farms during the past week in four counties, Davidson, Williamson, Rutherford and Wilson. We made note of the number of farms where livestock was out in the snow, wandering over fields, lying in the snow and drinking from frozen ponds and water tanks.

On more than 50 per cent of the farms, we saw livestock outside and in most cases we could see that there was sufficient space in the barn for them. Many adopt this policy. If the cows want to stay under the barn they will. This would probably be true if it were not for the fact that there is usually one or more animals in that knock the others about. The only time the other animals get under the barn is after the rowdy animals lie down. This is especially true when horses or mules are allowed to run with cattle.

Snow and sub-freezing weather will soon leave, but it may mean losses to the careless farmer for years.

As a result of recent exposure, many cows will contract diseases which could prove serious. One disease harassing dairy herds throughout the State is mastitis. It can strike at an ytime. When a milch cow is forced to lie in the snow or on the frozen ground her udder will no doubt be injured.

Authorities say mastitis organism,, although inactive, is present in the udder of many cows. When that udder is injured, the organism becomes active and may prove very destructive. An animal's health is often impaired otherwise by extreme exposure.

If there is anything during the whole year when livestock need extra attention, it is during freezing weather. Feed, water and shelter is very essential. In most cases, farmers will provide extra feed of some type, but they often sadly neglect the water supply.

We saw animals drinking from ponds and tanks where the ice, sometimes as much as six inches thick, had been broken. Other animals were seen trying to quench their thirst by licking snow or ice on ponds where the ice had not even been broken.

A cow consumes several gallons of water daily provided that water is of a desired temperature. They drink a very little water if it is ice cold. Livestock should not be expected to produce unless they are properly watered. Farmers who have water inside their barns or a supply of running water are fortunate. Those who do not should attempt to supply water at a temperature at least above freezing.

Although the price of corn and other feeds are unusually high, many farmers continue to feed their hogs in open pens and on the ground. It has been determined that approximately 16 per cent of corn feed on the ground is lost. That 16 per cent could easily represent the profit of a whole year's work on many farms. When hogs are not afforded some type of protection from snow, cold rains and zero weather, more energy is required to keep the body at normal temperature. That means loss of weight or less rapid growth.

Each lamb produced this year represents some $20 or more potential income, most of which could be net profit to the farmer. However, lambs "belly deep" in snow were seen on many farms. Doubtless many lambs were lost due to freezing. Even if the lambs do survive the rough treatment, their vitality will be lowered to such an extent they will be less profitable.

Many other unprofitable practices could be mentioned, such as allowing chickens to hunt their own shelter, sows to farrow without protection from cold and snow and allowing valuable farm machinery to take the weather as it comes.

There is no doubt but what farming will become more profitable when more farmers take better care of their investment.

Winter Woodland Jobs

Wise farmers use treated posts when making replacements or constructing new fences. Farm labor, when not fully occupied with other farm work, can be used effectively in treating posts.

Check Feeds For Contents, Chemist Says

Dairymen and other buyers of commercial mixed feeds do not read the tags attached to the bags as closely as they should and they are not familiar with the terms used on those tags, State Chemist V. L. Fuqua said recently. "As for some of the ingredients in some feeds the farmer would be just as well off feeding saw-dust, yet the farmer has no one to blame but himself for buying the feed," he explained.

"In most instances the feeds are within the law," he said.

The ingredients are of very little to no value are ground oat screenings, recleaned grain screenings, lespedeza screenings, ground grain screenings from wheat, flax, oats and rye, and flax plant by-products.

Defining the meaning of some of the terms, the state chemist said that ground oat screenings were nothing but waste material containing sand, small rocks, weed seed and stems of various plants.

Lespedeza screenings in many instances will include dodder seed, which are too small to grind and so hard they are not often digested.

Ground grain screenings from wheat, flax, oats and rye is nothing more than waste from grain elevators.

"Ninety per cent of lespedeza meal in feeds is no better than the same amount of sawdust," Fuqua declared.

While the information on the feed tag is correct as far as the producer of the feed is concerned, the farmer should be able to recognize valueless ingredients.

In most instances the first few listed ingredients are of good quality and include linseed meal, alfalfa leaf meal, cotton seed meal, wheat bran, oats and the like. However, there is often a questionable ingredient on down the line.

"Know the value of the various feeds," Fuqua cautioned.

Cottonseed meal, which, for so many years was a dependable product, now bears watching. While the protein content is still in the vicinity of 40 per cent in most cases, the fat content by virtue of a new process is lowered to one-half of one per cent. There should be around five per cent fat in cottonseed meal.

How To Prevent Fire

Will care and caution actually reduce our disgraceful fire loss? The experience of New York City during the recent record snow storm provides a vivid answer.

The streets were so blocked with snow that fire apparatus could move only with great difficulty, and in some places could not move at all. The Fire Commissioner issued constant warnings to householders over the radio and through the newspapers. As a consequence, no fire of large size occurred during the 48 hour period of extreme danger which followed the storm, and the average number of fires and alarms declined by nearly half.

This was an emergency situation, and the people of New York undersstood that and acted accordingly. But the incident proves far more than that. What was done in New York for two dangerous days can be done everywhere in the country every day in the year. For, whether conditions are normal or adnormal, fire always constitutes an emergency. It is always waiting, ready to strike when carelessness gives it a chance. That is why fire claimed a money toll of nearly $700,000,000 last year—the worst year in our history.

Let the people of New York keep up the good work. And let the rest of us follow.

Pasture Uses

Good pasture is nature's best roughage for dairy cows and the animals do the harvesting and hauling. A mixture of pasture grasses and legumes, when well fertilized and managed, pays good dividends, livestock experts say.

Farm Talk With Farm Folk

By Jesse Safley

Sooner than we expect, we will be asking what became of 1948? The new year is almost one-fourth gone and farmers are still uncertain as to which way to turn in planning production for the next nine months.

Many will remain undecided pending definite congressional action on legislation directly affecting agriculture. Contrary to belief, farmers are not making plans to increase production due to recent reports concerning the restoration of food, gasoline and fuel oil rationing and price controls on meat and other items.

Rationing passed the rumor stage last week when top government officials asked for $1,000,000 to bear the cost of printing coupon books. If rationing materializes, other controls that will hamstring production will surely follow.

The farmer could tolerate frequent arguments with rationing officials during the war because he had a sense of duty to produce regardless of barriers. His attitude and tolerance will not be the same now. He will not exert as much effort in producing more meat and foods with worn out, unreplaceable farm machinery as he once did. He can't compete with industry for labor and pay that labor, with income from products that he has no assurance of being able to sell at a profit.

These things should be considered before adoption controls that will surely lessen production.

Meanwhile, the farmers can make definite plans about some things. It should be foremost in his mind to free his farm debt or at lsast put it on a safe basis. Payments which can be easily made now may be impossible in a few years. Now is the time to get ahead on the farm debt payments.

The farmer who mortgages his farm now to buy livestock and equipment is placing a lot of confidence in the future. Many farm families are going heavily into debt for new automobiles, furniture and farm equipment. It is easy to understand their desire for a nice, comfortable car to replace that old model. But unless you can pay cash for it, don't buy it. Don't take a chance in view of the present high price of automobiles. You might wind up with no automobile at all.

Those extra rooms that are being added to the homes and that new furniture bought on "easy payment plans" could add up to a debt too large for the farm to support in case of illness in the family or a break in the price of farm products. It is foolish to forfeit the possibility of a happy future for a few additional luxuries now.

It is also wise to bear in mind that a mule paid for will plow more corn than a tractor with equipment lost by lack of payment. Unless we are able to pay cash or a substantial part of the purchasing price, we should delay those purchases.

There is no legislation pending that will prevent farmers from taking good care of livestock and equipment they already own.

Prevent accidents which annually cost thousands of lives and millions of dollars. Be cautious with fire and eliminate all hazards. Save money by eradicating rats and other farm parasites. Produce food in both quantity and quality for home consumption. Prevent waste of perishable products and the soil by combatting erosion and at all times keep faith in America.

Raising Level Of

(Continued from page 1)

300-acre farm about 40 years ago. They cut it out of the forest and sold part of the timber to meet the notes. Mrs. Thompson set out to help pay off the farm by growing a garden, raising chickens, and milking the cow. "Most of the money from our cash crops and from my husband's part-time job on the railroad was in the clear," says Mrs Thompson.

About 20 years ago, her live-at-home program expanded into a source of sideline cash income. They got the idea of selling home-grown products in town, soon developed a route in Washington, 85 miles away, and began selling vegetables, chickens, eggs and butter. A few years ago, they added sausage and cured meats to their list. By 1935, they had saved enough to modernize their home.

The farm is now run by their son, J. Conroy Thompson, a former student of agriculture at Pennsylvania State college. Working closely with his county agent and his soil conservation district, the younger Thompson has succeeded in almost completely protecting the hillside farm against erosion. Except for corn and truck crops which he grows on the more level acres, Thompson grows no row crops. Small grain, hay crops, and pasture occupy most of his farm which he keeps highly productive through the use of manure crops and fertilizer.

During a recent Extension Service tour in Virginia, about 100 of the leading colored farmers of the State spent a whole afternoon visiting the Thompson's farm. They inspected the terraces in the fields, the tractor, haybaler and other farm equipment in the barn, saw their fertilizer supply, their poultry houses, and the well appointed home in which the Thompsons live.

Through such tours, says Mitchell, the Extension agents hope to whet the appetites of other farm families for better homes and a higher level of living.

Mitchell helps with the super vision of colored Extension workers in the upper tier of the Southern States, while T. M. Campbell serves in a like capacity for the lower tier of the Southern States from Florida to Oklahoma.

New Farm Technology

(Continued from page 1)

quate, (3) some families on farms that are too large for optimum and sustained use of land, labor or water resources, and (4) too many tenants farming with uncertain and often short farm tenure.

Other land-tenure problems listed are: (1) Antiquated land-leasing laws and customs which do not provide opportunity or incentive for long range well-balanced farming systems, (2) Insufficient safeguards against land abuse and exploitation, and (3) Penalizing of tenants, who increase the productivity of rented farms in cases where the rent is increased as the farm is improved.

However, the Secretary points out that farmers came through World War II in a favorable tenure position—with less than one-third of the Nation's farms tenant-operated. This is the smallest percentage since 1890, says Anderson.

But he warns that it should be noted that much of the recent increase in ownership by farmers reflects the purchase of land at inflated prices, and also the purchase of farms that are too small and unproductive to return an adequate living.

W. C. David, State

(Continued from page 1)

ton is no longer their main cash crop.

Farmer Singleton grows no cotton on his 361-acre farm. This year his cropping program is as follows: 85 acres of watermelons, 85 acres of corn, 180 acres in pasture, 5 in cucumbers, and 3 in cantaloups. "I stopped growing cotton in 1944," he says, "because I just didn't have the help."

Farmer Singleton started farming as a tenant in 1912. After eight years of renting, he began buying a farm of his own. Today he owns 157 acres and rents 204 acres more. Also, he owns a tractor, three trucks, and 50 head of cattle. The trucks are used for hauling his own crops and those of his neighbors. State Leader David says that Mr. Singleton has developed quite a sideline trucking business.

"Within the next couple of years, I plan to add another truck and build a real shed and grading station," says Mr. Singleton, "because, you know, we farmers don't figure on stopping here with our cucumber crops. We hope to double our acreage next year; the pickle factory in Houston can use all we can grow."

State leader David says that the cucumber program of the 80 farmers at Hempstead can be duplicated several times in the State. "My staff of Extension agents are crops as a sound cropping system for small farmers."

Anderson Says Real Progress Made In Developing Crop Insurance

In a special report to the Congress on Federal Crop Insurance operations in 1947, Secretary of Agriculture Clinton P. Anderson, says that for the first time a substantial accumulation of premium reserves in excess of losses has been achieved.

While the report points out that loss adjustments are not yet completed on cotton, corn, and tobacco, it reveals that premiums can be expected to exceed losses paid to operators of insured farms by about $15,000,000.

There is no more miserable human being than one in whom nothing is habitual but indecision. —W. JAMES.

Farm Prosperity And

(Continued from page 1)

tain from the United States, Secretary Anderson mentions several types of imports which he believes might be expanded without hurting domestic business. Among these are shipping and services to American tourists; products of tropical agriculture; the industrial specialties of foreign countries; and various minerals and metals not produced in sufficient quantity in the United States.

Agricultural price supports, the report observes influenced the 1947 level of prices to a slight extent. Purchases for price-support purposes during the first half of the year were limited top potatoes, eggs, dry milk solids and turkeys. The market prices of some agricultural commodities, owing to the strength of the demand at home and abroad, were from 30 to 50 percent above announced price-support levels. Market prices for agricultural products in the January-June period averaged 120 per cent of parity. Legislation prescribed support-price action in most cases at 90 percent of parity —92 1-2 per cent for cotton. On the much higher average level that actually prevailed, factors other than the price supports were the mainstay, notably full employment at home and an urgent commercial and relief demand abroad.

In the year ended June 30 last, says the report, this Nation exported more than 19 million long tons of grain and other food, mostly to countries left hungry by the war and its aftermath. This was more food than any country had ever before shipped abroad in a single year; it was significantly more than the United States itself exported in the immediately preceding marketing year, though 1946 saw the culmination of the President's nine-point world relief program.

Main factors in the new achievement were another record harvest in 1946 and highly effective cooperation among farmers, railroads, transportation companies, and Government agencies. Aided by the International Emergency Food Council, with its allocation arrangements, the Government, was able to send the food to the areas of greatest need. Huge though the shipments were, they did not deprive the people of the United States of essential food supplies. Civilian consumption per capita continued here at the high level of recent years through a combination of high consumer buying power and abundant farm production.

As in the previous year food grain was the backbone of the export program. Easily shipped and stored, and high in food value in relation to the cost, food grain was of supreme importance in relieving the world food crisis. Wheat was again central in the task. Altogether the grains, including rice, provided slightly more than 15 million tons of the total shipments. Of this total, wheat and flour, calculated as wheat equivalent, accounted for 10.6 million tons. Corn, oats, barley rye, and grain sorghums accounted for slightly more than 4 million tons; rice for half a million tons. Other shipments included 501,786 tons of dairy products, 213.839 tons of fats and oils, 231,696 tons of meat, and nearly 3 million tons of other foods such as dry beans and peas, eggs, fish, sugar, potatoes, vegetables, fruits, and nuts.

The report says the United States may eventually have wheat-surplus problems once more; but it probably will play an active role in the export market for some time, since the world food emergency shows no signs of terminating soon. Moreover, the long-time world demand may rise above the prewar level. Factors of importance in the long-time demand include further increases in the world's population, especially in India and China; the reduced production of wheat in some countries along with shifts to other crops; and the increased attention given throughout the world wherever possible to the problem of human nutrition.

From the standpoint of cotton producers the domestic cotton situation is much more favorable now than for many years. Surplus stocks of cotton in the United States have completely disappeared, and the carry-over August 1, 1947 is only 31 percent of the 1935-39 average. It is about 81 percent less than the 13-million bale carry-over of 1939. Cotton and cotton products command prices seldom equaled—prices several times those of prewar years.

Secretary Anderson declares that eventually American cotton will again meet with increasing competition from foreign cotton. Foreign production of cotton may increase rapidly under favorable conditions. Cotton's power to hold its own in markets at home and abroad depends basically on its competitive strength, and this depends in turn on a sound combination of up-to-date farm practices, correct regional and other crop adjustments, proper care of the soil, and realistic world-trade policy

"Cotton can meet this many-sided challenge,' says the report, "only through a many-sided program of research, efficiency in production, and wise policy in regard to the domestic and foreign competition. Cotton research is especially important in the competitive battle with synthetic fibers, paper and foreign cotton. Fortunately, the entire domestic cotton industry along with this Department and the State agricultural agencies has recently united in a strong program of research on cotton utilization and marketing All the participating groups have recognized that vigorous action is necessary along many lines, notably research, farm mechanization, market-development work, and international trade policy. To a challenge without historic parallel the industry is preparing a strong response."

As in former years the United Kingdom was the largest purchaser of American tobacco in 1946-47. For example, it took more than half of our exports of flue-cured leaf, which accounted for four-fifths of the total exports. High leaf prices in tobacco-produeing countries and the increased quantities of leaf required for the high cigarette consumption contributed to the heavy drain on dollar exchange. Hence, the British Government increased import duties on tobacco leaf by approximately one-half in order to decrease consumption and thereby save principally dollar exchange on the leaf purchases that would otherwise have been made.

In connection with the 1947 crop of potatoes, Secretary Anderson mentions that the Department of Agriculture endeavored to head off the production of another big surplus. It announced an acreage goal considered likely at a reasonable yield to be sufficient for our needs, and said price-support would be denied to any grower who exceeded his acreage allotment. Acreage planted to potatoes in 1947 was consderably less than in 1946 and less than the 1947 goal and the first production estimate (as of July 1) indicated a crop of only 352 million bushels or 124 million bushels less than the crop of 1946 and 24 million bushels less than the 10-year (1936-45) average.

Growing conditions in July were good to excellent and the production-prospect improved; nevertheless the output is not likely to give us such a nationwide surplus as we had last year.

Anderson Addresses Farmers

(Continued from page 1)

He said whether or not American cotton will be able to hold its own against its competitors, in the long run, will depend on price. And cost of production makes up part of that price—so, machines are being introduced to lessen the drudgery of hand-methods and cut the cost of production.

"How may you adjust your farming program to mechanization?" asked the Secretary. Then he replied, "There is no simple, overall answer. Some small farmers, white and colored, will shift from cotton to other crops, some will seek part-time off-farm employment, others may leave the farm altogether for industrial jobs. Probably the largest number will bring in machines and adapt them to their particular needs.

Anderson said that some colored farmers had already partly mechanized their farms, and that others would follow either through cooperatives, or by engaging heavy machinery on a custom basis.

One of the foremost problems which farmers face in adapting new machines to their needs, or in shifting to new crops is lack of adequate technical guidance, asserted the Secretary. "If we are to perform the important task of helping nearly half a million colored farmers adjust their operations to a more efficient agricultural economy, we must provide these farmers with expert guidance.

"To do that, we need more institutions like Tuskegee to train teachers, scientists, and Extension agents. . . The number of agents has increased from 550 before the war to more than 800 now. Even so, there are not enough colored workers, and their salaries are inadequate," said the Secretary.

And he added that the facilities for training colored workers are not adequate. "Colored agricultural colleges need more money than they are now getting through the appropriations for Land Grant Colleges. And it is my sincere hope that a way will be found by which more Extension agents and other agricultural workers may participate in the activities of he State experiment stations as a part of their regular training."

Turning to 4-H club activities, Secretary Anderson said, "It is my further hope that the same types of incentives for better farming will be provided colored 4-H boys and girls that are now made available to 4-H'ers of other groups. And I look eagerly for the time when the colored 4-H child will be included among the participants at the International Livestock Show.

In discussing industrialization of the South to provide more off-farm employment, Secretary Anderson said, "The Department is on record as favoring legislation through which we can cooperate with other Federal and with State and local agencies to encourage the sound development of rural industries.

"I testified for such a bill nearly two years ago. I pointed out that as the cotton picker, the flame-cultivator, and other machines became available in the South they would probably create a labor surplus which could be absorbed in local industries.

"What I like particularly about this proposed legislation," said the Secretary, "is that it would provide for training workers for industrial jobs. This is especially important to you, because many of your sons and daughters do not now have full opportunity to equip themselves for industrial employment. Almost equally urgent is the need for more opportunities for colored people to learn how to operate and repair the new types of machines which are coming into the South."

The world usually pushes a man the way he makes up his mind to go. If going up, they push him up; if going down, they push him down—gravitation, however, making the speed great in the decline.
—GEORGE F. TRAIN.

Colored 4-H Club

(Continued from page 1)

ored, girls outnumber boys by about 225,000. However, the larger enrolment of girls is no new development. For many years, 4-H club girls have outnumbered boys. Among the reasons given for the differential is the wide interest which girls have in 4-H clothing projects. Last year 4-H girls made more than two million garments in addition to their other club activities.

The total number of 4-H club youth now stands at about 1,600,000. This is an increase of 52,417 over the previous year. Colored youth make up to 19 percent of the total 4-H enrollment.

The annual report of Extension Director M. L. Wilson states that 4-Her's raised 716,000 head of livestock, grew 113,000 acres of gardens, and nearly 425,000 acres of food crops in 1946. In their poultry work, they handled nearly nine million birds.

Other 4-H activities included the preparation of 18 million meals, the canning of 20 million quarts of food, the bringing of 270,000 gallons of food products, and the drying, euring, soring, or freezing of 12 million pounds of food. ,

To help fight famine overseas, 4-H'ers in one West Virginia county collected and shipped four carloads of wheat. And thousands of clubbers in various States sent friendship boxes of food and clothing to neighbors in other countries.

Negro Farmers Complete 1st Unit Of $33,000 Community Center

The colored farmers of Montgomery County, Ala., have completed the first unit of a $33,000 community service center, according to a report received by the U. S. Department of Agriculture from the Alabama State Extension Service.

Recognizing the need of a community center for colored farmers who come to the city of Montgomery to sell their proucts and to shop, County Agent J. T. Alexander helped the farmers to organize a co-operative and launch a building drive two years ago. By last summer, the co-op had raised $10,000, purchased a lot, and begun building a community center. The first unit was completed a few weeks ago.

The unit consists of a lounge, a snack bar, rest rooms, lockers, and drinking fountains. The next unit will provide an auditorium and office space for the county agent and others. A drive is now underway to raise the remaining funds.

County Agent Alexander says that heretofore, farm people of his county had no place in the city of Montgomery to rest or relax during their business trips. They were forced to congregate on corners and at the railroad station.

Less Tobacco On Floors, But Prices Slightly Up

By Roy H. Milton

What does the 1947 crop of dark-fired tobacco look like?

This question has been prying heavily on my mind since the opening days of the 1947-48 market. The 1946 crop had presented such a pleasing picture since its quality was outstanding—one of the best I have ever seen. So little thin, lifeless tobacco was grown in 1946.

While the floor offerings were exceedingly light, a recent trip across the Springfield loose leaf floors revealed that the quality is not as good as that of 1946. Much of the offerings showed a slight greenish tinge and as a result the federal graders added a "V" to the grade, such as B3, FV, C3FV and X3FV.

Harrell Bell, one of the graders, pointed out that the growers were not exercising enough care in sorting the crop. He said that a large per cent of the fourth quality tobacco would go into third quality if the leaves having a greenish tinge were placed in a separate grade. This would mean a difference of $8 per hundred pounds between B3F46 and B4FV46 and if only B4FV46 was placed on the non-green tobacco, a difference of $2.50.

County Agent Charlie W. Blankenship of Robertson County said he was at loss as to what caused the dark tobacco to take on the green in curing, but that many growers had told him that the crop dried too fast in the curing barn. These growers expressed the belief that both the air and tobacco were short of moisture when the fires were started in the barns.

Some way, somehow, moisture should have been applied artificially. Some growers said they did so with splendid results.

Lawrence S. Morton, supervisor of the demonstration and education program, concurred with Blankenship.

I asked Morton how the market to date compares with that of a year ago.

He replied:

"Taking the crop as a whole (including markekts at Clarksville, Springfield and Hopkinsville), sales during the past week (2,204,736 pounds at an average of $32.22 per hundred) were nearly 2,250,000 pounds less than for the first full week last year, but the average price was $4.86 more.

"The light deliveries at Springfield and elsewhere are attributed to the lack of proper taking-down seasons and only fair stripping weather. A higher "floor" no doubt accounts for the higher price."

He added that a surprising and disappointing feature of the market was that the weakest bidding appeared to be for better grades of heavy leaf and some low lugs.

The Eastern Dark Fired Tobacco Growers Association was really on the floors. A majority of the grades went at only 50 Cents to $2 above the Association's floor price. Records show that the association got somewhere near 40 per cent of the offerings.

What The Oil Industry Is Doing

Some time ago a committee representing the oil industry inaugurated a concentrated campaign to gain the cooperation of the American public in the conservation of petroleum products, and, at the same time, to obtain a better understanding of the industry's efforts to deal with unprecedented demand.

That is all to the good. Even in the "tight" areas, the margin between supply and demand of most oil products is small, and reasonable care on the part of industrial and domestic consumers will assure sufficient petroleum for all needs.

For its own information, the public should know what the industry has been and is doing to serve it—and should understand the problems involved. The war prevented much construction of facilities for the production of oil for civilian use. Many of the plants built in war time were designed for special purpose military fuels and lubricants, and are of small value now. The manufacture of materials needed for postwar expansion of the industry has often been behind schedule, due to strikes and other causes. And, finally, it has been necessary to ship considerable quantities of petroleum products abroad.

The oil industry is dealing with the problem on all fronts. It is making peak utilization of every facility it has. It is building new plants as swiftly as it can. It is seeking new sources of crude in every likely area. And, in order to relieve the strain on domestic resources, it is developing foreign oil fields to serve Europe and other parts of the world. It has done a remarkable job in meeting our needs during a long period of stress and strain.

An authority on children recently declared that if every child in the nation had a dog to love, and be loved by, there would hardly be a juvenile delinquency problem.

Plain Talk On Oil

The American Petroleum Institute has published a booklet which explains some of the facts of life as they apply to oil.

Our thirst for oil has attained almost incredible dimensions. America alone consumes more of it than was required by the entire world only ten years ago. The peak reached in wartime was below the present level. And the United States is consuming 28 times as much oil per person as the rest of the world.

The industry, recognizing its obligations, is engaged in a $4,000,000,000 expansion program which is going forward as rapidly as the necessary materials can be obtained. It has managed to build up oil reserves to a new high level—a remarkable achievement in the light of consumption figures. And, finally, it is developing foreign oil resources which will ultimately relieve much of the pressure on our domestic facilities.

There hasn't been a severe oil shortage—which is a testimonial to prior planning by the companies in the "tight" areas. Reasonable conservation by the using public will prevent a shortage in the future. The public is asked, for example, to keep room temperatures in homes using oil heat to 68 degrees, and to resist the urge to speed in automobiles.

All the indications are that the demand for oil will continue to rise. And the industry is expanding daily to carry the load.

Money To Burn

During 1947, fire waste hit its all-time high in this country. In the course of the year, there were 33 conflagrations — the term the fire insurance underwriters apply to blazes involving a property loss of $1,000,000 or more. Those 33 fires alone destroyed more than $100,000,000 worth of property. But this was less than one-sixth of the $624,000,000 total loss. No wonder Europe thinks we have money to burn.

It is widely believed that great fires are confined to large centers of population and the major industrial areas. But that isn't true. One-third of last year's conflagrations occurred in towns with 10,000 population or less. More and more high-value properties are moving out of the metropolises and into the country.

That presents the towns and industries of the nation with a real problem—and a problem that demands quick action. In many cases, fire departments and related facilities are completely inadequate to handle the job. In other instances, industrial and home maintenance has been poor. Finally, according to Business Week, there hasn't been enough attention to safety in the use of new industrial processes and materials.

These are basic causes of big fires and of little fires as well. Every one of them can be cured if communities, home owners and the managers and workers in industry will do their part. We can make America safe from the horrible menace of fire—but we can't do it by talking. It will take work and thought, and the time for starting is now.

Farmers Halt Wind Erosion

The white and colored farmers of Mississippi County, Ark., are planting 120,000 locuts trees in establishing 100 miles of additional shelterbelts to help halt wind erosion, reports the Arkansas State Extension Service.

Other practices being followed in the county to help maintain and build up the fertility of the soil include the seeding of more small grain crops, the sowing of winter legumes, and improving farm drainage. Last year farmers in the county earned more than $300,000 in conservation payments. This was about $50,000 in excess of the allotment for the county.

Camp Fire Girls Campaign For Home

New York—Determined to push forward with their program of health and character building, over 360,000 Camp Fire Girls, Negro and white, throughout the country are helping to raise $225,000 needed for the purchase of their national headquarters at 16 East 48th Street, it was reported this week

Differing somewhat from Girl Scouts, the Camp Fire Girls emprasize home-making and other activities around home life in order to perpetuate the spiritual needs of the home, at the same time stimulating healthful living.

Officers of the organization, with the National, Recreational and Educational Departments, moved into the newly acquired National Headquarters on the first of the year.

Organized in 1910 at the Sebago, Maine Camp of its founder, the late Dr and Mrs. Luther Halsey Gulick, the group had its first headquarters in the Gulick's New York apartment. The organization is now nation-wide.

Their 1948 Birthday Projeet is called "Hello, World: Let's Get Together." They want to get acquainted with girls in other countries, as well as with their neighbors and families. The program calls for communication with people of foreign lands by radio, telephone, the press, movies and television.

Camp Fire provides opportunities for enjoyable, worth-while aetivities for the leisure time of the young girls, and no distinction is made as to race or economic condition. Black and white, rich and poor, participate in the Camp Fire Girl's program.

Make The Farms Hum

By Grace Armstrong Allen

Brrr-rrr-rrr! They say all this snow is good for the soil and the crops. Well, it won't hurt the bees, either; that is, just the snow. Heaped all around and over the hives, it protects them from wind and acts more or less like insulation; and, being porous, it lets air in at the entrance. But if it melts during the day just enough to fill the entrance with slush, and then that freezes during the night, that may be a very bad indeed.

Continued cold is another question. Of course they are now in their winter cluster and a pretty tight one it has been with the thermometer flirting with zero. It is supposed that the cluster has to loosen a bit for the bees to be able to inch up, or to one side, to contact more honey, as they exhaust the stores within reach.

Another winter consideration is the eleansing flight. We have had the rather bad habit of boasting that our bees are seldom confined to their hives longer than two weeks. How January must have laughed at us. I am writing this on the 29th and I doubt if Davidson County bees have had a flight since New Year's Day.

However, we refuse to worry; I mean, seriously. If we were willing to, we could find additional reason in the lack of aster last fall. Although brood was reared at that time, perhaps there was not so much as would have resulted from a good fall flow. And young bees—lots of them are downright essential for good wintering.

HERE AND THERE

INDIAN LEGEND

It is a fact that certain North American Indians were in the habit, when possible, of burying a dead dog with the remains of a child for the touching reason that the child might not be able to find its way in the realm of the spirits, but that the dog, which can always find its way home, will lead it along the right path.—SIR BERTRAM WINDLE.

We should remember in our dealings with animals that they are a sacred trust to us from our Heavenly Father. They are dumb and cannot speak for themselves.

—HARRIETT BEECHER STOWE.

USDA Laboratory Finds New Way To Protect Cotton Fabric Against Rot

The best means yet discovered for protecting cotton fabric and yarn from mildew and other forms of rot is to convert part of the fiber chemically to celllose acetate, similar to acetate rayon, reports the Southern Regional Laboratory of the U. S. Department of Agriculture.

Tcsts at the laboratory have shown that no other rot-proofing treatment gives as much resistance against the various rotting organisms which cause serious losses each year of products made with cotton, especially those subject to dampness and water.

Treated cotton bags arc now being manufactured for water-softening systems, where they hold softeners in tanks of circulating water. Untreated bags rot within a month or less, while thosc madc from partially acetylated cloth remain in good condition for more than a year.

Fish nets and shoe lining cloth of treated cotton are now being tested commercially. Other promising uses are: Tents, awnings, tarpaulins, seedbed covers, and other outdoor fabrics. Other uscs include bags for fruits and vegetables, thread for shoes and other leather or for outdoor fabrics.

A. Phillip Randolph Makes Plea For Children Overseas

New York,— A. Philip Randolph, President of thc Brotherhood of Sleeping Car Porters, madc a strong aid for relief and rehabilitation of children overseas, in support of the American Overseas Aid - United Nations Appeal for Children, which was launched on a world-wide basis last week.

"The crics of the children overseas for relicf and rehabilitaion is of profound humanitarian significance and should meet with liberal response from all Americans without regard to racc, creed, color or national origin," the labor leader dcclared.

"It is unthinkablc that any of us who have the milk of human kindness in our hearts would fail to contribute our money, time and cooperation to prevent hunger and starvation among children overseas."

The Unitcd States is asked to conribute $60,000,000 as its goal in the worldwide drive to give food, clothing and other necessary supplies to the young victims in the war-torn countries of the world, including colonial territories.

At the same time William Green and Philip Murray, Presidents of the A. F. of L. and the CIO respectively, urged suport of the campaign. Contributions will be converted into urgently needed milk, food, vitamins, medicines and clothing.

The drive of the American Overseas Aid-United Nations Appeal for Children is popularly called the "Crusade for Children." Its slogan is "Save a Child—Save the Future." Launching the drive from the United Nations Headquarters, Secretary General Trygve Lie asked that as many persons as possible contribute a day's pay and named Feb. 29th as the extra day of the year which can be used for this purpose.

There are five Negro members of the Board of Directors of the American Overseas Aid-United Nations Appeal for Children. They are: Mrs. Jesse L. Vann of Pittsburgh, Pa.; Dr. Charles S. Johnson, President of Fisk University; Dr. Thomas M. Campbell of Tuskegee Institute; Dr. Eva C. Mitchell of Hampton Institute; and J. E. Stamps of Chicago, Illinois.

"I hope that the common people who know what suffering and sacrifice mean, will give generously of their means to this worthy cause," said Randolph.

27 Million Placements Made By USDA Farm Labor Program

More than 27 million individual placemnts of agricultural workers were arranged under the U. S. Deplacements of agricultural workers farm labor program, Secretary of Agriculture Clinton P. Anderson said last week in summarizing the achievements of the recently concluded USDA recruiting service.

Active operation of the USDA program was ended December 31. Recruitment of domestic farm labor has been returned to the United Statcs Employment Service and recruitment of foreign labor has been discontinued, as well as all USDA operation of migratory labor camps.

"This large and mobile .labor forcc played a vital role in keeping wartime farm production at rccord levels," said Secretary Anderson. "In many areas, it meant the differcnce between harvesting and not harvesting crops. The record speaks for itself," continucd the Scrretary.

Between 1942 and last year, 320,000 agricultural workers were brought here from other countries to help meet the farm labor shortage. These workers camc principally from Mexico, Canada, Newfoundland, Jamaica, the Bahamas, and other Carribean areas.

In addition to the foreign workers brought into the country under the recruitment program, other special groups were made available for farm work through the cooperation of the War Department and other agencies. Those special groups included 382,000 German and Italian prisoners of war, 9,278 Japanese evacuecs, and 2,980 conscientious objectors.

The more than 27 million individual farm placements which were made during the program included 16,608,000 men, 3,631,000 women, and 6.474,000 youth. And 275 migratory camps were maintained for 150,000 workers in peak years of thc program. In addition to housing and feeding workers, medical facilitics werc establishcd to care for the health of migratory foreign and domcstic workers.

Heart Disease No. 1 Killer

New York—How's your heart? Do you know that heart disease is the Number 1 Killer of Americans, including Negroes? This fact is pointed out this week by the American Heart Association, as it launched its nation-wide educational campaign and fund drive.

Contrary to the popular bclief today that tuberculosis is the cause of the highest number of deaths among Negroes, statistics reveal that diseases of the heart rank at the top of the Grim Reaper's list.

Since 1928 heart disease has killed more Negroes than any other disease, says the recognized Negro medical authority. Dr. Herman Julian Lewis, Associate Professor of Pathology, University of Chicago, in his book "The Biology of the Negro." This has been true for white people since 1912, he states. Before hcart disease became the leading cause of death, tuberculosis ranked first for both races.

According to Florence Murray's Negro Handbook, 26,978 Negroes died from heart diseases in 1938, 32,737 in 1941 and 34,173 in 1943. The ratio of Negro deaths to the total is approximately the same as their ratio in the population, one-tenth.

You can help fight heart disease by contributing to the local heart chapter of the American Heart Association in your city. The Association, founded in 1922, is the only national organization exclusively devoted to fighting heart disease through organized scientific and educational work.

Opportunity should be taken to utilize post material when clearing new ground or thinning young stands of pine to obtain better growth.

To Save Money This Year Plant Potatoes In Garden

By DR. FLOYD BRALLIAR
Garden Editor

The Nashville Tennessean

Potatoes are the most widely used of all vegetables. The ordinary family spends more money for them than for any other dozen varieties of vegetables, and for the last few years potatoes have been high priced.

We have not usually urged people to grow potatoes in the family garden, especially in the city garden, because we have found that to do so might crowd out other vegetables that are hard to buy.

This year we recommend every gardner who has the room, to plant at least a few potatoes. By doing this, we can actually save a good many dollar's without using too much land. For there are several important vegetables that can be grown as a second crop to follow potatoes.

About 200 bushels of No. 1 marketable potatoes an acre are considered a good yield in Tennessee. But this past year wc saw potatoes planted in rich soil at the proper time, well fertilized and well cultivated, and kept free from insects, that were yielding 400 bushels to the acre. Two hundred bushels to the acre means a bushel and a peck of first class potatoes from a squore rod. And a bushel and a peck of good potatoes means all the average family will use for six weeks or two months, and it also means a saving of about five dollars in cash.

The usual practice is to plant eight bushels of seed potatoes an acre of 160 square rods, or one bushel to 20 square rods which means three pounds to the square rod. And at retail prices this would not mean more than 25 cents for enough seed to plant a square rod.

The best potato growers use from 600 to 800 pounds of a high grade commercial fertilizer to an acre of potatoes. This means about five pounds to the square rod. This will cost less than 25 cents, leaving $4.50 for planting and growing a square rod of potatoes.

Cool Weather Crop

Potatoes are a cool weather crop, and so should be planted in time o mature early in July. For this reason it pays in Middle Tennessee to plant only early varieties. Probably Irish Cobbler and Triumph are the only two varieties that should be recommended for planting by the ordinary gardner.

Some authorities urge that potatoes be planted in January or February if possible. We have never seen any advantage in so doing and often cold damp winter weather causes much of the seed to rot, therefore we do not get a good stand from this early planting. For Middle Tennessee we believe that any time in March or even the first week in April is the best time to plant potatoes.

At least a week or 10 days and probably longer than this before we intend to plant potatoes, the soil should be turned either by plowing or spading to a depth of eight or 10 inches. When we are ready to plant, make furrows for the rows about 30 inches apart and at least four or five inches deep. Potatoes are not strong rooters. Therefore the roots penetrate deeper and the potatoes produce a better yield if they have two or three inches of loose ground under them.

Fertilizer on Rows

It is better to make furrows an inch and a half or two inches deeper than you expect to plant potatoes. Spread fertilizer in the bottom of these rows and cover it an inch and a half or two inches deep before dropping the seed potatoes. Cover the seed a little more than two inches deep, and in about a week or 10 days, rake the surface of the soil level. This of course finishes filling the furrows, but it does more than this. It destroys all weeds that have either half come up before the potatoes would have. By doing this it is easy to keep potatoes free from weeds and well cultivated.

If you are short of ground in the garden plant a row of radishes, a row of leaf lettuce, or a row of smooth-leafed kale half way between the rows of potatoes when you rake the ground level. This will in no way interfere with the growth of the potatoes and these crops can be harvested before the potatoes need all the room.

Clean Out Beds, Order Seed; Planting Time Almost Here

By DR. FYOLD BRALLIAR
Garden Editor

The Nashville Tennessean

Even though it might be snowing and cold, this is the time to begin getting ready for a real garden.

Clean out the hot beds and cold beds and see that they are in good condition for within a week or ten days we should begin planting in them. Of course we should not sow tomato seed, peppers, or eggplant at this early date, but we should plant our early cabbage and cauliflower, if we plan to grow any, and broccoli for the first early crop. If we wish to grow our own onion plants to set out later they should be planted at once.

Better spray the hot beds and cold frames with some good strong disinfectant as soon as you get them cleaned up. Thus we shall get rid of millions of bacteria and spores that might cause disease in the plant bed as soon as the new crop comes up.

Replace Broken Glass

Be surc that all broken glass in the hot bed sash is removed and replaced with good ones. Sash that has not been used for months is replaced with good glass. Sashes that have not been used for months are usually covered with dust and other similar material so the glass needs washing. Usually turning the hose on them is all that is necessary except in the few worst places. We shall need all of thc light we can get as soon as we plant our seed and soiled glasses do not permit the full-light of the sun to pass through.

The next of equal importance is the planning of the garden. We mentioned this sometimes ago but in view of the fact that it is the usual practice, though not the intention, of the majority of would-be gardners to put off drawing of plans as long as possible, and end up by not drawing any at all. we urge it again. If you have not already drawn the plans for your garden, do so at once, and make a plan that you can keep over for next year. No one can know either the kinds of the quantities of seeds he should buy until hc has worked out his plan.

Shortage of Seed

There is a great shortage of seed this year and seed should be ordered soon.

Disease and insects that destroy one kind of crop usually confine their ravages to that particular crop. The germs that produce disease usually remain over winter in the soil where the crop is grown. They cannot move themselves but they lie in the soil ready to attack any plants that may be set in the same place that similar plants grew last year. For this reason no members of the cabbage family should be planted within 10 or 15 feet of where any members of this family grew last year if it is possible to avoid doing so. In other words rotation of crops in the garden is even more vital than in the field.

During the 12 years from 1934 to 1946, the total of government subsidies to the 48 states and to agriculture and business amounted to 43 million dollars. This is the fantastic picture of Washington paternalism as cited to Congress by Senator Byrd, chairman of the Joint Congressional Economy Committee.

Pointing out that acceptancc of Federal grants causes unwarranted expansion of existing services and launches new projects by State and local governments, the New Jersey Taxpayers Association says: "Federal grants-in-aid represent the most extravagant kind of government finance."—Telegram, Hackensack, N. J.

Watch Open Flame Heaters

According to engineers of the National Board of Fire Underwriters, emergency operation of unvented open flame gas and oil heaters brings a serious hazard to life in the home. If a house is tightly closed or a room is small, the oxygen present is gradually burned us, and the products of combustion develop dangerously high percentages of deadly carbon monoxide. The combination of toxic carbon monoxide and the asphyxiation produced by inadequate oxygen may result in a drowsy, painless death.

Inasmuch as these heaters are frequently used to implement regular heating systems, three safety rules suggested by the National Board should be known to every householder. First the doors to individual rooms in which the heaters are burning should not be closed. Second, the heaters should never be left burning upon retiring for the night. Finally, the heaters should not be used as the permanent or sole source of heat for habitable rooms.

Smoke issuing from any open flame heater is a danger signal—it indicates a deficiency of oxygen, or a dirty or badly-adjusted burner. A number of deaths were caused by the heaters during recent cold spells, and knowledge and caution in the home can prevent a repitition of these tragedies. Don't take a chance.

Four-Legged Doctors

By Carroll Mayers

Call the veterinarian! That is our first thought when sickness and pain strike our pet dog or cat or other animal friend. We want competent medical help for such suffering creatures—and we see that we get it.

But have you evcr considered how these very same creaturcs nurse themselves and their kin in thcir own animal world? Mother Nature has gifted her children with a fascinating intelligencc to care for and cure themselves.

Sick dogs, if left to themselves, will instinctively seek out and eat certain weeds or grasses with medicinal properties. Cat-nip is an aromatic herb which appeals to cats at all times, but when ill, cats wil lhunt for this plant for its ability to cure.

Sheep, cows, goats and deer will also doctor themselves by eating herbs with curative powers.

When we are troubled by sore or weak eyes, our own doctor will often prescribe dark glasses. When our animal friends are so afflicted, they instinctively keep in the shadow, or avoid bright sunlight by covering their eyes with their paws.

We soothe cuts and scratches with salves and medical ointments. Deer will endeavor to cover such wounds with downy spruce resin. Bears use soft clay or gum. Hogs wallow in the mud to stop the flow of blood, and horses will ease their hurts by licking each other.

Just as we resort to amputation only as a last resort, so does the animal world. But a fox will not hesitate to completely gnaw off a sorc limb when other methods of treatment fail. Afterwards, the wound is licked, bathed in a cool spring, and anointed with gum. Raccoons, beavers and muskrats also follow this course.

Man has adopted medical treatments which have been used instinctively by the animal kingdom for centuries. In treating rheumatism, for example, we flock to mineral spring resorts, and undergo many varieties of heat application. Deer and cattle so stricken will bathe in sulphur springs, or lie down in the warmest possible sunlight. Often, their recovery is as complete as the cure we attempt to bring ourselves by "modern" methods.

It is a good practice to rotate your garden plot just as you do your field crops.

Lettuce Ranks Next To Top As Popular Garden Crop

By Dr. Floyd Brailliar
Garden Editor
The Nashville Tennessean

Lettuce is second in popularity of all vegetables grown. Yet we could well use twice as much if we had it, and there is no reason why any one should not have all the lettuce he can use, if he has a garden, from early spring to the last of May and again through Oetober and November.

Lettuce is a cold weather crop though it will be killed by hard freezes. Only Black Seeded Simpson and one or two other varieties will live through zero weather.

There are two distince types of lettuce eommonly grown. The loose-leafed varieties, and the hard-heading varieties. For health's sake and for good flavor, the loose-leafed varieties are much to be preferred. But fashion decrees that head lettuce is more stylish to use.

Lettuce requires a decidedly rich soil that is reasonably loose and rich for eight or ten inches if it is to do its best, for it naturally roots very deep as well as spreads fine roots near the surface.

Sow leaf lettuce where it is to grow about March 10 and as soon as it is large enough begin thinning it. When cutting it for table use leave a plant undisturbed about every five inches apart in every direction. Give these plants a pinch of good nitrate fertilizer and by the time all the patch is thinned in this way, these plants will be beginning to crowd each other. Now thin again, leaving a plant every 10 inches. These will soon be large enough to touch each other and the middle of thc plant will be bleached almost white. When the plants reach this stage they must be used promptly or they will go to seed

Start in Hot Bed

Head lettuce may be grown in exactly the same way, but it usually pays to start head lettuce in a window, a hot bed or a cold frame and set the plants in the open ground about April 1 and give them a pinch of fertilizer a week after they are set, a level teaspoonful two weeks later, and again in another week.. In all cases this fertilizer must be at least two inchcs away from the plant and should be worked into the top inch of the soil

For loose-leaf we prefer Black Seeded Simpson, Bronze Beauty, and Slobolt We are more sure to get good heads from the following varieties: Wayahead, Great Lakes, Bibb and White Boston. In flavor we personally like Wayahead and Bibb better than other lettuces either used for loosed leafed thinnings or as heads

Are Farmers As Well Off As City Folks?

Washington, Feb. 2—(UP)—A representative of the National Cooperative Milk Producers Federation recently called for modernizing the method of determining whether farmers are as well off as city people.

Louis F. Hermann, federation economist, said statistical tools have been perfected steadily since the nation started measuring the relative welfare of farm and nonfarm people nearly 25 years ago. Herrmann testified before the House Agriculture Committee, which is studying a long-range farm program.

He said the present "parity index," which determines the economic welfare of farmers eompared to others, takes into account only the prices of farm produets and of the things farmers buy. Factors such as the quantities of products raised, the changing types of materials used in their production and varying quantities of needed concumer goods also should affect the index' he said.

The level of farm prices should reflect an average net income per hour of work equal to the average hourly earnings of industrial workers, he testified.

Fresh Vegetables Necessary To Supply Vital Minerals

By Dr. Floyd Bralliar
Garden Editor
The Nashville Tennessean

I am often asked why we need to eat vegetables freely rather than subsist on more concentrated foods. There are threc reasons.

Thc human body as well as the bodies of all animals must have a steady supply of minerals, not only to build up and keep the bones strong and in good health, but to provide necessary building blocks for the other tissues and there is no other source of these matcrials that equals fresh vegetables.

We must have calcium and phosphorous to build good bones and teeth. Iron is rcquired to make good rcd blood. Without it wc would have no hemoglobin in the blood cells and so could carry no oxygen to the body cells. The green coloring matter in leaves and grecn stems is the best known source of iron for the blood, henee the importance of eating the leafy vegetables, the so-called greens. Nothing wc can take out of a bottle is so valuable as greens to supply iron to the body.

Necessary to Health

Potassium and sodium together with sulfur and a little iodine are absolutely necessary to the maintainance of a healthy body. Fresh vegetables, especially leafy vegetables and snap beans are the best sources of these minerals. In fact all vegetables are rich in these elements.

Then there are the vitamins, those mysterious elements that make it possible for the body to make use of these minerals. Vegetables are excellent sources of five out of six of the known vitamins, so necessary to health. Perhaps we should discuss the source and the work of these vitamins.

Vitamin A might be ealled the general body regulator. It helps thc old and the young alike to keep in good condition. It is a growth regulator; is a necessity in the maintenance of good eyesight, especially at night and fortifies the body against several diseases.

Provides Vitamin A

Excellent sources of this vitamin arc turnip tops, tampala, kale, collards, Brussels sprouts, leaf lettuce, carrots, sweet potatoes, yellow squash, green snop beans, okra, spin ach, green peas, peppers, (sweet), tomatoes, mustard greens, and broccoli, parsley, beet greens and ehard, and unbleached asparagus. The sooner these are cooked and eaten after they are brought from the garden the better.

Vitamin B is really a combination of several vitamins so it is often referred to as the B complex. It is often called the runger vitamin for if the supply in the ration runs low, there is a lack of appetite. Children especially eat little because they are not hungry. As a result of the lack of vitamin B, we become sluggish, irritable and lose interest in things in general. If the lack continues, beriberi develops. This vitamin promotes growth. aids digestion, and combats constipation, and prevents eertain nervous and heart diseases. White milk, eggs, whole wheat, and whole oat preparations are the best sources of this vitamin, the following garden vegetables are excellent: ripe peas and beans. collards, kale, turniptops, cabbage, sweet potatoes, carrots, mustard, greens, okra, tampala, beet greens and unbleaehed asparagus.

Anti-Scurvy Vitamin

Vitamin C is the anti-scurvy vitamin. Few people in this country are likely to have such an acute form of defieieney in vitamin C but many people do lose their appetite and weight and feel tired think they have rheumatism, and visit the dentist oftener than they think they should have to. All of these signs point to the laek of vitamin C. Many people think of orange juice as the sole source of vitamin C, but a double order of tomato juice will do the same trick. Other excellent sources are turnips, turnip greens, cabbage, collards, spinach, cauliflower, peas, radishes. asparagus, Brusels sprouts and parsley.

Vitamin E, the "anti-sterility vitamin comes in sufficient amounts along with any diet which is otherwise adequate in green vegetables and whole grains.

Vitamin G, famous in the study of pellagra, helps to keep us well at all ages. It prevents the slowing-up growth, loss of weight, and too early signs of old age. Excellent sources among the vegetable kingdom are turnips, kale and beet tops. Good sources arc collards, cabbage, spinach, green lettuce, carrots, beets, cauliflower, and broccoli. The color sign applies to vitamin G, as well as Vitamin A. The nutrition experts in the bureau of home economics say that a rich green colored vegetable is likely to be just about twice as rich in Vitamin G as the same vegetable bleached.

FARMS OF NONWHITE FARM OPERATORS, NUMBER OF FARMS, LAND IN FARMS, CROPLAND HARVESTED, AND VALUE OF LAND AND BUILDINGS, BY TENURE: CENSUSES OF 1945 AND 1940

Final Figures: South Carolina

In the State of South Carolina, the total number of nonwhite-operated farms rose from 61,307 to 69,136, or almost 13 percent (12.8 percent) between April 1, 1940, and January 1, 1945, according to final figures from the 1945 Census of Agriculture released today by Director J. C. Capt of the Bureau of the Census The gain of 7,829 in the total number of nonwhite-operated farms during the approximate 5-year period. April 1, 1940, to January 1, 1945, reflects an increase from 17,084 to 17,963 in the number of owner operated farms, a decrease from 29 to 18 in the number of managed farms, and an increase from 44,194 to 51,155 in the number of tenant farms.

As shown by Census of Agriculture data, the gain of 6,961 or 15.8 percent, in the number of nonwhite tenant farms in the 5 years, 1940 to 1945, represents a pronounced change in the growth of tenancy among nonwhite farm operators in the state of South Carolina. In the period, 1920 to 1940, there was a steady decline in the number of farms with nonwhite tenants. Quinquennial decreases in number of nonwhite tenant farms in the 20 years, 1920 to 1940, were 13,889, 10,817, 3,238, and 13,930. As a result of these decreases, the total nunıber of nonwhite tenant farms in South Carolina in 1940 was 41,874, or nearly 50 percent (48.7 percent), below the total of 86,068.

The increases in the number of farms operated by nonwhite owners and tenants between 1940 and 1945,refleced, in a large measure, favorable changes in farm income, the purchase of farms under the provisions of the Bankhead-Jones Farm Tenant Act, and an enlargement in the number of opportunities for nonwhite males as tenant farmers. These factors are also reflected in the increases in acreage, cropland harvested, and value of land and buildings which in most instances accompanied the increases in number of farms.

Land in all nonwhite-operated farms in 1945 was 36,793 acres, or 1.3 percent, above the 1940 total of 2,781,837 acres The change in acreage in owner-operated farms between 940 and 1945 was markedly different from the change in acreage in managed and tenant farms. Land in owner-operated farms rose from 799,206 acres to 877,335 acres, or 9.8 percent,while land in managed and tenant farms declined from 1,982.631 acres to 1,941,295 acres, or 2.1 percent.

In the 5 years, 1939 to 1944, eropland harvested on nonwhite-operated farms rose from 1,414,824 acres to 1,556,196 acres for an increase of 141,372 acres (10.0 pereent). To this gain, farms of tenants eontributed the largest number of acres (110,995) and farms of managers, the smallest number of acres (306). On owner-operated farms, the gain in cropland hearvested was 30,071 acres. This represented an increase from 336,808 acres in 1939 to 366,879 acres in 1944.

As compared with 1940, the total value of land and buildings of nonwhite-operated farms in 1945 ($109,957, 778) represents an increase of $32,898,447 (42.7 percent). The largest part of this increase—$22,692,569, or 69.0 percent—was for tenant farms, and the next largest part—$10,050,548, or 30.6 percent—was for owner-operated farms.

For the 46 counties in the State of South Carolina, the number of farms with nonwhite farm operators in 1945 ranged from 283 in Pickens County to 4,373 in Orangeburg, County. Somewhat more than one-half of the farms (50.8 percent), however, were in the 15 counties of Aiken, Anderson, Clarendon, Darlington, Dillon, Florence,, Horry, Laurens, Lee, Marlboro, Orangeburg, Spartanburg, Sumter, Williamsburg, and York. These counties had 56.5 percent of the nonwhite tenant farms, 46.7 percent of the land in nonwhite-operated farms. 54.0 percent of the cropland hearvested, and 57.7 percent of the value of land and buildings.

In number of nonwhite owner-operated farms, Berkeley County, with 1,316, ranked first. Williamsburg County, with 1,137, ranked second, and Charleston County, with 1,131, ranked third. The 3,584 owner-operated farms in these counties represented one-fifth (20.0 percent) of the total number of nonwhite owner-operated farms in the State.

Table I presents statistics from the 1945 and 1940 Censuses of Agriculture which show acreage, value of land and buildings, and cropland harvested on farms of nonwhite farm operators, by tenurc, for the State of South Carolina. Table 2 shows acreage and value of land and buildings in 1945 and 1940, and cropland harvested in 1944, for farms of nonwhite farm operators in the State of South Carolina, by counties.

The term "nonwhite" includes Negroes, Indian, Chinese, Japanese, and other nonwhite races, but nearly all of the nonwhite farm operators in the State of South Carolina are of the Negro race.

A "farm operator," according to the census definition, is a person who operates a farm, either performing the labor himself, or directly supervising it. Full owners own all of the land they operate. Part owners own a part and rent from others the rest of the land they operate. Managers operate farms for others and receive wages or salaries for their services. Persons aeting merely as caretakers or hired laborers are not classified as managers. Tenant operators hire or rent land only. Croppers are tenants who pay a share only of either crop or livestock their landlord furnishes all the work animals or tractor power.

Home-Made Hominy Becoming Legend, But Not In Kentucky

By Mrs. Aubrey Hinton

Making hominy in the home is becoming a legend in many communities, but here in Allen County, Ky.. we still consider it one of our choice dishes at this time of the year Home-made hominy with fresh pork ribs or back bones or with aged country sausage is a delight for every member of the family

While there are many recipes for making hominy, most of us have found one we called "Aunt Annie's" the most desirable. It is a simple one and easily followed.

Fill a seven-by-nine inch muslin bag about two-thirds full of wood ashes from the stove and sew up the open end of the bag. The bag of ashes is plaeed in the bottom of an iron kettle. Corn from four large ears (hickory king preferably) is poured into the kettle on top of the bag of ashes. Cover eontents of the kettle with water and boil for about one hour or until the skin on the corn will slip off.

Dip corn from kettle and pour in pan of fresh cold water. Wash corn through fingers until all skins are removed Separate kernels and skins by continuous washing

Place clean kernels in kettle, cover with water and cook until tender. Drain off water and salt to taste. Homemade hominy will keep for several days if kept cool. Some can it—using the water-bath method.

Before salting the cooked corn, put it in clean jars adding one teaspoon of salt to each quart. Screw on caps and process in water bath for a couple of hours. It will keep just like any other canned product.

Virginia Holstein Becomes Highest Producer In U. S.

Taking her place with the great Holstein-Friesian cows of past and present, Pinelee Poseh Millie Girl 2153759, owned by Charles R. Hope and Son, Purcelville, Va., recently beeame the highest milk-producing living cow in the United States today being milked three times daily.

"Millie" completed her 365-day test with an official record of 32,765 pounds of milk and 1120.2 pounds of butterfat, the second highest 3X milk record in U. S. dairy history, surpassed only by Mountain Maid Ruth Battles Tietje, owned by Archie Allison, Cheyenne, Wyoming, who produced 34,004 pounds of milk and 945.4 pounds of fat in 1934. (Translated into quarts, "Millie" produced enough milk to supply 22 families with two quarts a day every day for a year.)

"Millie's" record makes her the highest-producing Holstein cow in history for both milk and fat south of the Potomac, regardless of number of times milked. In addition she now holds the distinction of being the fourth cow in the U. S. ever to produce 32,000 pounds of milk being milked three times a day.

6,000 Southern Rural Consumers To Benefit By Recent REA Loans

Six thousand Southern rural consumers, homes. schools, ehurches, and businesses—will benefit by loans made last week to 15 borrowers in the South by the Rural Electrifieation Administration, the U. S. Department of Agriculture reports.

The loans, totaling $4,446,000, will provide for the construetion of 1,929 miles of additional electrie lines to carry power to white and colored farm people in parts of eight Southern States. States in which the loans were made are: Alabama, Georgia, Louisiana, Mississippi, North Carolina, Oklahoma, South Carolina, and Texas.

During this fiscal year which ends June 30, REA is authorized to lend $225,000,000 for the extension of electric service. It is expected that these funds will make it possible to serve about 400,000 more rural consumers throughout the country. Approximately 2,285,000 farms were without central station electric service last July 1. Of these 1,475,000 or 64 per cent were in the South.

However, since the REA program was launched in 1935, the number of farms with central station electric service has increased from only 750,000 to almost 3,500,000. Today, about half of the farms in the South have eleetric service and for the Nation as a whole, 61 percent of the farms are electrified.

During early December, REA lines reached their 2,000,000th consumer. About 1,5000,000 rural consumers are serviced by privately financed power eompanies. On the occasion that the 2,000,000th consumer was connected, Administrator Claude R. Wiekard said, "We commemorate this milestone knowing that there are many others who still want and need electric power for modern living."

WOMAN'S PAGE

KITCHEN HINTS

Waxed butter cartons make excellent containers for ice-box cookie dough.

Pounding meat before cooking it helps to make it tender by softening the connective tissue.

A good general rule in stuffing a chicken or duck is to allow 3 cups of fresh bread crumbs for a 4-pound bird; 4 cups for a 5-pound bird.

When hanging up the family wash, set the basket of wet clothes on a table in the yard so you don't have to stoop over to pick up the pieces of laundry. A table mounted on wheels saves even more time and effort.

Add cubes of enriched bread, browned in bacon drippings, along with bits of cooked bacon, to eggs when scrambling. The combination makes good eating while making eggs and bacon go farther.

LEAKAGE TEST

To test for leaks around the refrigerator door close the door on a piece of ordinary wrapping paper about the size and thickness of a dollar bill. If the paper pulls out easily, the gasket is not tight enough to keep warm air from passing into the refrigerator. Tightening hinges or latches may make the door fit more snugly.

Try adding a dash of chili to the cream sauce when you are having creamed fish.

To make dull or tarnished gold jewelry look like new, rub it lightly until bright with a toothbrush that has been dipped in ammonia, then in baking soda.

DIP FOR TIPS

When shoe laces lose their tips, as they often do in children's shoes, twist the ends, dip them in clear nail polish and let them dry. This speedy method of making new tips is suggested by clothing specialists of the U. S. Department of Agriculture.

The same dip can be used to make a stiff tip for cord or heavy thread used in stringing beads.

COOKERY HINTS

In preparing corn pudding, be careful not to overheat the egg-corn mixture. Be sure the water around the pudding does not boil before the custard sets. For quicker cooking you may want to put the pudding into individual custard cups for baking and serving.

For special color touches add some chopped green pepper, parsley or a few strips of pimiento to the pudding. Or place strips of bacon on top and a few dashes of paprika for an appetizing appeal.

CHICKEN CROQUETTES ROYALE

New, easy way to make croquettes—and Blue Plate Mayonnaise gives them delightful flavor.

½ cup Blue Plate Mayonnaise
1 tablespoon finely minced onion
¾ teaspoon salt
Dash of pepper
1 tablespoon Worcestershire sauce
½ cup finely minced celery
2 cups minced cooked chicken (or leftover meat)
1 cup cooked rice or bread crumbs
Dried crumbs to coat croquettes

No need to prepare a white sauce to "bind" your croquettes. Just blend first five ingredients together; then add celery, chicken, and rice. (Spicy, tart Blue Plate Mayonnaise has that wonderful, tempting Blue Plate flavor. It's always fresh, FRESH and creamy.) Shape into croquettes, roll in crumbs, chill half hour or more. Bake in hot oven, 425 degrees F., 20 minutes or until brown, or fry in hot fat. Serves four.

MINESTRONE

¾ pound ground beef
1 teaspoon salt
⅛ teaspoon pepper
4 tablespoons butter or margarine
½ cup chopped onion
4 cups tomato juice or canned tomatoes
2 cups canned peas
½ cup broken macaroni

Season ground beef with salt and pepper ,and form into small balls about an inch in diameter. Brown lightly in butter or margarine. Combine remaining ingredients with meat in saucepan, cover and simmer until macaroni is tender. Taste, and season with additional salt and pepper if desired.

GINGERBREAD WITH PRALINE TOPPING

That old favorite— gingerbread takes on new interest with a luscious praline topping. It's an easy trick, too, when boxed gingerbread mix is used. Mix with water, according to directions, and bake for about 30 minutes; then remove from the oven and spread top with a mixture of 1-3 cup brown sugar, 2 teaspoons cinnamon, 3 tablespoons flour, 3 tablespoons butter and ½ cup chopped pecans. Return to oven and finish baking. Served with sparkling fruit punch, this fancy gingerbread is a perfect party treat.

ROQUEFORT-TOMATO DRESSING

An excellent topping for head lettuce is easy-to-prepare Roquefort-Tomato Dressing. Simply cream ¼ pound Roquefort cheese (Bleu cheese may be used) thoroughly, using a fork; then blend with ¾ cup tomato catsup and 3 heaping tablespoons mayonnaise.

This makes almost a pint of dressing which can be kept in the refrigerator for several days.

APPLE CAKE WITH CHEESE SAUCE

2 cups thinly sliced apples
¾ cup light molasses
½ cup hot water
1-3 cup butter
1 egg
½ cup sugar
2 cups all-purpose flour
1½ teaspoons baking flour
¼ teaspoon salt
½ teaspoon soda
1 teaspoon cinnamon
¼ teaspoon nutmeg

Simmer apples in molasses until tender; cool. Pour water over butter; cool; add egg beaten with the sugar, then the sifted dry ingredients and apple mixture; mix well. Pour into greased 9-inch square pan. Bake at 350 degrees for 40 minutes. Serve warm with Cheese Sauce.

Cheese Sauce

1 package of cream cheese
1tablespoon malosses
¼ teaspoon cinnamon
1 cup confectioner's sugar
Cream

Beat until soft the cheese, molasses and cinnamon. Add gradually the sugar and enough cream to make sauce the right consistency.

ZIPPY LUNCH-TIME SANDWICHES

Real energy food with real "fresh-roasted" peanut flavor of Blue Plate Peanut Butter.

¼ cup Blue Plate Peanut Butter
¼ cup cranberry jelly

Combine Blue Plate Peanut Butter and cranberry jelly. Use as filling for white, whole-wheat, or nut bread sandwiches. Blue Plate rates "tops" with the school-lunch crowd—it's creamy—smooth, with real "fresh-roasted" peanut flavor. (Note to mothers: Blue Plate Peanut Butter is nourishing energy food—high in proteins, provides vitamins too.) Recipe above makes filling for 4 large sandwiches.

YAM, CRANBERRY, ORANGE CASSEROLE

5 medium-size yams
½ cup sugar
2 tablespoons butter or margarine
½ teaspoon salt
¼ cup orange juice
1 tablespoon grated orange rind

Scrub sweet potatoes in cold water with vegetable brush. Put them in a saucepan and add just enough boiling water to cover them. Place lid on saucepan and boil until tender. Drain at once, peel and slice in lengthwise slices or 1-inch crosswise slices. Arrange in casserole. Combine the sugar, butter or margarine, salt, orange juice and half the orange rin gin a small saucepan; bring to a boil, stirring constntly. Pour over yams and bake in a moderate oven (375 degrees), basting if desired, for about 30 minutes, spread cranberry sauce over the yams and sprinkle with remaining orange rind. Bake 10 to 15 minutes longer, just enough to heat cranberries. Adding the cranberries last preserves their bright red color. This makes 6 servings.

SWEET POTATO CROQUETTES

Peel and slice six medium-sized potatoes and cook until tender. Drain and mash. To about 2 cups mashed potatoe and 1 beaten egg, ½ cup cream, 2 tablespoons butter, salt, pepper and a little sugar. Keep mixture stiff enough to handle, shape into croquettes, dip into beaten egg and cracker crumbs twice, chill and fry in deep fat just before serving. This recipe serves six.

In this recipe, the egg may be omitted, the croquettes may be flavored with cinnamon, rolled in cornflakes, and bake in moderate oven until slightly brown.

Speaking of potatoes again, here's an Alabama sweet potato custard recipe that many readers may like to try:

1 cup mashed sweet potatoes
½ cup raisins
¼ cup shredded cocoanut
¼ cup sugar
½ cup milk
1 egg, well beaten
¼ teaspoon vanilla
2 tablespoons butter
½ cup nut meats, if desired.

Mix in order given and bake in pastry crust in moderate oven. This may be served with whipped cream or covered with meringue.

Another potato pie or custard pie or custard—whatever you decide to call it, the flavor is just the same—is this one that comes to me highly recommended:

Half a dozen medium-sized potatoes boiled in slightly salted water and mashed. Add about two tablespoons of butter and half a cup of milk that has been heated. Sprinkle in ½ cup brown sugar, and add a dash of nutmeg. Whip until light, adding more milk or cream if necessary. Pile into baking dish, sprinkle with brown sugar, dot with butter, and bake until lightly brown, 20 to 25 minutes, in moderate oven (about 375 degrees F.). Serve with whipped cream or a favorite sauce.

HOLIDAY SNOWBALLS

⅞ cup margarine
¼ cup confectioners' sugar
1¾ cups sifted all-purpose flour
1 cup finely chopped pecans
2 teaspoons vanilla
1 teaspoon water

Cream margarine and sugar. Stir in remaining ingredients and blend well. Chill dough until firm. Form into balls about 1¼ inches in diameter. Bake on lightly greased cooky sheet in moderately hot oven (400 degrees) 12 to 15 minutes. While still hot roll in sifted confectioner's sugar. Makes 2 dozen.

QUICK-FIX CUES

To shell Brazil nuts quickly, place the nuts in boiling salted water, allowing 1 tablespoon salt to a quart of water. Boil gently 3 minutes; drain and cool, then crack and remove shells. If a toasted flavor is desired, roast the unshelled nuts in a hot oven for about 20 minutes, then cool, crack and shell.

To slice Brazil nuts easily, cover the shelled nuts with cold water and bring slowly to the boiling point; simmer 2 to 3 minutes. The nuts can them be sliced without breaking.

Brazil nuts can be chopped with a French knife on a chopping board if a very coarse cut is desired, but for the greatest variety of uses the coarse cut is desired, but for the greatest variety of uses the coarse blade of a food grinder will give satisfactory and quick results.

TODAY'S TIP ON FOOD SAVING . . . FOR HOMEMAKERS

Macaroni, prepared in a milk and cheese sauce, is an excellent alternate for meat. By itself, macaroni is not a meat alternate but when combined with animal protein like milk or cheese, a macaroni dish replaces meat nutritionally as a main dish in the meal.

When serving sandwiches, remember that the open-face variety is good to eat and good as a bread-saver.

Leftover canned fruit steps up the flavor of a plain vanilla cornstarch pudding. Use the fruit sirup instead of some of the milk and stir it in as the pudding begins to thicken, then add the fruit. Canned cherries, with their sirup, gives the pudding a delicate pink color and a delicious flavor.— Citizens Food Committee.

CARROTS WITH ONIONS

3 cups thinly sliced carrots
1½ cups thinly sliced onions
2 tablespoons chopped green pepper
1 teaspoon salt
½ teaspoon basil
¼ cup water

Place carrots, onions, green pepper, salt and basil in a saucepan; add water. Cover and cook over low heat for 20 minutes or until vegetables are tender. Six servings.

NECTAR-ALMOND PUDDING

1½ cups apricot whole fruit nectar
½ teaspoon salt
1 cup granulated sugar
1 cup ground roasted blanced almonds
4 tablespoons cornstarch
½ cup cold water
2 tablespoons lemon juice
2 egg whites
Whipped cream
Maraschino cherries

Combine nectar, salt, sugar and almonds and bring to a boil over direct heat. Add cornstarch moistened in cold water, stirring briskly. Place over boiling water and cook and stir until very thick. Remove from heat, add lemon juice and stir to blend. Beat into stiffly beaten egg whites, a small portion at a time. Serve cold with whipped cream. Top with maraschino cherries. Serves 6 to 8.

SWEET POTATO TALKS

"Boil and mash the potatoes and place in baking dish. Heat, and just before serving pour the following sauce over the potatoes:

One cup brown sugar, 4 tablespoons cream, 4 tablespoons butter. Boil for two or three minutes, and add ½ cup pecans. If you haven't tried this, I hope you will sometime, and like it."

Then comes another favorite that can be prepared in advance and then cooked quickly when ready to serve.

RICE STUFFING

1-3 cup butter or margarine
¼ cup diced onion
¾ cup diced celery
¾ cup canned mushrooms
3 cups boiled rice
¾ cup diced sweet pickles or sweet pickle relish
½ teaspoon poultry seasoning
Salt and pepper

Melt butter; add onion, celery, and mushrooms and sauce 5 minutes. Combine all ingredients, tossing lightly. Yield: Stuffing for a 5-pound chicken.

VEGETABLE SALAD

A different kind of vegetable slaw is made from 2 cups of raw beets cut in thin strips, 4 cups of raw shredded spinach, 4 tablespoons of French dressing, 1 teaspoon of prepared horseradish, 1 teaspoon of finely grated onion and salt and pepper to taste.

SAFETY TIP

Whether you live in town or the country be sure your child knows how to be careful on the way to and from school. Teach him to look both ways and then, if there's no car coming, to walk, not run across. Remind him that he should cross only at corners. If you live in the country don't forget to tell him to walk only on the left side of the road.

BARBECUED RIBS WITH SAUERKRAUT

Place 3 pounds pork spareribs, meaty side up in a large shallow pan. Sprinkle with ½ teaspoon salt and bake in a hot oven (450 degrees) for 30 minutes. Chop a medium-size onion and mix with a can of condensed tomato soup, 1 teaspoon Worchestershire sauce, ⅛ teaspoon pepper, and 2 tablespoons vinegar. Pour over the ribs. Reduce heat to a moderate oven (350 degrees) and continue to bake for 45 minutes, basting frequently. Remove from pan. pouring sauce into bowl. Spread a No. 2½ can sauerkdaut in pan and place the spareribs on top. Pour sauce over them and put back in oven for 30 minutes or longer, until done. Six to eight servings.

CANAPE SPREAD

To spread enough sardine and egg spread for 36 small canapes, blend ½ cup mashed sardines, ½ cup grated egg yolk, 1 tablespoon lemon juice, ⅛ teaspoon Worcestershire sauce, and 4 teaspoons mayonnaise or salad dressing to form a paste. . Spread on bread cut in desired shapes and garnish with grated egg yolk, strips of pimiento and parsley.

Sweet potato is about as good a source of vitamin C as the tomato, according to studies in progress at the Plant Industry Station, Beltsville, Md.

CRANBERRY-FRUIT MOLDS

1 package lemon gelatin
1 cup boiling water
½ 1-pound canned jellied cranberry sauce
1 apple
½ orange
1 teaspoon lemon juice

Dissolve gelatin in boiling water and chill until it begins to thicken. Crush cranberry sauce. Grind apple and orange, leaving skins on. Combine cranberry sauce with fruits and lemon juice. Add to gelatin. Pour into molds and chill until firm. Serve on lettuce with mayonnaise. Serves 6.

BAKED CROQUETTES

Croquette mixtures may be baked to save frying in deep fat. They should be dipped in beaten egg and crushed potato chips or buttered bread crumbs, then baked to a golden brown in a moderate oven.

Collin Johnson Finds Soil Care Highly Profitable

Champion Farmer Receives Award

Collin Johnson, right, Oklahoma farmer who has increased his cotton yield 500 percent by carrying out sound soil and water conservation practices, is shown receiving a check for $100 from Dr. Banjamin F. Hubert, director of the Association for the Advancement of Negro Country Life. The presentation was made at the recent Log Cabin, Ga., Soil Conservation Jamboree where Johnson was acclaimed the champion soil conservation farmer of Oaklahoma. USDA Photo by Busch

Champion Oklahoma Farmer Increases Cotton Yield More Than 500 Per Cent

Washington, D. C.—"It's just plain dollar-sense to conserve your soil," says Collin Johnson, Oklahoma champion colored farmer who has increased his cotton yield by more than 500 percent by consructing terraces and building up the fertility of his soil.

Six years ago, Mr. Johnson bought a run-down, eroded family-size farm near Hugo, Okla., for $1,500 which most of his neighbors said was a good deal more than the farm was worth. But he had been wanting a farm of his own for a long time and here was his chance, so he took it. His blind enthusiasm over ownership hid from his view many of the defects of the farm.

But when he totaled up his first year's production and found that his cotton yield amounted to only 133 pounds per acre and his corn yield was less than 15 bushels per acre, his enthusiasm was thin enough to see through. He realized that this land was sick. So, he asked his soil conservation district to send out a technician to help him diagnose the ailment of his land and prescribe treatment.

Within a few weeks, a Kiamichi District technician had helped him develop a conservation plan for his farm. It called for replacing the level terraces, which he found on his farm, with graded terraces. The plan also called for planting legumes and cover crops on all his cultivated land, sodding grass, and seeding lespedeza—a hay crop—in his pasture.

On his cultivated acres, Farmer Johnson turned under the legumes and added commerical fertilizer to improve the soil, and keep his terraces in good repair to prevent erosion. By last year, his cotton yield had increased to 857 pounds per acre and his corn yield had

USDA To Help South Improve Quality of Its Dairy Cattle

The U. S. Department of Agriculture has undertaken cattle breeding experiment designed to develop a dairy cow especially adapted to the climatic conditions of the South, says O. E. Reed, chief of the Bureau of Dairy Industry, in his annual report which was released recently.

Reed points out that the extremes of heat and humidity along the Gulf Coast are held responsible to some extent for the low average milk production per cow in this section. So, his agency has set out to develop a breed of dairy cattle with greater heat resistance.

To achieve this goal, the Bureau of Dairy Industry brought four head of Brahamn cattle from India to its Beltsville, Md. station in 1946. The cattle consisted of two sires and two heifers of the Red Sindhi breed a milk producing strain of Brahman cattle. These animals are being crossed with Jerseys. Some of these animals have been sent to the Jeanerette, La., station for further study. There, the scientists will determine the physiological effect of high temperature and humidity on the cattle under experimentation.

Plant 2 Cucumber Crops for Abundance, Says Expert

By Dr. Floyd Bralliar

Cucumbers are considered difficult to grow in Middle Tennessee, but we have found very little trouble in getting a good crop, especially from an early planting and again from a late planting.

We do have trouble in getting the early planting to grow and bear all summer as they do in some climates.

All of the vine crops, such as cucumbers, squashes of all kinds pumpkins, and so forth make roots that spread out just as the vines spread, and these roots grow only a few inches under the surface of the soil. For best results, soil should either be sandy or loose and full of humus. What is commonly known as second year sod, sod that was turned under a year ago, is considered the best soil for any of these crops, and especially for cucumbers and melons.

Plant After Frost Danger

Make your first planting of cucumbers after all danger of frost has passed to supply fruits for summer use, and a second sowing five or six weeks later to furnish cucumbers for fall use and picking. They succeed best in a fertile, light, well-drained soil. Well-rotted manure or organic matter dug into the soil where seeds are to be planted and side-dressings of commericial fertilizer after the plants have begun to grow are beneficial.

Plant in hills four to five apart scattering five or six seeds in each hill, and cover with half an inch of soil. It is important that the seeds be not dropped closer than an inch or so of each other, for as soon as danger of their being killed by bugs is over, and the plants start to make vines, all of the plants should be pulled out except two or three of the most vigorous ones.

HOW TO PLANT

One ounce of seed is sufficient to plant from 60 to 75 hills. In some localities growers plant two or

Sec'y of Agriculture Describes Needs of Low-Income Farm Families

Washington, D. C.—Despite the improvement in agricultural income, about 1,500,000 white and colored farm families are still unable to provide themselves with satisfactory housing, says Secretary of Agriculture Clinton P. Anderson in his annual report to President Truman.

About two million farmhouses need major repairs and another two million need replacing altogether, says the Secretary. He points out that although the recent improve-

(Continued On Page 4 Col. 2)

Million Farmers Aided By Farmers Home Demonstration During Last 12 Years

A million white and colored farm families sharecroppers, tenants, and laborers have been aided by the Farmers Home Administration and its predecessor agencies during the last 12 years, said Information Specialist L. Herbert Henegan in an address before the recent Omega Psi Phi convention in Detroit, Mich.

Henegan, a former newspaperman who has held his present post with Farmers Home for the last six years, told the convention of the

(Continued On Page 4 Col. 4)

Agricultural Employment Declines By Two Million In 40-Year Period

Although 147,000 more persons were employed on farms last year than in 1946, the long-time employment trend shows a decline of two million workers since 1909, reports the Bureau of Agricultural Economics of the U. S. Department of Agriculture.

Average farm employment in 1909 stood at 12,209,000. Of these, 9,341,000 were family workers and 2,868,-

Lack of Live-at-Home Program Forces Sharecroppers To Spend Their Meager Earnings

Washington, D. C.—Although colored sharecroppers receive smaller incomes than do tenant farmers, they spend more of their meager earnings in grocery stores because of their lack of opportunities to produce more of their own food at home, a recent preliminary report of the U. S. Department of Agriculture reveals.

The report, which is based on a survey made by the Bureau of Human Nutrition and Home Economics in cooperation with the Bureau of Agricultural Economics, indicates that colored farm families in the South spent an average of $334 per family for food in 1945. A breakdown of the families into tenure groups shows that farm owners spent $385, sharecroppers, $317, and tenants, $311.

The higher expenditures for food by colored farm owners reflect their larger incomes over colored tenants and croppers, the report points out. However, the larger food expenditures by sharecroppers over tenants do not mean that the former group eats better than the latter, but rather that croppers have fewer opporunities for producing more of their own food supplies.. Also, it may indicate that sharecroppers families are slightly larger than tenant families.

A comparison of expenditures by white and colored farm families in the South shows that white owners spent $16 more for food in 1945 than did colored owners. The figures were $401 to $385, while for white and colored tenants, they were $394 to $311. Significantly, white tenants not only spent more for

(Continued On Page 4 Col. 1)

Corn Profits Hiked By Use Of Fertilizer

Farmers who question the profit in fertilizing corn and continue to produce it year after year without using commercial fertilizers are missing an opportunity to increase their yield by 24 bushels per acre.

Bruce Hatcher of Nashville, assistant U-T Extension Service agrionmist, said today that the average increase per acre on demonstration plots over the state was 24 bushels. This increase over unfertilized acreage was made at a cost of $10 to $12 per acre.

While 400 such demonstrations were held, complete reports have been received from 235. These showed an average yield of 72 bushels per acre on the fertilized plots, and 48 bushels on unfertilized check plots in the same fields. The average cost of fertilizer was $13 per acre.

Thus, at November corn prices, the return was $3.95 for each dollar invested in fertilizer. Highest yield reported was 148.7 bushels per acre, grown by Wayne L. Smith, Knox County farmer.

The demonstrations, averaging about four per county in the State, were supervised by county agents, who recommended use of adapted soil and hybrid seed corn, proper rate of planting, fertilization according to needs as shown by soil tests, shallow cultivation, and crop rotation and erosion control practices.

Cooperating with the Extension Service in the demonstrations were the Tennessee Fertilizer Council and the Tennessee Crop Improvement Association. The tests have proved so successful that they will be continued this year.

What Is $693,000,000?

Last year, the United States suffered a fire loss of nearly $693,000,000. A figure like that, even in these days of billion-dollar calculations, is too large for anyone but an advanced mathematician to visualize. So the National Board of Fire Underwriters has released a few comparisons that show clearly the incredible magnitude of fire waste in 1947.

It was fifteen per cent greater than the whole farm income of New England in 1946. It was 40 per cent greater than the total education budgets of all American cities of more than 25,000 population in 1945. It was greater than all the tax revenues received by New York State in 1947. And finally, it was about equal in dollar value to the total payroll of the transit industry in 1946, the wages of the whole light and power industry in the same year, and the net income of all American railroads in 1944.

Even that is only part of the story and the smallest part. The $693,000,000 was direct, calculable loss. The indirect loss, which cannot be precisely measured, is estimated to be two to three times as great. It is totaled in lost jobs, wages and taxes; in diminished production, and in all the other wastes that go with fire.

Last year's loss was about $131,000,000 above the previous high established in 1926. It was a monument to American folly. Will we build another such terrifying monument in 1948?

28 MILLION WOMEN HOLD INSURANCE

"Ann Arbor, Mich. (WNNS)—Approximately 25 million women and nearly half the children in this country hold life insurance policies, a study just completed by the Survey Researeh Center of the University of Miehigan here has found.

"Of the 25 million women, nearly 20 million are wives living with their husbands, aceording to the study, which was done for the Institute of Life Insuranee. Sixty-five per cent of all widows with dependents and sixty-three per eent of all single women own insurance policies, the survey reported."

For Better Garden Results Follow Hints Given Here

By Dr. Floyd Bralliar

Tennessean Garden Editor

We have decided to give a few hints which we hope will help our readers to grow better and more profitable gardens.

First, have your soil tested to determine whether it needs lime, sulfur, or any other treatment to correct its degree of acidity. The best way to do this is to call on your county agent, who will make suggestions as to the best method to correct any deficiencies. Most garden vegetables thrive best in soil that is slightly acid, or neutral. With an abundance of humus in the soil they will succeed in a wide range of acidity or alkalinity. This work should be done promptly, for in all probability some of the earliest gardens already have been planted.

Use Complete Fertilizer

Second, because it is now too late to fertilize heavily with fresh stable manure, give the soil a coat of a good complete commercial fertilizer spread evenly at the rate of about five pounds each 500 square feet. The more plant food elements this fertilizer contains the better. It is best to do this fertilizing not more than four or five days before working the soil for the plant bed.

The seed bed should be worked three or four inches deep and worked thoroughly so as to be free of clods. Usually a steel toothed rake is the best tool to use for this purpose, though many gardeners find that it usually pays to break up the soil three or four inches deep with a spade before using the rake. Best results will be had if the soil has been turned over from eight to 12 inches deep at least 10 days before making the seed bed.

Third, when carefully planned, your garden can be made to produce from spring on through autumn.

Succession Crops

Fourth, make your plantings so as to get a continuous supply throughout the season.

Fifth, plant both "early" and "late" varieties.

Sixth, make sowings of quick maturing sorts every few weeks for "succession" cropping.

Seventh, plant quick-growing crops, like lettuce and radishes between slow-growing kinds like cabbage. They will mature before the others need room.

The more thoroughly the seed bed is worked just before planting, the longer it will be before weeds come up. Of course your garden should always be kept free from weeds and the best time to do this is to get after them as fast as they come up.

Use Steel Rake

If the soil is in good condition the tool to use in keeping it free from weeds is a steel garden rake. For with this we can cover the ground rapidly, kill all weeds and leave the surface fine so that it will act as a dust mulch. If this is done once a week, the only place the weeds will make any trouble at all is in the row itself. A little hand weeding is usually necessary to keep the weeds out of the row until the vegetable plants are large enough to share the row. This work can be done with a good sharp hoe used with a scraping movement and some people prefer to do it this way but the hoe does not leave the soil in such good condition, though it is absolutely effective in killing all weeds.

We perfer doing much of our tilling with a rake because it keeps a dust mulch on the surface of the soil anl not only prevents rapid evaporation of soil-water, but it keeps the soil in a condition to absorb rapidly any rain that falls, and plenty of water in the soil at all times is the price of a first class vegetable garden.

Don't Plant Too Much

Eighth, most inexperieneed gardners plant too many seed, that is they drop the seed too quickly in the row, and as a result, they must do much tedious work later thinning the plants to stand the proper distance apart or allow them to grow into dwarf, inferior plants because they are too crowded. Besides when we thin plants that are growing thickly in the row we are sure to break part of the roots of the plants growing next to the ones we pull out, and it takes a week or so for the plants to reestablish themselves and get in good growing conditions.

Those who saved the planting and germination table published recently, or who have a copy of our book, "The Southern Gardener," should refer to it before planting their seeds, and mix a few quickly germinating seeds with all seeds that require 10 days or more to come up before planting the seed. We think radish seed is about the best thing to use for this purpose, for within five days they will be large enough so that we can easily see the rows—which is a great help in every cultivation. In fact, where slow germinated seeds have been planted, we can often rake the soil an ineh or so deep over the rows themselves, and so destroy all weeds without doing any damage to the seeds we have planted.

This article applies equally well to the flower garden and especially to the gardens which are planted with annuals or flowering bulbs.

Lunch Pail Care

Scalding and airing at night is the way to prevent that "stale" order in the lunch pail which may give an unpleasant taste to food carried in it, home economists of the U. S. Department of Agriculture remind housewives who pack lunches for the men or children in the family. Food is closed up in lunch pails or boxes for a long time each day. When these containers come home at night, they should be washed thoroughly, rinsed with hot water, and left open to air and dry.

Occasional sunning on Sunday also helps keep them fresh and free from odors.

"Don't Try It Again"

A letter recently appeared in the Omaha World-Herald which has received national acclaim. It later developed that it had been written by Chester E. Beltz, a fireman who works for the Union Pacific Railroad. Mr. Beltz had long been interested in the cause of safety, partly as a result of the safety training which he received from the railroad. Here, in part, is his letter, addressed to the unknown driver of a car which was almost struck by a train:

"I don't know who you are, but I know you were scared to death when you drove your car across directly in front of a speeding passenger train. It was so close that I, in the cab, could see the young girl (your sweetheart, I presume) throw her hands up in front of her face and cringe up against you in stark horror.

"If I were that young girl I'd pull away from you, fast. You didn't have good sense, son. You probably say you love her. I wonder. Those we love we try to protect. But not you.

"Wouldn't that have been a nice present to hand your mother—a broken and battered body. And how do you think that we in the cab of that engine would feel. We are human beings too----

" You and your girl were one second from Eternity, son.

"I hope you read this and know it means you, and that the girl will, too. Next time you go driving around, stop and look. We don't want to hit you, but we are helpless, as we cannot swerve away from our given rail.

"If I were you, I'd thank God for that split second He granted you.

"I said a prayer for all when I realized you were going across. Perhaps that's what saved us all.

"Now think it over, both of you. And I'll bet you are both still shaking in your shoes. And please, for God's sake, don't try it again."

Flour-Making Due To Change; Bleach Gives Dogs a Fit

New York —(AP)— American millers, bakers equipment-makers and food scientists are set to change flour-making.

The proposal is to replace agene, a chemical used for 25 years to age white flour. Most Americans eat bread of flour treated with agene.

But such flour, when fed in higher amounts than humans usually eat, causes running fits in dogs. The fits resemble epilepsy.

The flour, when fed in many times ordinary human amounts, also causes similar harm in rabbits cats, mink, ferrets and, to a slight degree, in monkeys. No harm has been found for rats, guinea pigs and chickens.

No bad effects of any kind have been found to date in humans. Dr. C. A. Elvehjem, University of Wisconsin nutrition scientist who is making the human tests, reported Feb. 9 that more than 20 persons have eaten test agenized materials. Some have had this diet for 10 weeks. Recently high levels of heavily treated food have been fed without signs of damage from agene.

Agene is applied to 0 to 90 per cent of the white flour made in the United States, England and Canada.

Discovery of the fits in dogs was first announced by Sir Edward Mallanby in London in December, 1946. His discovery was quickly verified and extended in the United States. Extensive federal, industrial and scientific research was started.

The millers national federation, the American institute of baking and the makers of agene, Wallace & Tiernan—three organizations representing the entire white flour industry—have informed the Associatted Press that they are going to change from agene to another aging chemical as soon as possible.

The U. S. food and drug administration chief, Dr. P. B. Dunbar, wrote the Associated Press.

"In the light of the long use of agene in the treatment of flour without any reports of injury to human beings—our legal advisors informed us that there was no legal basis upon which action could be taken at that time to prohibit the use of agene in flour.

"It would require the consumption of at least two one-pound loaves of bread daily for man to obtain an amount of agene-treated flour comparable to the minimum quanitity found to bring about adverse effects in the dog. Should evidence of possible human injury develop, we will immediately initiate such legal steps as may be necessary to bring about a discontinuance."

"We would frankly like to see the use of agene immediately abandoned. There are certain serious economic problems that cannot be ignored. Certain very important wheat-growing areas produce a wheat that requires either long storage or an artificial manufacturing treatment to render it suitable for baking bread.

"To prohibit use of agene completely until some suitable and entirely harmless substitute is available, would cause most serious flour shortages at this time."

Dr. Dunbar said there is already a market reduction in the amount of flour treated with agene.

Without waiting for definite evidence of human injury, the food and nutrition board of the national research council has informed the U. S. Food and Drug administration:

"In the board's judgment, there is a definite risk to human beings. Such injury to some element of the population may yet be revealed by future observations."

About what kind of harm may befall humans there are some guesses, published in scientific and medical journals.

Physiologist Dr. Anton J. Carlson of the University of Chicago suggested that agene might be responsible for nervous excitement that could lead unstable persons to seek imagined relief by excessive use of alchol.

Capt Maurice L. Silver and associates, of the U. S. army quartermasters corps medical studies on agene, advised doctors to look for possible connection with ulcers, split personalities (schizophrenia) and the patchwork hardening that appears from some unknown cause in the human brain and spinal cord.

A change-over will take time. It requires different machinery. The process is applied in the flour mills. Possibly $2,000,000 will cover the main expenses of the charge.

Wallace and Tierman were young men interested in the then new process of purifying water with chlorine. They tried chorine compounds for aging flour. They found one, nitrogen trichloride, which they named agene for age. It worked better than anything previously.

Agene completly eliminated storage. Flour went direct to the bakeries. The saving at that time was estimated at about 25 cents a barrel.

Baking machinery was modified because it was possible to bake bread faster with the agene-treated flour. Those machines changes are now one of the bottlenecks if agene is dropped. The rapid baking machines would not handle the old type of sticky dough.

The substitute chemical is chlorine dioxide. It has had months of testing by Wallace an Tierman, and by university and other laboratories, to see whether it is harmful for man or beast. No bad effects have been reported. Originally the makers of agene made extensive health tests on rats, at that time a widely used nutrition animal.

Experiments on the substitute have been made on dogs, monkeys, cats, rats, chickens and guinea pigs.

First news of Mallanby's dog fit discovery was cabled to Wallace and Tierman. They took it directly to the U. S. food and drug administration, which acted as advisor on a nationwide investigation that started immediately.

Worse Than the Blitz

What would you think if you were told that in a single year fire loss in the United States was as great as the estimated property damage done in Great Britain during two years of the terrible German blitz?

You might doubt the accuracy of the statement. But the truth is that our 1947 waste was actually 75 per cent greater than the loss England suffered in two years of blitz attack. And it was about twice as great as the damage done in the San Francisco fire which, after forty years, is still remembered as one of the most disastrous conflagrations in history.

Fire is now taking a record toll. There are various reasons, of which high replacement costs are among the more important. But, whether building costs are high or low, the main cause of fire is unaffected—it lies in human failure of some kind. Today inflation, combined with the building shortage, has made every house, store, factory and warehouse more valuable than before. It has, in addition, resulted in an overcrowding of buildings, thus increasing the value of their contents. Today every careless act is poten tially far more destructive than in the past.

Fire can be compared to war as a killer and destroyer. And, like war, we can prevent fire if we sincerely want to. Prevention of war lies in the difficult field of international policy prevention of fire can be accomplished here at home. Will we accept a challenge that is aimed directly at us all?

When Eddie, the noticably slow-moving and inefficient clerk in a small-town general store, wasn't in evidence one morning, a customer asked: "Where's Eddie? Ain't sick, is he?" "Nope, he ain't sick," replied the proprietor. "He's just not working here any more."

"Got anybody in mind to fill the vacancy" responded the curious villager. "Nope," said the propieter. "Eddie didn't leave no vacancy."

First In U. S. To Get Government Insured Farm Mortgage Loan

The first insured farm mortgage loan in the United States to a Negro family was made to Mr. and Mrs. R. C. Collins of Chancellor, Alabama, through the Farmers Home Administration of the Department of Agriculture recently.

Upper Left -- Collins, World War II veteran, and his wife, Jessie Lee, receive the deed to their new farm from J. L. Crowell, Geneva County, Alabama, Supervisor of the Farmers Home Administration.

Lower Left -- The Collins family on the front steps of their new home. He served four years in the Pacific during the war with the 903rd Air Base Security Battalion as sergeant in charge of communication. They have two children, a six year old son and a baby daughter.

Upper Right -- Sharecropper's cabin that was their home for more than two years after his discharge from the Army in 1945.

Right Center -- Newly painted, white, 7-room bungalow which the young couple moved into on New Year's Day. It has 3 bedrooms, a large living room, dinning room, kitchen, bath and ample closet space. The house is wired for electricy and has running water. The farm contains 120 acres with 80 under cultivation. The 40-year loan was made by the Citizens Bank of Geneva (Alabama) and is guaranteed by the Government.

Center Inset -- Collins checking his electric water pump which supplies an abundant water supply for the house and barn.

Lower Right -- Mrs. Collins with a few of her chickens. She has 25 hens now and plans to increase this number to 100 by spring.

Turn, Manure Gardens Now For Best Results, Says Bralliar

By Dr. Floyd Bralliar

The success of a garden depends to a great degrec on the proper preparation of the soil before any seeds are planted or any plants set in the ground, and if the right thing is not done at this time no amount of effort later on will quite make up for this failure.

We have urged repeatedly the importance of fertilizing the ground heavily with stable manure and we have said that fresh manure was equally desirable to old well-rotted manure, if plowed under deeply before or up until about the middle of January.

Humus In Soil Required

We have also urged the turning under of weeds, grass, and other simular material to make humus in the soil. But as valuable as such material is, we wish to say that it

If the garden was manured heavily last fall or winter, and if well-decayed manure without much straw or sawdust in it is available, spread a reasonably heavy coat of it on your garden at once. But whether you manure it or not, plow or spadè the ground deeply before the end of February. Let it lie rough until time to plant.

It is highly important that this be done for there is little if any danger of the soil baking as a result of turning the soil while it was too wet. While if we wait until the warm weather of spring arrives before turning the ground, it is almost sure to bake if it is wet when worked.

Early Turning Important

There are two important reasons for getting the entire garden turned at this time. First, none of the insects that are passing the winter in the ground, have left their winter homes yet, so turning the soil now means sure death to them, provided it is turned to a depth of eight or 10 inches.

The second reason for getting the garden turned now and leaving it in a rough state is that the soil will take up the spring rains allowing them to soak deeply into the ground. By this means we are almost sure not to be troubled by drouth.

In order to have the best success with vegetables, especially with tomatoes and root crops. it is highly important that the soil be worked deeply both throughly to aerate it and insure a good circulation of air as far down as the roots go. If we wait until the last of March or the first of April to turn the soil many of the insects will have already emerged and will make us trouble all summer long.

If you have not manured your garden plot, and have no fully well rotted manure to use at the present time, you will be compelled to depend on chemical fertilizers wherever they are needed. But do not put them on the ground before turning. To do so means to lose a considerable portion of them by leaching or by chemical reaction before there is any crop there to use them. Ordinarily chemical fertilizers should not be put in the ground until the crop is ready to be planted.

Nitrogen and DDT Boost Output of Blue Grass Seed

Tests made by the Central Kentucky Agricultural Experiment Station last ycar indicate that blue grass seed yields may be multiplied four or five times by applying nitrogen fertilizer to increase fertility and by dusting with DDT to kill insects.

Top-dressing with 60 pounds of fertilizer nitrogen to the acre and dusting with 30 pounds of a five per cent DDT dust brought an average yield of 602 pounds of cleaned seed or 69 bushels of rough cured seed an acre with a clean-out of 61.8 per cent.

This compared to an average yield of 154 pounds of cleaned seed or 282 bushels an acre, with a clean-out of 37.6 per cent. where there was no treatment.

Top-dressing with nitrogen alone increased the yield to 341 pounds of cleaned seed or 49 bushels of rough-cured seed to the acre. with a clean-out of 48.9 per cent.

Dusting with 30 pounds of five per cent DDT dust to the acre, without applying nitrogen. increased the yield of cleaned seed to 289 pounds or 36 bushels of rough-cured seed, with a clean-out of 56.8 per cent.

In dollar terms, on the rough-curred basis and 1947 seed prices. almost $53 an acre was realized over and obove the cost of materials where both nitrogen and DDT were used.

The tests were made in a 100-acre pasture on the farm of J. D. Gay, Jr., in Fayette County, Ky.

Even a Better Mousetrap Costs More—On Credit

By T. E. Applegate

New York (AP)—Whether you build a single house or a large apartment project, most mortgage experts say, it probably will cost you more to finance it this year.

Far from working hardship, this will prove to be a good thing for all concerned by assuring an even flow of construction money, in the opinion of George W. Warnecke, head of the New York mortgage banking firm bearing his name.

As far as the average person is concerned, Warnecke said in an interview, one of the most important benefits will be the effect of higher interest rates on the housing shortage.

Seek Highest Yield

"Investors naturally seek the highest yield the market affords," he explained. "With industries turning to private capital to finance expansion programs, many mortgage investors might me inclined to divert funds to this channel, if it should prove more lucrative.

"Such a development would hamper seriously the tremendous building program now under way. But if financial institutions can realize a reasonable return from mortgage investments, they are ready and willing to supply almost unlimited funds for this purpose."

A more general benefit of higher mortgage rates is their anti-inflationary influence, Warnecke said. Pointing out that life insurance companies and savings banks are heavy investors in mortgages, he added:

"When earnings on these mortgages are low, the cost of protection to the individual insurance policyholder is increased. Similarly, when the yield to the savings banks is depressed, the depositor suffers."

Rates Are Sign

Contributing to the trend toward higher interest rates generally are signs of gradual relaxation of the government's "cheap money" policy which it maintained during the war to service its huge debt at as low a rate as possible. Lowered support levels for government bond prices, and advances in rediscount rates, are recent steps toward such relaxation.

Increased interest rates produce benefits in two ways, Warnecke pointed out:

They tend to correct the unbalance between people who rely on annuities or fixed income. and those in current wage scale brackets.

They give assurance to the investing public that there will be adequate return on funds loaned.

An upward move in mortgage rates is a reversal of wartime trends, when with private construction halted, lenders engaged in fierce competition to invest in existing buildings. This rush for such investments helped slash interest charges.

Now a swing in the other direction may be expected, Warnecke said, as the pent-up demand for dwelling units and office space is gradually satisfied, the construction program expands and demands for mortgage money increase.

New Irish Potato To Be Introduced

A new early-bearing Irish potato of high quality and reportedly able to outyield any potato grown in the South was introduced to 350 Davidson county farm people here recently.

Owen E. Hodges, assistant county agent, called the special meeting for 10 a. m. in the county court room in the Courthouse. Future Farmers, 4-H clubbers, farmers and gardeners were invited to see the first bag of Sequoia potatoes, to be shown by J. J. Byrd, associate horticulturist, University of Tennessee at Knoxville, where experiments have been made.

The new variety will be introduced next into Knox, Hamilton and Shelby counties.

Two old maids were discussing men. Asked one: "Which would you desire most in a husband—brains, wealth or appearance?"

"Appearance," replied the other, "and the sooner, the better."

Hair On Your Chest Means Less on Head

New York—The man with hair on his chest may be more likely to grow bald.

H. Harris, of Cambridge, Eng., finds that baldness is more frequent in men with aboundant hair on chest, arms, legs, and abdomen than in men with little body hair growth. He surveyed the hairiness of 600 men, including a group who were slightly bald and a group who were really bald, the journal of Modern Medicine reports.

There's still nothing you can do about it. Inheritance determinens how much hair you'll have on your chest, and how long you'll keep the hair on your head, Harris said.

Lack of Live-at-Home

(Continued from page 1)

food than did colored tenants, but they also spent more than did colored owners.

This is understandable in view of the fact that the average sized farm of white tenants in the South is 116 acres as compared with only 60 for colored owners. The larger sized farms reflect higher incomes and, therefore, more money for food.

The report also compares food expenditures of farm families in the North Central region with those of farm families in the South for the years 1941 and 1945. It reveals that farm families in the North increased their expenditures for food from $259 to $489 during the period, while in the South, food expenditures increased from $169 to $381. Part of the increase is the result of 39% rise in food prices during the war, the rest indicates a higher level of consumption, says the report.

Although white and colored farm families in the South made a marked advance in food consumption during the war years, their level of food expenditures was still 28 per cent below that of the North in 1945. Even tenants in the North spent more for food than did white owners in the South. The figures for 1945 were $464 to $401, while for owners in the North, the figure was $498.

Department officials point out that one of the most significant aspects of the report is the pointing up of the importance of home-grown food supplies which enable some farmers to reduce their food expenditures without reducing the size of servings on their plates. Within the last several years. Extension Service and the Farmers Home Administration have helped many farmers to develop well rounded live-at-home programs.

The fact that 270,000 colored share cropper families in the South are spending more of their low-income for food than are colored tenants indicates the disadvantage of unstable tenure which lessens the opportunities for farm families to develop adequate gardens and accumulate poultry and milk cows.

Sec'y of Agriculture

(Continued from page 1)

ment in farm income has provided a basis for better rural housing through which twice as many families were able to finance accepable housing between 1939 and 1945, still about 1,500,000 were unable to do so.

"Low farm incomes in the past . . chronically low in some areas . . ." said Anderson, "are responsible for the situation." Other factors which he says are contributing to poor rural housing are: lack of housing education, shortage of designs and materials, lack of low-cost electric power for lighting and for operating a water system and home conveniences, lack of skilled labor in rural communities, in adequate credit, and the high cost of materials.

The Secretary says that in addition to the credit aid which is being provided by the Farm Credit Administration, the Farmers Home Administration, and the Rural Electrification Administration, farmers need special credit for the improvement of their housing.

"Large numbers of farm-operator and farm-laborer families live on farms which in the present condition. "says Anderson, "will not support adequate housing. Many of these farms could be enlarged or improved so as to increase their earning capacity. Public assistance to this development would be for the general welfare."

Turning to another need of rural people, Secretary Anderson says in his report that farm families face all the hazards that other families face old age with income reduced or gone: accidents, disabilities, and sickness that reduce income and bring high medical and other expenses. They also face early death of the main earners.

"Farming is one of the most hazardous of occupations," says the Secretary. "Farmers with at least a moderately good income can afford to pay for some insurance and to save something for emergencies and old age. However, the insurance and saving of many of them are too low to provide for even minimun needs."

Continuing, Anderson says, "Well over half the farm operators, and an even larger portion of hired farm workers have such low incomes that they make practically no provisions for insurance, emergencies, and old age.

"With the exception of public assistance, farm people do not participate in the benefits of social programs even though indirectly, and sometimes directly, they help pay for them," Anderson asserts.

When the colored preacher said to Brother Jones that he should give a small donation, for a fence around the cemetery, Jones replied: "I don't see no use in a fence around the cemetery. Dem what's in there can't get out, and dem what's out sho doan wanna get in."

Agricultural

(Continued from page 1)

000 were hired workers. However, by 1929, the overall number had decreased to 11,289,000, or by about a million. And by the end of 1947, the number had declined by another million and stood at 10,157,000 hired and family workers.

A breakdown shows 1,400,000 fewer family workers and 600,000 fewer hired workers in 1947 than in 1909. The decrease in number of farm workers is largely a result of increased urban industrialization and increased efficiency on the farm through mechanization and improved farming practices.

However, the decline in employment has been accompanied by an increase in wage, except during the depression years of the 1930's. In 1909, average wages throughout the country for farm work were $1.30 per day without board. By 1929, the wage level had climbed to $2.25 per day, and by 1947, to $5.10 per day. In the South, farm wages increased from $1.12 per day in 1909 to about $4 per day last year.

On January 1 of this year, farm employment totaled 8,129,000 or 143,000 fewer than on the same date a year ago.

Champion Oklahoma

(Continued from page 1)

more than doubled. In addition to growing cotton as a cash crop, Johnson was producing also tomato plants and tomatoes, milk, butter, eggs, and cattle.

"My 39-acre pasture," Johnson says, "would provide grazing for only four head of cattle in 1941; now I'm grazing 17 head on it. Besides I cut nearly eight tons of hay off it last year. You know, it's just plain dollar-sense to conserve your soil. Now that I have improved my farm, I've been offered as much as $4,000 for it. Without my land improvements, my farm would bring only about $2,600 today."

In recognition of his carrying out sound soil conservatinn practices, Johnson received the Oklahoma Bankers Association certificate of award last spring, and was awarded $100 and acclaimed the Oklahoma champion soil conservation farmer of the year at the recent Log Cabin, Georgia, Soil Conservation Jamboree.

Farmer Johnson not only conserves his land, but he and his family also can and store up enough meat, fruits, and vegetables for a year-round live-at-home program. Last year, Mrs. Johnson canned over 300 quarts of fruits and vegetables.

It isn't all work and no play on the Johnson farm either. They take trips and they believe in recreation is fishing. Soil Conservation Service has helped them to dig two ponds on their farm. The fish may not always bite, but they know they are in there because they stocked and fertilized their ponds. Fresh fish supplement their other home grown products in their balanced diet.

Farmer Johnson says that sound soil conservation practices have not only paid off in dollars, but also in better living. "I have the assurance, too, that my children will be able to make a living off this farm, because we are not letting the topsoil wash and blow away."

What does your anxiety do? It does not empty tomorrow of its sorrow; but ah! it empties today of its strength. It does not make you escape the evil, it makes you unfit to cope when it comes; it does not bless tomorrow, but it robs today. For every day has its own burden. God gives us power to bear all the sorrow of His making; but He does not give us the power to bear the sorrows of our own making which the anticipation of sorrow most assuredly is.—Ian Maclaren.

* * *

Satan is subtle, he will make a man proud of his very graces; he will make him proud that he is not proud. Pride grows with the decrease of other sins, and thrives by their decay. Other sins are nourished by poisonous roots, as adultery is nourished by idleness and gluttony and murder by malice and envy; but this white devil, spiritual pride, springs from good duties and good actions towards God and man. Spiritual pride is a very great enemy to the good and salvation of man. Pride is like a very great swelling, which unfits men for any service.—Thomas Brooks.

Million Farmers

(Continued from page 1)

various loan facilities available to disadvantaged farm families through his agency.

"In the 12-year history of Farmers Home and its predecessor agencies," said the information specialist, "more than a billion dollars has been loaned to nearly a million white and colored farm families to help them climb up to a more acceptable level of living. Over 55,000 of these, "he said, "have been started toward farm ownership."

Henegan declared, "These farmers have repaid a Nations faith with interest not only in dollars and cents but in terms of sound self-respecting and responsible citizenship."

An exhibit on the work of Farmers Home with colored families was on display along with informative pamphlets at the convention headquarters.

Tony's Fix-It Shop

By Harriet B. Pennell

Tony was very proud of his new tool chest. It was a birthday present fom his Uncle John. He had kept it on Daddy's tool bench in the garage, all winter. But now that it was spring, he wanted a place for his tools, all by himself.

"May I have the big piano box for my carpenter shop?" Tony asked his father.

"Why, yes, if you don't tear it to pieces," Daddy said.

"I'll only take off enough boards to make a doorway," promised Tony.

It didn't take Tony long to fix the box and make the inside tight and snug by nailing pieces of heavy building paper over the cracks.

"Is this where you are going to play"? his friend Terry asked.

"I'm going to work here," replied Tony. "This is my workshop."

"Oh!" exclaimed Terry. "It's like my daddy's shop. He has a Fix-It Shop."

"What is that?" asked Tony.

"Daddy fixes almost everything," boasted Terry, like lawn mowers and all kinds of machines.'"

"That's what I'll call my shop. Ill fix toys for children."

"Can you fix my wagon?' 'asked Terry.

"Bring it over and I'll try," promised Tony.

There wasn't much wrong with Terry's wagon. Tony soon had it in good shape.

"Nelly has a table that needs fixing." Terry said. And he ran to tell Nelly about the Fix-It Shop.

A little glue fastened the leg on Nelly's table. She told her friend Gladys, about the Fix-It Shop. Gladys brought a doll's chair to be mended.

Nearly every day some child brought a broken toy to the Fix-It Shop. And every day Tony found out better ways of making the toys almost as good as new.

When Tony's Uncle John came to see the Fix-It Shop, he asked, "What do you do with the money you get for your work?"

"Oh, I don't make money,' Tony said. "They do things for me, too. Nelly and Gladys brought me some lemonade when they had a lemonade stand; and Terry gives me part of his candy bars.'"

"I see," said Uncle John, and he went away smiling.

The next day, something quite different happened. Tony heard his new neighbors, Peter and Mary Ann, quarreling.

Peter said, "I asked you this morning to water my garden because I had to go after my new shoes. Its as dry as a bone."

"I did—I did," sobbed Mary Ann. "I turned the hose on your garden."

Tony had seen Mary Ann watering Peter's garden. The hot sun must have dried it out. He stuck his head over the fence.

"I saw Mary Ann do it," he told Peter. "I was at work over here."

Oh, you're the Fix-It boy, arn't you?" Peter said, forgetting his anger.

"Yes," Tony said, "I fix broken toys."

"You fix quarrels, too, dont you?" laughed Peter.

"I don't like them," Tony said, "and I think you don't either. It didnt take you long to get over this one."

"That I don't,' said Peter. "I like fixing things better. Here, give me a hand and I'll come over the fence and help you."

Tony helped Peter and Mary Ann over the fence and they had a good time together, fixing things.

Plant 2 Cucumber

(Continued from page 1)

three cucumber seeds in a place every foot in rows five feet apart, and thin to one plant in a place when the plants are large enough to thin. They claim to get a heavier yield by planting in this way.

It is highly important to watch carefully for the cucumbers to come up. Just as soon as they break through the ground, they should be dusted heavily with snuff, pyrethrin powder, rotenone powder, or any other good insecticide dust that does not contain much if any sulphur. Be sure to get this around and underneath the leaves for there is where the cucumber beetles and other insect pests work.

First Two Weeks Vital

The first two weeks after the cucumbers come up is the vital time in their life. If the grower is careful to keep insect dusts under and around the plants for the first two weeks, he will be practically assured of a crop.

Because the roots of the cucumbers grow near the surface, it is important that they be given shallow cultivation. But this does not mean that they should be allowed to become weedy.

In Middle Tennessee, the first planting of cucumbers should be made the last week in April or the first part of May. Planted at this time, we may expect to be eating cucumbers in 60 days.

--We have had our best results by growing the varieties Straight Eight, Sunnybrook, and the best of all Burpee's hybrid. The latter variety holds up longer and produces the heaviest yield of first class cucumbers of any variety we have ever known.

This Same Jesus

Today on the road I met him:
The very same Jesus who trod
The old, old lanes and the highways
On his beautiful errands for God.

I was troubled and heartsick and weary
With a load too heavy to bear:
I cried aloud in my weakness
And suddenly he was there.

His gentle hand on my shoulder
Was lifting the burden from me,
And he dried my tears, and I knew him,
It was Jesus of Galilee.

No different at all from the Master
On the Jericho road that day;
No different at all from the Saviour
Along the Samaria way.

And I am so glad that I met him!
I knelt and called out his name,
And I am so grateful I found him
Unchanged and forever the same.

—Grace Noll Crowell.

TASTY GARNISH

For those who like horse radish, here is a different and tasty garnish for ham, veal, or fish. Add 1 tablespoon prepared grated horse radish, ¼ cup sugar and 2 tablespoons lemon juice to a can of apple sauce. Mix well.

Every Garden Should Have Good Bed of Asparagus

By Dr. Floyd Bralliar

Every family should have a good asparagus bed, for asparagus is one of the best vegetables grown.

Once the bed is established it will produce a good crop regularly every year. The family asparagus bed at my childhood home produced a good crop every spring for 20 years. Father sold the old farm and we do not know what became of the asparagus after that.

Because asparagus should become a permanent planting, not only should we use care in planting it where it will not be disturbed, but we can well afford to go to the time and expense of properly planting it, for if not properly planted it can never be made to produce first class crops.

Must Have Drainage

For best results asparagus must have good drainage. This is one of the most vital things about growing this crop. It will not thrive where the roots penetrate into muddy soil for any considerable length of time.

The second requirement is deep, very rich soil. It not only must contain plenty of plant food, but also should be well supplied with humus. The asparagus does equally well in sandy soil and clay soil provided the soil is kept fertilized and supplied with humus.

It pays to throw out all of the soil to a depth of two feet where the row of asparagus is to be planteded. This trench should not only be two feet deep but between 18 inches and two feed wide. Fill the bottom of this trench to a depth of five or six inches with stable manure that is well mixed with straw. or if you cannot obtain this, mix straw or leaves with the manure

Next mix soil and manure in about the proportion of three parts soil to one part manure, and fill in at least seven or eight inches with this mixture. Next mix one part of manure to five or six parts soil, and to this add a liberal supply of cottonseed meal.

Fill the trench to within five inches of the top with this. Cover this an inch deep with a good surface soil and on this set the asparagus plants. Place them about 18 inches apart in the row. Some growers set the plants as close as 12 or 15 inches apart in the row, but this seldom pays.

Cover the plants an inch or two with good top soil without any fertilizer mixed with it. Water the trench well and let it settle for three or four days. Then finish filling it with a mixture of one part manure and three parts soil.

When you have finished the asparagus plants should be about four or five inches under the surface. Many writers recommend planting asparagus 10 inches deep but that will never do for the South, especially in our heavy clay soils. If it is planted 10 inches deep, many of the plants would never come up.

Cut When 2 Years Old

"Do not cut asparagus until the bed is two years old. Then cut it lightly over a period of about three weeks. Beginning the third year the bed should be perfectly safe to cut all shoots for two months each year.

Beginning with the second fall after the bed is planted, mulch well with stable manure or some similar material every fall. Aside from keeping down the big weeds, this is all the care the asparagus will require, after the first year. The rows of the asparagus should stand three and one half to four feet apart. However, for ordinary family use it is usually best to plant only one row for 25 plants, properly set and well cared for, should furnish all the average family should use.

Mary Washington is probably the best variety to plant for it is not only the most highly resistant to disease, but yields heavy crops of exceptionally good quality.

It is usually better to set one-year-old plants than older ones, and while most asparagus is set in the spring, November is really the best time to make a new planting.

Pestiferous Starlings Were Immigrants In 1890

By DR. G. R. MAYFIELD

How the Starling came from Europe to New York City and how they spread from there to all parts of the United States is a long and interesting story.

It was a lucky break in 1925 that gave the writer of this article a chance to learn firsthand from the son of Eugene Schieffelin how his father brought eighty pairs of these birds to Central Park in 1890. The next year he imported forty more pairs and these became the ancestors of the ten million decendants (more or less) which now infest forty of the forty-eight states of the Union and all of Southern Canada from Nova Scotia to Alberta. But on with the story.

In 1925 Vanderbilt was celebrating its fiftieth anniversary. Among the distinguished guests were a Mr. Schieffelin and his wife who was a lineal descendant of Commodore Vanderbilt, founder of the University. As we three talked together I mentioned the fact that a Mr. Eugene Schieffelin had brought the first starlings to America and that hundreds of thousands of this species were now finding Tennessee a winter resort rich in food and shelter.

. "That was my father," he replied, " and I remember the time when he did it. He wanted to save the trees in Central Park from total destruction by insect pests. He had been told that Starlings were great insect eaters and would put a stop to the ravages of these pests. He little dreamed that his modest experiment in conservation would result in one of the most remarkable events in the history of bird life on this globe." At that time neither he nor I had fully realized the curse to our native birds which has come in the past twenty-five years.

Bird lovers who have tried to feed their favorite birds during the past three weeks have found that these greedy immigrants always eat at the first table and leave very little for our native songsters. They are so numerous and so ravenous that it is discouraging to many people in their efforts.

Bird observers have seen in the past 20 years how these foreigners not only take food from American birds, but also take over nesting sights by sheer force of numbers and audacity. Five years ago this winter I shot three out of a gang of Starlings who had a Flicker down at the foot of his own nesting tree and were doing him to death with their long sharp beaks.

Bluebirds, Woodpeckers, Flycatchers and other birds nesting in cavities have been driven away or killed if they dared to resist. Not until these gangsters were supplied with holes was there any place or rest for our native species. And this is the greatest menace to our own feathered friends. Starlings are really more useful than harmful to farmers, foresters and gardeners as they consume many destructive insects. But their numbers and their nesting habits drive away all self-respecting birds.

Spread Slowly at First

For the first 2 years the Starlings did not fan out more than 100 miles from New York City. Then they seemed all of a sudden to regain the wanderlust of their forefathers in Europe and followed their American kinsmen, the grackles, the redwings and the cowbirds, as far west as the Mississippi, as far south as Florida, and as far north as Quebec. In the winter of 1920-21 several hundred of them roosted for two or three months on Centennial Hill. One of them was picked up dead by a policeman and identified by A. C. Webb as the first specimen in Middle Tennessee. In June, 1927, Vernon Sharp and I found the first recorded nesting pair in Congressman Houston's yard just east of Woodbury. The next year found two or three paris nesting in telegraph poles near the L. and N. underpass. Some pairs chose the Vanderbilt Campus as a residence in 1929. Westward, south ward and northward has been the course of their empire which now covers nearly half the North American continent. It is predicted that they will spread like the English Sparrow all the way to the Pacific and then reach a point of saturation and cease to multiply. Unlike the sparrow they have learned to migrate in vast hordes and Tennessee seems to be a favorite with them. In addition to the millions that winter here other millions seem to come through in late January and early February which accounts for the tremendous flocks that now swarm down upon our feeding shelves, our yards, our fields and forest areas. Within 10 days or two weeks most of them will continue north, leaving still all too many to plague our own Tennessee species at nesting time.

It is too bad that European Skylarks, Nightengales, Song Thrushes and Goldfinches could not survive in America as have English Sparrows and Starlings. Repeated attempts in this direction have all failed. In recent years Uncle Sam has established an Ellis Island for all foreign birds, animals, insects and plants. Never again we believe can history repeat itself as happened with these two pestiferous species from Europe.

Personal Grudge

Finally, I have a personal and professional grudge against Mr. Starling. This is the fact that these birds have learned to imitate the calls and to some extent the songs from 35 species of our common birds, Pewees, Cowbirds, Grackles, Bobwhites, Bluebirds, Cardinals, Titmice, Meadow Larks, Jays, Towhees, Kildeers and Robins are the favorites with them. Up to 1930 I could say with assurance when I heard a bird call or sing, "That is a so-and-so," now I have to trudge across half the campus to see the bird before I can record its presence. When said caller turns out to be a pesky Starling I am still inclined to call him a "so-and-so" but with an entirely different meaning.

"What can we do about it?" is the question heard many times each day. The answer is "nothing." Studies by bird experts, officials of the Wild Life Service, and thousands who have tried to control the Starlings in their nesting and roosting are in general agreement "Nothing effective," as yet.

In these times of meat and fish shortage it has been suggested that the Starling be trapped (if possible) or shot and eaten. Many persons find Starling on toast quite pleasing to the taste. Meanwhile, most of us will join in praying that the day of saturation will soon be at hand and free us from constant fears for the future of our native birds.

Extension Workers Assigned Important Role in Research

New educational and local demonstration work in marketing is the central theme of three projects under the Research and Marketing Act in which the State Extension Services will play an important role.

Under the plan. Extension workers will take new marketing research results directly to farmers. buyers, and consumers. These workers also will set up pilot demonstrations in marketing areas to help solve special marketing problems.

The projects approved fall into three types: (1) Improving marketing methods, facilities, and equipment, (2) developing new and expanded outlets, and (3) developing new market information and basic data. About 30 States are cooperating

Tips to the Dairyman

1) Dairymen should adjust their breeding program as quickly as possible to have a large percentage of their cows freshening in the fall.

2) Plans should be made now to produce enough feed to adequately take care of all dairy cattle next fall and winter.

3) Plans should be made to have sufficient green grazing next fall and winter.

4) Cows that are to calve next fall should be given a rest period of 6 to 8 weeks prior to calving.

Cabbage, an Early Favorite, Requires Rich, Moist Soil

By Dr. Floyd Bralliar

Cabbage is one of the oldest cultivated vegetables.

Two thousand years ago it was popular in Rome, and it did not differ greatly from the cabbage we now grow. Cabbage is one of our most popular vegetables for use all the year round, but we do not use it so freely, as it is used in Northern Europe, where most of our modern varieties originated.

Cabbage is grown easily and may be eaten raw, made into kraut or cooked in several ways. If properly chewed it is digested more easily when eaten raw than most other green vegetables. Kraut is also a wholesome food.

Every garden should contain cabbage and several plantings should be made at intervals of four or five weeks.

The common practice is to sow the seed in a window box, a hot bed or a cold frame. The seed should sprout in three to five days after planting and the plants should be ready to set out 30 days after sowing the seed. It requires 65 to 75 days for the plants to produce heads if early varieties are used and hundred or more days for late varieties.

For best results cabbage requires rich, moist soil and cool weather, though the late, slow growing varieties withstand hot weather.

Because cabbage is resistant to cold, there is, a common practice of buying so-called frost proof plants put in open ground in the fall and left there until the plants are pulled in early spring and shipped to us.

Because little attention is paid by some shippers to the quality of the seed they sow, the grading of plants, and exposure shock from lying for days before they are purchased. it seldom pays to depend on these plants. Buy good seed and grow your own plants.

Cabbage does best when set in deep, rich loamy soil and should be given plenty of water during prolonged dry spells. Space early cabbage plants 18 inches apart and rows 2 1-2 feet; the large midseason and late varieties, 2 feet apart in rows spaced 2 feet to 3 feet.

Cabbage should never be planted in the same plot where cauliflower broccoli, or any other member of the cabbage family had been planted the previous year. Healthy, solid heads of late cabbage may be stored for winter use.

Cauliflower should be grown much like cabbage. It will not withstand as much cold or heat as cabbage. Early cauliflower should be the only varieties used in our territory. The plants should be set in the open ground late in March or early in April.

Early Spring Is Best Time to Plant Your Evergreens

By Dr. Floyd Bralliar
Garden Editor
The Nashville Tennessean

The next six weeks is a good time to set out both narrow and broadleafed evergreens.

Those who wished to set evergreens last fall but did not do so, need not feel too badly about it. for spring gives an excellent chance to do this. In fact, early spring is the best time to plant most broadleafed evergreens. It is best to get the soil ready then wait until it is warm enough to permit immediate root growth. Many failures with newly planted evergreens of any kind are due to setting them out when the ground was too cold, another great cause of failure is that most people will not cut these evergreens back well by shearing them all over, neither will they go to the trouble to pick leaves of the broad-leafed varieties the two most important things to do when setting evergreens.

Require Loamy Soil

Narrow-leafted or cone bearing evergreens do best in a loamy soil that does not contain too much stiff clay. If the soil is a bit sandy yet contains a fair amount of clay, It is most suitable for them. Most of these evergreens do best in soil that is slightly acid, and the soil should be well prepared by making liberal use of humus material such as peat moss, well rotted leaves, and thoroughly well decayed stable manure. Most broad-leafed evergreens must have an acid soil that not only contains plenty of humus but is also well drained.

This is important for boxwoods. For these reasons it is always best to prepare the soil, blending it properly, two or three weeks before setting the plants.

Set Out Immediately

Another important thing is to set out all evergreens as soons as you get them. If possible go to the nursery and get your plants, asking the nurseryman to dig them with a considerably larger ball than is usually dug, and burlap them well. It always pays to have plants dug with an exceptionally large ball because this is important to the plant's growth. Never let these plants stand around for any considerable time before planting. It is best to set the plants the day you get them or at the latest the following day.

Before setting out any plant that is dug with a ball of earth on the roots, feel the dirt to see that it is not too hard, but be sure not to break the ball in pieces. If it is hard, it is best to remove the burlap when setting out. If the ball is not too hard, do not remove the burlap but set the plant with the burlap remaining on the ball. As is not only will help hold moisture around the ball, but it will rapidly decay making humus where it is most needed.

Make Deep Hole

In digging the hole, make it six or eight inches larger in diameter than the ball, and deep enough so that two inches of good soil can be placed in the bottom of the hole before, setting in the plant, and yet when the planting is finished, the bulb will be about one inch deeper than it was in the nursery. If your soil is not naturally acid, it usually pays to mix a good handful of sulphur in the soil that is used in setting out plants.

In preparing the soil for evergreens, it is well to mix a rounding tablespoonful or two of good complete commercial fertilizer as well as the sulphur we have referred to, with the soil that is to be used, in filling the hole as much as two feet in diameter. Should the burlap that holds the ball in place have been put on such a way that it extends up and around the base of the plant, cut it loose on both sides and roll it down far enough that when the planting is complete the top of the burlap will be an inch under the ground. If this is not done, the burlap may act as a medium for drying out the soil around the roots.

Roots Near Surface

Most evergreens, especially broadleafed ones, when fully developed have most of the roots near the surface, and many of the narrow-leafed evergreens grow the same way. For this reason, in fertilizing them we should never dig or hoe the fertilizer into the soil, lest we do more damage than good. Another important thing to remember is that most evergreens grow where their roots are shady, and seldom thrive where their roots are not protected from the sun. For this reason, it is almost always important to keep a mulch or ground cover of some sort under or around each plant. If a little care is used in selecting the material for this purpose, this mulch will not detract from the beauty of your planting.

An authority on children recently declared that if every child in the nation had a dog to love, and be loved by, there would hardly be a juvenile delinquency problem.

The world usually pushes a man the way he makes up his mind to go. If going up, they push him up: if going down, they push him down—gravitation, however, making the speed great in the decline. —GEORGE F. TRAIN.

Radish Crops Can Be Grown Practically All Year Long

By Dr. Floyd Bralliar

Radishes are not as popular in the United States as they are in China, Japan, and parts of Europe. But few of us would be satisfied if we did not grow a good supply of radishes in our early spring garden.

There are really three groups of radishes. The small very early varities that do well only while the weather is still cool, the large very crisp hot weather varieties, such as White Strassburg, White Vienna, and the winter varieties such as Chinese Ross. White Chinese, and long black Spanish. Those who really like radishes should grow all three types as by doing so they will have radishes practally all year long.

Rich, Deep Soil

To do their best radishes need a rich, deep soil that has been worked at least six inches deep before planting. Sow the seed of the earliest and midseason radishes as early as possible in the spring in rows 12 to 18 inches apart, covering them about one-half inch.

Because radish seed are almost sure to grow, drop the seed thinly in the row, trying to get only one seed to the linal inch of row, for the extra earliest, one seed every two inches for the later varieties. When it is time to plant the big winter varieties, they should not stand closer than two and one-half to three inches apart in the row.

Make Second Planting

Make a second planting of the early varieties about a week after the first plantiny is up. The early varieties lose their crispness and get hot and peppery if the soil is not rich enough or if the weather gets hot before the radish is large enough to eat. Pull them and use them before they get too big for they are at their best when they are not over an inch or an inch and one-half in diameter. Most of the early varieties are ready for use in from 20 to 30 days after the seed is sown.

Seed of winter radishes should be sown in the summer for fall and winter use. In Middle Tennessee, they are best sown about the middle or last of August, the latter part of the month being best. Harvest and store radish seed just as you would turnip seed.

The summer varities should not be planted before the first of April, and may be planted as late as the first day of May. Under the best of conditions they make long crisp radishes about two inches in diameter and may be as much as a foot long. If properly cultivated, and not allowed to get too dry they will be just as crisp in the middle of the summer as are the early spring varieties in their season, and they seldom have as much hot pepper flavor in them.

Radish tops are excellent to mix with your boiled greens or even to cook alone, and the radishes themselves cook like turnips and are really good.

HISTORY OF PEPPER PLANTS OF INTEREST TO GARDNERS

By Dr. Floyd Bralliar

It is often well to know something of the history of a plant in order to understand how to care for it better.

The pepper is a native American plant, discovered by the original explorers from Mexico south into the torrid zone.

It was used for flavoring purposes very much as it it used now. The Spanish people carried it to Europe where it was grown first as a curiosity. But when its value was known, people settled down to the job of improving it.

The wild plant is a tender parennial growing from six to eight feet high, even reaching 10 feet in rich soil. The peppers were small, and varied rather widely in flavor. In fact, the whole plant showed symptoms of variation on cultivation, which made it possible to develop the various types we have today.

Early Fruiting Kinds

The first real problem was to select early fruiting varieties so the pepper could be grown as an annual. The annual types are the only kinds we cultivate today.

All peppers are decidedly tender to frost in the spring, though they will stand light frosts in the fall.

As grown today there are two distinct families of pepper the hot or pungent varietiies, and the sweet varieties, so called, not because they are sweet, but because they are not hot.

The hot group varies greatly in size of fruit from no larger than the cherry to a fruit eight inches long and 2 and half inches in diamater. Some of these small varieties are grown as pot plants for Christmas because of the large number of brilliantly colored peppers they bear. If kept pinched back into shape and grown in fair sized pots, these plants may be kept bearing continuously for two or three years.

Divided Into Two Groups

The sweet pepper divide into two groups the large bell peppers, and the heartshaped pimentos. California Wonder is one of the very finest of the larger bell peppers and Sunnybrook is another. Sunnybrook is a short fleshy pepper and California Wonder is a giant fruit especially suitable for stuffing. Early pimiento is the best of the pimento type.

Pepper seeds germinate slowly so that it takes about 60 and 65 days between the sowing and the producing of good strong plants ready to set in the open field. This means the seed should be sown about now in a hot bed, a greenhouse, or a shollow box in a sunny window. Don't expect the seeds to come up within 10 or 12 days. Do not transplant to the open ground before May 1, for the ground must be warm for peppers. Set the plants from 12 to 18 inches apart in the row, and the rows from two to three feet apart.

Peppers bear best in rather loose, moist, soil that is not too rich. If given soil that is rich enough for cabbage or radishes, they are apt to make giant tops and little if any fruit. Of course this does not mean that they may be grown in just any old, poor soil.

Many do not know that they should pick the peppers as fast as they are ready for use, for by doing this, they will about double the yield of fruit the plants will bear. If green peppers are picked, or rather cut from the plant, just before the first frost, and laid away in a cool dark place that is not too dry, they will keep until Christmas.

French Endive—or Chickory Makes Ideal Garden Crop

By Dr. Floyd Bralliar

There are number of other vegetables of high quality, but unfortunately are seldom grown in Middle Tennessee.

In this last lesson of this garden series, we shall consider what is sold on the market as French endive. But as a matter of fact, it really is one of the varieties of chickory, witloof. Witloof chickory like all other root crops should be planted in good rich soil that has been worked very deeply. Plant in rows like carrots or beets, but do not plant the rows closer than two feet apart. If the garden is large enough to allow it, but the rows two and one half feet apart.

Thin in Rows

When the seeds come up thin them to stand five or six inches apart in the row. Cultivate well to keep them growing steadily, for for the larger roots they develop, the larger crops they will produce later on. About the last of August cut off all foliage about one inch above the soil level The youngest and most tender of these leaves makes excellent boiled greens, but it is not for them that we raise the crop.

We quote further directions from a well known seed company. Now cover the plants we have cut off with about eight to 14 inches of soil and straw.

If convenient, water at this time. Cover with boards or some similar material to hold the covering in place. In three or four weeks when a pure white blanched stalk should be ready, cut off about one inch above the top of the root and repeat as above for a second crop, or if wanted during the winter in cold sections, dig the roots, store for a few days in a shed or pit so they may become thoroughly chilled. Then place upright in boxes and cover with 10 inches of sand, light soil, or peat moss.

Water and keep In a warm place indoors. In about a month, the sprouts should break through the surface and be ready for use again as a salad." In middle Tennessee we can usually count on getting 2 crops in the open ground and indoors, a basement, a cellar, or a vegetable case are suitable locations for growing this indoor crop.

Under the name of French endive this snow-white chickory crop commands about the highest price on the market.

A traveler stopped in a small town in the Oarks and put up at the local hotel. While talking with some of the natives, he started to tell them the story of Andrew Carnegie.

'When Carnegie came to this country he rtd only 25 cents in his pocket, and when he died, he left more than $25,000,000." "Well," mused an old native, " he must have had a very savin' woman."

"Security is One Crop I don't Rotate!"

I'm planting steady in U. S. Security Bonds

"That's the big crop I keep after all year round, every year. In ten years I know it will pay off in education for my children, improvements in Betty's kitchen, more land for me and a nest egg for my later years. And best of all, for every $3 I invest in these Savings Bonds I'll get $4 back.

"I know Joe will be ready for college quicker than you can say 'alfalfo.' I'm earmarking some of my U. S. Security Bonds to send him to school in style.

"Betty and I have lots of plans for modernizing our home and the farm. It won't be hard, thanks to the money we're putting regularly in Savings Bonds.

"I'm looking forward to plenty of leisure hours as years go on. I keep one batch of my bonds in an envelope labeled: 'Things I've always wanted to do.'

"Bigger than anything else my Savings Bonds can buy me is the backing they give to America's security. It's a case of helping my country . . . and myself."

AMERICA'S SECURITY IS YOUR SECURITY

Gardenia Growing Presents Many Problems In Tennessee

By Dr. Floyd Bralliar
Garden Editor
The Nashville Tennessean

Over two years ago we wrote a general article on gardenias and tried to emphasize the fact that it did not pay to try to grow them in the open ground any where in Tennessee except in Memphis and the territory lying adjacent to it.

We also stated that it did not pay to try to grow the gardenia as a house plant. We haven't changed our opinion on this during the past few years, few plants have gained as much in public favor as the gardenia. Not only in the deep South where it can be easily grown, but as far North as Southern Ky. We received a deluge of letters asking for information on how to grow this plant, and especially how to get it through the winter uninjured.

Native of Asia

First we will answer, or at least try to answer, a popular question from readers, "What is the difference between gardenia and Cape jasmine?" The gardenia is a native of southern Asia. From the southern parts of China, southward throughout the East Indias when the British took over the government of India they carried many flowers including the gardenia, not only to England but some of them and especially the gardenia were carried to the cape region of south Africa. We understand they are found growing in abundance around Capetown.

There were several double white flowering jasmines being grown in both Europe and America both as hot house plants and as house plants.

Name Becomse Popular

When the first gardenias were introduced into this country they were soome way misnamed Cape jasmin. And because they did not gain popularity at once, the name became widely spread. So now gardenia and Cape jasmine are two names for the same plant.

With the distinction that often the original introduction is still locally known as Cape pasmine to distinguish it from the new large and finer varieties that have been recently introduced. Gardenias are somewhat particular in their requirements and it has never been possible to change their requirements very much.

Require Proper Soil

Gardenias require proper soil, and considerable care, but if a few simple rules are followed, they are not a difficult plant to grow. Gardenias are especially susceptible to the attact of nemotod, (root-knot), if they are growing on their own roots.

They can be rooted readily from cutting, but unfortunately nearly all of the plants that are offered for sale are growing on their own roots. Nemotod infestion is spreading rapidly throughout the South which accounts for much of the difficulty growers are having with their gardenias. Fortunately there is a species of gardenia, gardenia thunderberia, that is resistant to nemotod. And it makes an excellent understalk on which to graft the better flowering varieties.

One authority says. "Grafted gardenias can be planted in the ground, preferably in a swampy habitatat with an acid soil. However gardenia thunberger root stock is less particular as to soil type than own-rooted plants and consequently grafted plants can be grown in a wider rauge of soil.

Like Shady Location

Gardenias prefer a location where they are shaded from the hot noonday sun without disturbing the circulation of air. It also will thank you if you will keep a good mulch of well-decayed leaves around them. This helps keep the roots cool and conserves moisture for they do not like any great change in the amount of water they receive. If the soil gets too wet, and remains that way for a few days, they are almost sure to drop their buds. On the other hand, if they get too dry for a few days they are almost sure to drop their buds, and any considerable change in temperature, whether it be from hot to cold or from cold to hot has the same effect.

It usually pays to give gardenias a little good complete commerical fertilizer about the time the growth starts in the spring, but this must not be over done. If you feel your plants require more than this, mix a cup full of cottonseed meal, with the decayed leaf mulch that has been around the plant for some time, and work this mixture into the top soil, but do not go more than two or three inches deep, then put a new mulch on top.

Infected With Canker

We will quote again from a gardenia authority, "Should the plants growing on thunbergia stock start to loose leaves and die, you will undoubtedly find that they are infected with gardenia canker. In this case they should be discarded and burned, being careful to use new or sterilized pots for future plants.

Very few insects bother gardenias and fortunately those who do are easily controlled. Aphids sometimes attack young shoots. They and all other insects and diseases can be controlled by using some of the new insecticide and fungicide combination dusts. There are a number of thóse on the market under various trade names but they are all about equally efficient, and contain about the same material. Some of the new and improved varieties of gardenias now being offered are Belmont, Hadley, improved Veitchii, Mystery, and Pride of Daisy Hill. The requirements are all about the same, the chief difference being in size of flower, freedom of bloom, and type of growth.

Plenty of Coal

Certain government officials still want the power to completely control the price and distribution of basic commodities. Soft coal is one of the commodities that has been specifically mentioned. And just how that could be justified is extremely difficult to understand.

Coal production is at an all time high. Last year we produced 620,000,000 tons, and authorities within the industry say that more than 650.000,000 tons can be produced if there is a need for it. The government's own statisticians expect a demand of 625,000,000 tones, this year--a large figure, but well under the industry's present capacity.

As to the matter of price, coal has long sold at a low figure at the mines. Increases which have taken place have been the inevitable result of higher wages and more costly materials and supplies. The coal miner has a weekly income of from $75 to $100. The amazing part is that the industry has been able to keep prices as low as they are in the face of zooming costs all along the production line.

Controls always decrease production, instead of increasing production. That would be true of coal as well as anything else. Free enterprise gets the goods out and to the market.

Government Officials Ask Help of Home Gardeners

By Dr. Floyd B. Bralliar
Garden Editor
The Nashville Tennessean

We earnestly urge all of our readers who can possibly do so to join the ranks of the Freedom Gardeners this year.

During the war millions of our citizens, many of whom had never grown a garden before, grew most of their own vegetables. This made possible for the government to feed our armies all over the world better than any other armies have ever been fed. Since the close of the war, condition are such that the government tells us that it is much more important for all of us to raise our own vegetables than it has ever been before.

We recently attended a conference called by the United States government officials at Washington, to lay plans for putting on the greatest garden campaign ever put on in America. Four of the cabinet members attended and took part in this conference, which is some indication of the importance of this campaign in the minds of the government officials.

Home Gardens Urged

The secretary of state informed us that in his opinion the most important thing to do to help in the world food shortage is to grow our own vegetables as far as possible, and that wherever it is possible to do so, we should not only grow what we are to use fresh, but to can all we need for our winter supply. The government estimated that we must have at least 20 million family gardens this year if we are to meet the crisis that is developing.

One of the cabinet members who is in a position to know informed us that there are only five countries in the world today who are as well fed as they were before the war and that many of the countries of the world are not fed as well as at any time during the war. The plan is for us to grow our own vegetables in abundance so as to allow those who grow food commercially to furnish food to be shipped abroad. By growing our own vegetables we also save use of transportation facilities that are seriously needed for transporting other commodities.

County Agents Helping

Of course we cannot have enough space to give a complete report of the situation but we do earnestly urge our readers to rally to the situation.

County agents and home demonstration agents all over the United States are being asked to make it one of their first work to promote gardening everywhere. The government is especially asking that city dwellers raise more gardens than they have ever grown in the history of the county.

The governors of all of the states have been urged to co-operate in this campaign and most of them are already setting up machinery to help with this work. All of the newspapers of America have been asked to do their part in forwarding this campaign and most of them are already doing so.

Great Health Campaign

But we not only do our duty to feed the world, but we are putting on what will turn out to be the greatest health campaign ever put on in America. Most families would be greatly benefited by eating 2 or 3 times the amount of vegetables that they have been accustomed to eating, and it must be recognized that many of us will learn the true flavor of vegetables at this time by gathering them from their own gardens and cooking and eating them within an hour or two.

Not only is the flavor of such vegetables much better than that of the ones we buy on the market, but the vitamin content is much higher. Most vegetables lose a considerable share of their vitamins within a few hours after they are picked.

We have copied a table of information that we believe will be very valuable to our gardeners, and especially to those who are gardening for the first time. This table is a compilation but we especially give credit to the manufacturing of Vigero.

To Get Best Tomato Yield Grow Plants In Full Sun

By Dr. Floyd Bralliar

Tomatoes are one of the most important of garden vegetables. If properly grown, they yield very heavily, and they perhaps are as widely used as any other vegetable.

Middle Tennessee gardeners, if they care to do so, grow all of the tomatoes they wish to use fresh for seven months in the year as well as all they want to put up in the form of tomatoes or tomato juice. There is no deep and dark secret about growing tomatoes, but there are certain musts if we expect to succeed with them.

The first of these musts is a good location in full sun. Tomatoes can be grown in partial shade, but grown in this way they never produce a heavy crop and their quality is seldom first class.

Tomatoes feeding roots quickly form all the way from the basis seeding roots up to the top of the ground. It pays to work the soil from 12 to 18 inches deep where every plant is to be set.

If the soil is fertile to this depth, the base of the roots will penetrate to the bottom, and if the plant is set deep enough to put six or eight inches of the stalk above the basal root under the ground, the roots that form on the underground stem, will more than double the food-gathering root surface of the plant.

Plants set in this way can be expected to produce a much heavier crop than if set in the ordinary manner and will withstand drouth much better. After the setting is done, it requires a little more work to grow tomatoes in this way than to grow them in the ordinary way, and both the yield and the quality are greatly increased.

Bear Through Season

If these plants are kept free from disease they will bear straight through the season until frost kills them. But do not conclude that tall spindling undernourished plants are especially valuable for setting in this way, for they must recover from the results of their wrong culture before they are set out.

It does not pay to set tomatoes too early. If a little early fruit is especially desired, set a half-dozen good early plants about the 20th of April especially to get early fruits for the table, but do not put out the main crop of tomatoes untill at least 10 days after this. For early tomatoes we perfer the variety Victor. We regard it as the best extra early tomato we have ever grown.

Vines Are Short

The vines are short so that the plant may be set as close as two feet apart in the row, whereas most tomatoes should be set three to three and a half feet apart. For main crop use we recommend Cirtified Margo, Pan-American, and Certified Rutgers. However if the grower is willing to pay the price, charged for any of the new hybrid tomatoes you will find that they are not only much more vigorous than the standard varieties, but that they produce a heavier yield all through the season. We say this without hesitation after having tested most of the standard varieties for three years.

Tomatoes will usually yield more to the plant and be decidedly more free from diesase if grown on stakes than if allowed to lie on the ground. To do this a good strong stake about six foot long should be set at least a foot deep beside each tomato plant. In this way the stake will be firmly held in the ground by the time the tomato plants are large enough to reqiure a strong support. At a later date we will give details on how to prune tomato plants and fasten them to the stake in order to get earlier ripe tomatoes and better results throught the season.

Don't Fertilize Strawberries In Year They Bear

It is a mistake to fertilize strawberries in spring, hoping thereby to get a greater yield the same year, according to specialists of the U-T Agricultural Extension Service.

New strawberry planting should be fertilized at setting time at the rate of 500 pounds of a complete fertilizer per acre. This should be repeated in September. Old plantings should be fertilized at a similar rate at renovation time, June 1, and again in September.

Spring fertilizing of a crop to be harvested the same year frequently results in losses, it is pointed out. Nitrogen cause rapid growth of stems and leaves which shade the berries. This keeps them wet longer after rains, and causes loss of color and greater decay.

Deep, Rich Soil Is Best For Growing All Onions

By Dr. Floyd Bralliar

In spite of the fact that the onion is objectionable to some, it is one of the three most popular vegetables grown in America gardens.

It is strictly a cool weather crop and we should prepare the ground where they are to grow just as soon as possible.

To do their best onions should have deep, rich soil, and a well drained location. They should be planted just as early as the soil can be worked properly, and should be well cultivated and kept free from weeds at all times.

There are three ways to grow onions—by putting out sets by setting young green plants and by planting seed where the onions are to grow. For early green onions it is best to plant sets. For large dry onions for summer and early fall use plants are perferred, but for dry onions to keep all winter sowing seed is to be preferred.

Small Dry Onion

An onion set is a small dry onion that is a year old from seed. In order to get sets, seed is planted in rows in very rich soil at the rate of 25 pounds or more to the acre. Grown in this manner they are so thick that few of them make onions as large as an inch and a half in diameter. Harvested and well dried and cleaned, they are sorted and sold as sets. Should the sets be a little over size many of them are screened out and sold as pickling onions.

It is the nature of the onion to grow one year from seed and develop a large bulb. This bubl is decidedly hardy to cold and lives over the winter if left to itself. It throws up a bloom stalk and makes seed early the second year.

So firmly is this habit fixed that any onion an inch or more in diameter may go to seed rather than develop a large bulb.

Green Bunching Onions

If you wish to grow green bunching onions as early as possible, plant the largest sets you can get, but if you wish to grow dry onions, plant the smallest sets. Onion sets are grown almost exclusively from seed of the long keeping onions and for this reason the Onions grown from the plants that are offered for sale all over the land These plants have been grown from seed of the Spanish onion type, a large, early maturing onion that does not keep well.

It is natural for an onion bulb to grow on top of the surface of the ground or nearly so, so neither sets nor plants should be set very deeply. Set the plants the same depth they were growing before they were pulled for sale. It is easy to measure how deep this was, for the part was under the ground will be white. It pays to stand sets in an upright position, just deep enough—that the bulb is covered with soil. When growth starts the roots will gradually lift the onion to the surface as it grows.

Planted in Drills

In growing onions from seed, the seed should be planted in drills at the rate of four pounds per acre, making the rows or drills from 18 to 24 inches apart. The seed should be planted as early as the ground can be worked, but should not be covered more than an inch deep.

An authority says "The soil best suited to grow onions is one that is reasonably fertile, well drained, and well prepared. If fully matured onions are wanted, thin the seedlings when three to four inches tall, to stand sufficently far apart to develop without touching one another. When the bulbs have reached maturity, bend down the tops to hasten ripening before the onions are harvested. Store in a dry, free-from-frost, place over winter."

Onion seeds are slow to germinate, so it pays to mix a few radish seeds with them before sowing. Radishes come up quickly and show where the rows are.

WOMAN'S PAGE

Ham and Red Gravy Will Make Your Mouth Water

Our plain but palatable dinner includes fried ham with red gravy and hot biscuits, cranberry jelly, buttered carrots, baked sweet potatoes, deep dish cherry pie and coffee or buttermilk.

In the days when everybody killed enough hogs to provide meat for the winter, all you had to do to put ham on the menu was whip out to the smoke house, cut dwn a ham, wash it and slice it. The next step was fried ham and red gravy.

The chances are, however, that the city dwellers among our readers find it necessary to stretch their budgets in order to afford a country ham. It is a treat worth the sacrifice, for ham is popular not only as a holiday treat but the year round, and it is one of the meats which combines well with almost any other type of food.

Sugar-cured ham, when properly prepared, is a good stand-by and of course is not as expensive as country smoked ham. There are many other types available, too, from the picnic variety to the ready-to-serve number that is becoming popular. Directions usually accompany tenderized ham, and in every case the wrapper should specify whether the ham is a cook-before-eating type or a ready to-eat one. Be sure to have this information when you are purchasing a whole ham, as the two types require different baking or heating times.

Baked Ham

Remove wrappings from ham, but do not remove rind. Place fat side up on a rack in a shallow uncovered baking pan. Add no water. Bake in a moderately low oven, 325 degrees F, according to this schedule:

Whole ham, 14-16 pounds:

Uncooked—18 minutes per pound.

Ready-to-eat —10 minutes per pound.

Half-ham:

Uncooked—22 minutes a pound .

Ready-to-eat—10 minutes per pound

(Times given are for ham at room temperature when started. Since heat penetrates a thick piece of meat like ham very slowly, five minutes per pound extra time should be allowed when meat has been taken from refrigerator a short time before baking.)

Half an hour before ham is done, remove the rind and score fat into diamond shapes and stick a elove in to the eenter of each diamond. Cover with one of the following glazes and finish baking at the same temperature, 325 degrees F., until well glazed, basting frequently.

1. Apricot jam or orange marmalade.
2. Honey or molasses.
3. Brown sugar moistened with pineapple juice or sweet pickle juice.
4. One cup brown sugar mixed with one tablespoon prepared mustard.
5. One cup red jelly mixed with one-fourth cup hot water.

Fried Ham

Place ham slice, one-half to three-fourths inch thick, in skillet. Add water to cover. Bring to a boil and simmer for 15 minutes. Pour off water and pan-fry 10 to 15 minutes.

Red Gravy

To ham drippings in the skillet, add one teaspoon sugar. Stir until well blended. Add one fourth to one-half cup hot water. Pour over ham slice and serve hot. Be sure to serve hot biscuits—they should be part of this dish.

Cranberries may seem a bit too modern to use on an old-time menu, since they were in their infancy about the time the Lincoln family was deciding on a name for little Abe. Previously cranberries grew wild around Cape Cod. After more than 10 years of careful crop supervision, cranberries find many uses on American tables.

Old-fashioned cranberry sauce was usually in the form of jellied cranberries, and this still has a place all its own on our tables. Another popular version is strained cranberries, which look pretty and are a good accompaniment for any meat. Do not hesitate to make up a pound or two of cranberries at a time, since there are many uses for the sauce that is left, and it combines admirably with other foods to make varied and delicious relishes.

Spiced Cranberry Relish Mold

1 pkg. plain gelatin
1-4 cup cold water
1 one lb. can or 2 cups jellied cranberry sauce
1-2 cup raisins
1-4 tsp. cloves
1-2 tsp. cinnamon
juice of 1 lemon

Soak gelatin in cold water for five minutes. Dissolve over hot water. Crush cranberry sauce with a fork or beat with rotary beater. Add gelatin, spices, and lemon juice. Chill until partially firm. Plump raisins in hot water. Drain and add to gelatin. Pour into molds that have been rinsed in cold water.

Yield: four individual molds.

Cranberry Ham Mousse

1 tbsp. unflavored gelatin
1 3-4 cups bouilion or soup stock
2 cups cooked ground ham
1-4 cup celery, finely chopped
1-4 cup green pepper, finely chopped
2 tbsp. pimento
2 hard cooked eggs, diced
1-8 tsp. paprika
1-8 tsp. pepper
1 tsp. mustard, dry
1-2 cup heavy cream, whipped
2 cups eranberry sauce
2 tsp. grated onion

Soften gelatin in one-fourth cup stock or bouillon (cold). Heat the remaining stock to boiling; add softened gelatin and stir until dissolved; add grated onion or other desired seasonings. Chill until partially set. Beat cranberry sauce with a fork and place in bottom of mold. Place in a pan of hot water so that the sauce will melt, covering the dish. Or cut slices into cut-outs and arrange on bottom of mold. To the gelatin base, add the ham, celery, green pepper, pimento, and hard cooked eggs. Add pepper, paprika and mustard to whipped cream; fold into gelatin mixture. Pour on top of eranberry sauce in mold. Chill until firm. Makes four to six servings.

Cranberry Fruit Molds

1 one-lb. can or 2 cups jellied cranberrry sauce
1 envelop plain unflavored gelatin
1-4 cup cold water
1-2 cup hot water
1-4 tsp. salt
1-3 cup celery, diced
1-3 cup nuts, chopped
1-3 cup apples, diced

Soften gelatin in cold water; dissolve in hot water. Pour hot liquid over cranberry sauce in a bowl and beat with a rotary beater until smooth. Chill gelatin until partially set; then fold in salt, celery, nuts and apples. Turn into six individual molds to finish setting When firm, unmold on salad greens and garnish with curled celery and olives. Serves six.

BEAN COOKERY

Dried beans should be picked over before using, then washed. They may then be soaked overnight in water that is four times the volume of the beans. The water in which they were soaked should be used to cook them in. When cooked they should be brought to a boil over moderate heat then simmered over lower heat until they are just tender.

Deep Dish Cherry Pie

3 to 4 cups cherries
2-3 to 1 cup sugar
1-2 cup water or fruit juice
1-2 tsp. spices
1 1-2 cups flour
2 tsp. baking powder
1-2 tsp. salt
6 tbsp. shortening z
2 tbsp. sugar
1-2 cup milk
3 tbsp. butter

Remove pits and slice cherries. Add sugar, spices and fruit juice. Turn into a buttered casserole. Mix a soft dough using the remaining ingredients. Roll dough about one-half inch thick and lay dough over the cherries Sprinkle with sugar and bake about one hour.

French Onion Soup
(Serves 6-8)

6 medium sized onions. sliced
3 tablespoons butter or fortified margarine
1 qt. boiling water
5 bouillon cubes
Salt and pepper
Dutch rusks or Zwieback
Grater Parmesan or Italian style cheese

Slice onions into thin rings. Saute in butter in large frying pan or heavy saucepan until golden brown. Stir frequently to cook evenly. Add water and bouillon cubes. Bring to a boil and simmer 15-20 minutes. Season to taste. Pour into soup dishes or pottery bowls. Float rusks or Zweiback on top. Sprinkle generously with cheese.

Swedish Meat Balls
(Serves 6-8)

3-4 pound ground beef
3-4 cup crushed crisp cracker crumbs
1-4 eup minced onion
3-4 teaspoon corn starch
Dash allspice
3-4 cup top milk
1 egg slightly beaten
1 1-4 teaspoons salt
1-4 cup fat (drippings or salad oil)
2 beef bouillon cubes
3 cups hot water
1-8 teaspoon pepper
3 tablespoons flour

In a mixing bowl blend together the first 7 ingredients and 3-4 teaspoon of the salt. Shape into 30 or 32 small meat balls no bigger than the size of a fifty-cent piece. Melt fat in frying pan and brown meat balls a few at a time. Remove browned balls to a plate and brown another batch. When all balls are browned, return to pan. Dissolve bouillon cubes in hot water, season with remaining salt and pepper and thicken gravy with a smooth paste of flour and a small amount of cold water. Serve over spaghetti.

Spanish Rice
(Serves Six)

1 cup rice
3 tablespoons shortening
1-2 cup diced onion
1 No. 2 can tomatoes ((2 1-2 cups)
1-3 cup sweet pickle relish
1-2 cup diced pimento
1 teaspoon salt
Dash cayenne.

Wash rice; drain thoroughly. Heat shortening in a heavy skillet; add rice and cook, stirring constantly, about 10 minutes or until lightly browned. Add onion and continue cooking until onion is lightly browned. Add remaining ingredients and mix well. Turn into a greased easserole. Bake in a 375 degree F. oven 40-45 minutes.

Grace is one of the great words of the New Testament and calls for special emphasis. Let us notice what is includes: G, R, A, C. E. Grace means gift as the principle redemption as the purpose, acces as the privilege, eharacter as the product, and eternity as the prospect. Let us constantly glory in "the gospel of the grave of God" (Acts 20:24).—W. H. Griffith Thomas

CABBAGE BOWL SALAD

Pretty to look at—and so-o-o good with fresh FRESH Blue Plate Mayonnaise

1 medium-large cabbage
1 tablespoon minced onion
1-4 cup chopped green pepper
1-2 cup Blue Plate Mayonnaise

Select a eabbage with loose outer leaves. With a sharp knife, remove inside of cabbage, leaving a shell three or four leaves thick. Shred 2 cups of this center cabbage. (Save remainder and served cooked at another meal. Mix shredded cabbage with onion, green pepper, and Blue Plate Mayonnaise; pile lightly into the cabbage shell. Top with additional Blue Plate Mayonnaise before serving. Serves 4.

PEANUT BUTTER CHOCOLATE BROWNIES

A double taste treat! Rich chocolate plus "fresh-roasted" flavor of Blue Plate-Peanut Butter

3-4 cup sifted flour
1-4 teaspoon double-action baking powder
1-2 teaspoon salt
2 eggs
1 cup sugar
1-4 cup Blue Plate Peanut Butter
1-4 cup melted Blue Plate Mayonrine or salad oil
2 sqs-unsweetened chocolate melted
1 teaspoon vanilla
Powdered sugar (optional)

Sift flour, baking powder, and salt together three times. Beat eggs, add sugar, and beat thoroughly. Blend melted margarine or salad oil into Blue Plate Peanut Butter. Stir into egg mixture with melted chocolate and vanilla. Mix well. Stir in dry ingredients, blending thoroughly. Spread batter in greased shallow baking pan, and bake in moderate oven (350 degrees F.) about 25 minutes. If desired, sprinkle with powdered sugar immediately after baking. Cut into 16 squares. (Smooth Blue Plate Peanut Butter blends quickly with other ingredients—specially helped in eooking.)

GLAZED PORK LUNCHEON LOAF

Low-cost main dish—with temptin' taste of Blue Plate Jelly

1 can pork luncheon meat
3 tablespoons Blue Plate Jelly (Apple or other flavor)
1 tablespoon orange juice
4 tablespoons hot water
Cloves (optional)

Remove meat from can and place in a baking dish. If you wish, score the top in a diamond pattern, as you would a ham, and stud with cloves. Blend Blue Plate jelly and orange juice, and pour over meat. Pour hot water in bottom of pan, and bake uncovered in moderate oven (350 degrees F.) 30 minutes, basting several times with the liquid in the pan. This basting allows your meat to absorb the fine, true-fruit flavor in Blue Plate Jelly. Serves 4.

FRIED PEANUTS EXCELLENT TREAT

French fried peanuts give a treat that isn't only delicious and different, but can be quickly and easily fixed.

Mary Hulsey, API, extension nutritionist, says to heat fat as for French fried potatoes, put raw shelled peanuts, about half-pound at a time, in a wire basket and lower into hot fat. Cook until skins are slightly broken and nuts are golden brown. Drain on brown paper and sprinkle with salt.

Peanuts are healthful, plentiful, and rather inexpensive and can be used in many ways, adds Miss Hulsey.

WINDOW-SILL CHIVES

Chives may be grown in a pot indoors in winter and used for flavoring scrambled eggs, cottage cheese, cream cheese, salads, and other dishes.

CRANBERRY RELISH

2 cups sugar
1 cup water
1 stick cinnamon
1-4 teaspoon whole cloves
4 cups cranberries
1 cup celery, finely chopped
1 cup ground carrots
1-2 cup chopped almonds

Combine sugar, water, cinnamon and whole cloves in saucepan. Boil for 2 minutes. Add cranberries. Cook until cranberries pop open. Remove from heat. Chill. Then stir in celery, carrots, and almonds. Pour in covered dish and store in refrigerator until ready to use. This relish will keep for weeks properly stored in the refrigerator.

SAUSAGE AND RICE

1 cup uncooked rice
2 1-4 cups boiling water
1-2 teaspoon salt
1-2 to 1 pound sausage
1 green pepper, chopped
1 small onion, chopped
1 cup milk

Stir the dry rice into rapidly boiling, salted water. Cover loosely and let cook at a slow boil for 20 to 25 minutes, stirring occasionally with a fork. Remove lid reduce heat and let rice stand for 5 minutes to dry out.

Cook sausage partly done in frying pan, drain off most of the fat, then add green pepper and onion and cook for a few minutes. Mix with rice, then place half the mixture in a greased baking dish. Add layer of sausage, cover with remainder of rice, and add milk. Cover and bake in moderate oven (350 dregees) for 30 minutes; then uncover and continue baking for 30 minutes.

WINTER SALAD BOWL

1 1-2 cups shredded, scraped raw parsnips
3-4 cup diced celery
1-3 cup minced onion
8-10 small stuffed olives, sliced
1-2 teaspoon salt
Dash pepper
1-4 cup French dressing
1-4 cup mayonnaise
1 small head lettuce

Use medium-course shredder for parsnips. After shredding, combine them with diced celery, minced onion, salt, and pepper. Combine French dressing and mayonnaise; add to parsnip mixture, and toss well. Serve in nests of lettuee.

GOOD TEAMMATES

Peanuts team up with a good many foods. They are delicious in cole slaw or sprinkled over creamed onions or ereamed eggs and they are a must for curry.

A good flavoring combination for fricasseed chicken is a erushed bay leaf and a dast of thyme, and sage along with salt and pepper.

Gingersnaps spread with apple butter make an excellent afterschool snack.

The best working surface height for the average womans kitchen tasks is 36 inches from the floor.

Housewives do not always realize that the quality of oranges does not differ by size. Small oranges, for instance, are often extremely juicy.

Keep electrie cords dry. A wet cord is dangerous and may cause a short circuit. Also moisture may damage the protective covering over the wire.

WINTER CENTERPIECE

A low white pot of ivy on an attractive plate makes a eharming table centerpiece and helps out when fresh flowers aren't available.

NEW YORK STATE COLLEGE OF AGRICULTURE JUN 29 1948

T.M. Campbell, Extension Service Field Agent Presented Award

Presentation Was Made at First Annual Honor Awards Ceremony

Washington, D. C. In recognition of his outstanding agricultural extension work, T. M. Campbell, Extension Service field agent, was presented a Superior Service Award last week by Secretary of Agriculture Clinton P. Anderson.

The presentation was made at the first annual Honor Award Ceremony on the Washington Monument grounds. Although, 33 of the Department's 76,000 employees received Superior Service Awards, five received Distinguished Service Awards, and 124 received Length of Service Awards. Of this latter group, one has served the Department for over 50 years, and the others have served for 40 or more years.

In making the presentation to Mr. Campbell, Secretary Anderson said, "For your outstanding extension work among colored farm people, I present you this Superior Service Award. This is not for just doing a good job, but for work considerably over and beyond the call of duty. You have my good wishes and the good wishes of the entire Department." The award consisted of a certificate, a medal, and lapel pin.

Among the 1,500 who witnessed the Honor Awards Ceremony were Mr. Campbell's wife and two of their five children. The two daughters present were Miss Rose Elizabeth Campbell, a physical therapist, and Mrs. Emily Virginia Hawkins, a registered nurse.

Along with his Superior Service Award, Mr. Campbell also received a Length of Serviee Award for having served the Department for 41 years. He was the first colored extension worker employed by the Department.

It was on November 12, 1906, that

(Continued On Page 4 Col. 5)

Receives Superior Service Award

Secretary of Agriculture Clinton P. Anderson, congratulates T. M. Campbell, Extension Service field agent, after presenting him a Superior Service Award for his outstanding agricultural extension work. The award was presented last week on the Washington Monument grounds during the Department of Agriculture's first Annual Honor Awards Ceremony. Only 33 of the Department's 76,000 employees received Superior Service Awards, seven received Distinguished Service Awards, the highest honor, and 124 received Length of Service Awards for serving the Department 40 or more years.

County-wide Meeting On "Correcting Your Soil for Larger Returns" Held Recently

Monroe, La.— A county-wide meeting on "Correcting Your Soil for Larger Returns" was held on Thursday, March 25th, at 10:30 A.M. with thirty farm leaders from different sections of the County attending, Mr. E. F. Goldston, Extension Soil Speeialist of Raleigh, was the main speaker. He spoke on "Soil Use and Management." His speech was very interesting and inspirational. In his speech he brought out the following: "It takes 10,000 years to produce one foot of soil and it has taken 40,000 years to form the soil that we are now working. That there are two kinds of erosion—Sheet Erosion and Gulley Erosion. Both are bad. When we let our land wash away the top soil, it leaves only the sub soil and to work the sub soil we have to have heavier workstock and farm implements and we will get poorer crops. Our fertilizer bill will go up and yields will go down. Strip farming saves our soil. Sub soil is droughty, it is either too wet or too dry. Use commercial fertilizer and manure. Manure is the best fertilizer. Already we have ruined our best land. We must change our land use and put our crops on the land best suited for their production." These are the Union County erosion conditions that he gave: There are 411,000 acres in the county. 86.000 acres have not been injured to a great extent by erosion. 98,000 acres have lost one-third of its surface soil. 144,000 acres have lost from one-third to two-thirds of its surface soil.. 82,00 acres have lost from two-thirds to all of its top soil and a part of the sub soil. This is a bad picture. We must change our methods. In closing he asked, "What are our children and grand-children going to have to farm on? Each of us should stop and think about this."

Mr. C. H. King, Soil Conservation Specialist of USDA of Monroe spoke on the benefit and service that you can get through the soil conservation service. He emphasized contour farming strip farming, more and better permanent pastures, field borders for wildlife, and reforestration. He said the following: "The more good pastures we have the more livestock we can have and we'll have a better income and more prosperous years ahead. Thin the forest on your land. Cut out the crooked trees for wood, leave the good straight trees. Most of our woods are gone. When there is not enough woods on your land and you have enough land, set out an acre or two of pines. Lime, fertilizer, and good seed are recommended for good crops. Strip farming saves your land. Plant a field border to feed our wildlife, as they are our friends. Farm around the slope of your field and not up and down it. Cooperate with the Extension Service and A.A.A. The A.A.A. will pay so mueh for different soil conservation practices on your land."

Negro Farm Leaders Discuss Long Time Farm Program

Raleigh, N. C. Negro farm and home leaders representing 10 Wake County communities met in the office of the Negro Farm and Home Agents reeently to discuss the problems affecting the county. Bartel Lane, President of the County Council, presided over the meeting.

Background information and the present situation of the county was presented by W. G. Davenport, Negro County Agent, and Mrs. A. B. Alston. Acting Negro Home Agent.

As a result of the present situation the leaders spelled out the problems that affected their communities and set them up in the long time planning program.

The communities and problems involved are Shiloh; hay and grain: Jefferies Grove: housing, milk and feed; Eagle Rock; hay, corn, hogs and vegetables: Springfield: toilets, gardens, sanitation and land tenure; New Hill: farm roads; Apex: eows and poultry; Fletchers Grove: toilets and screens; Sandy Fork: food, feed and land ownership; Friendship: farm records; and, Fuquay Springs: hay, sweet potatoes,

Anderson Proposes Measure To Help Bakers Save Wheat

Secretary of Agriculture Clinton P. Anderson has proposed a tentative voluntary industry agreement for the more than 12,000 wholesale bakers of bread, rolls, pies, cake, yeast sweet goods, and doughnuts. The principal purpose of this proposed agreement is to conserve wheat through elimination of consignment selling.

The suggested agreement calls upon wholesale bakers to refrain from the practice commonly known as consignment selling. Provisions of the agreement would exclude the return of stale bread from retailers in excess of one percent of gross sale in any calendar month, and would request bakers to limit inventories of flour to 60 days' production requirements.

It is estimated that elimation of consignment selling would save 10 million bushels of wheat over the 12 month period for which the agreement is proposed. Inventory limitation would tend to act as an anti-inflationary measure.

Negro Farm Youth Observed Successful 4-H Club Week

Washington, D. C. The Nation's 300,000 colored 4-H club boys and girls observed National 4-H Club Week, March 1-7, according to reports received by the U. S. Department of Agriculture from the State Extension Services.

Radio broadcasts were made in some States, 4-H sermons, discussion meetings, and other activities were held in others. The Negro staff of Alabama Extension

Only One-Third of Farm Families in Ga. Have Adequate Diets

That tenants and sharecroppers need the kind of security on the land that will encourage more of them to grow a larger part of their own food supply is indicated by a U. S. Department of Agriculture survey which reveals that nearly two-thirds of the colored farm families in a sample Georgia eounity had inadequate diets in 1945 a high production war year.

The survey shows that only 35

Only High Rate of Cotton Merchanization Can Sharply Reduce Need For Land-Labor

Washington, D. C. Although the agricultural trend is definitely toward further mechanization, only a high rate of adoption of the mechanical cotton picker can sharply reduce the need for hand-labor in the South within the next few years, says a publication issued recently by the U. S. Department of Agriculture.

The new publication — — — — Progress of Farm Mechanization— points out that despite 100 years of substituting machines for animal and human power, 61 percent, or 13 billion hours of the farm work were still being done by hand-labor four years ago.

However, the study indicates that increased mechanization will further reduce hand-labor in agriculture. There is an outside possibility that it may eliminate two to three billion hand-hours during the 10-year period, 1944-54, providing the mechanical cotton picker comes into general use, and the trend of eliminating hand-labor is speeded up through the country, the publication asserts.

Pointing to the labor requirements for maintaining the more complicated farm machines, the publication says that although two or three billion more hours of hand-labor may be eliminated throughout agriculture as a result of the adoption of mechanization, it would probably mean a net reduction of only one-third to one-half as many hours.

Least reduction in hand-hours requirements will take place in the performance of such farm chores as caring for sheep, poultry, and cattle, and in cultivating and harvesting such crops as sugarcane, potatoes, dry beans, fruits, and vegetables.

State Helps Free Herds Of Mastitis

Dairymen interested in reducing losses in production and eventually having a herd free of mastitis should follow the procedure outlined by Dr. A. A. McMurray, director of the State Department of Agriculture mastitis control program.

Farmers desiring assistance should follow the procedure outlined by Dr. A. A. McMurray, director of the State Department of Agriculture mastitis control program. Farmers desiring assistance should make their wishes known in writing directly to the department or request their county agent, vocational agricultural instructor or other farm representatives to request service for them.

A representative of the mastitis control program will then visit the dairyman and will work out a "gentlemen's agreement" whereby the dairyman agrees to to follow a proven program in sanitation and management.

There is nothing binding about the agreement. It may be terminated at any time by either party.

When an agreement is established, the Department of Agriculture employe will examine the herd and give advice on how to manage that herd to eliminate, control and prevent mastitis. He will attempt to determine the amount of infection as well as the cause.

The dairyman is given instructions in herd management practices whch include treatment of the udder at milking time.

Periodic visits will be made to check the herd and laboratory tests will be conducted.

"All services provided are free and we are now in position to render services to any dairyman in the state," Dr. McMurray said. However, it is essential for dairymen to cooperate in the sanitation and management program outlined by the department, he explained.

"We are confident that our program will work because it has proven very successful in many herds during the past two years," Dr. McMurray declared.

Warm Weather Fire Hazards

Fire loss in this country is naturally at its peak during the winter, when heating plants are being used to the limit. But the approach of the warm season brings special and very dangerous hazards.

Many homes and businesses have been destroyed because the grass wasn't cut on adjoining vacant property and caught fire. Every community should have a suitable law in this regard and enforce it strictly and impartially.

Carelessness in burning rubbish during dry days takes its share of the toll. Such fires should never be left unattended. And some means of controlling or quenching them if they threaten to get out of hand should be immediately available.

Spring and summer will witness a tremendous increase in tourist travel through the rural areas and timbered country. Millions of acres of splendid timber have gone up in smoke, leaving nothing but an ugly, scarred landscape as a memorial, because people have thrown burning matches and cigarettes from cars, and because campers haven't made absolutely sure that their fires were out before moving on. These crimes of carelessness are covered in the law—but police and forest service officials can't be everywhere. Fire prevention, in all its many phases, is up to the individual.

When spring clean-up time comes, do a real and thorough job of it. Get rid of the junk and the refuse. A clean house and clean premises mean fire prevention.

EGG WITH '16' ON IT LAID ON FEBRUARY 16

Union City, Tenn., March 1 (Special) John Harrison of Grace, Ky., recently displayed a hen's egg with the number "16" naturally imprinted in the shell.

When was the egg laid?

You guessed it - February 16.

Black Market in Farm Machinery Flourishes

Chicago, Ill.—(AP)—Farm equipment manufacturers said yesterday there is a flurishing black market in farm machinery, and they are powerless to stop it.

The manufacturers said they are running their plants at full capacity and expanding their production facilities, but they have been unable to satisfy the huge demand.

Most black market sales are made by farmers and individuals, rather than authorized dealers, the manufacturers said. Farmers need equipment so badly they are willing to pay $1,000 or more for slightly-used tractors and combines, they said.

The farm equipment makers said they would tell their story of the black market to the house agriculture committee in Washington next week. Rep. Clifford Hope (R-Kansas), committee chairman, sent out investigations to the manufacturers and announced his committee would begin public hearings on the farm Black Market Feb. 10.

Most of the big companies including international Harvester. Allis Chalmers, Caterpillar Tractor and J. I. Case, are expanding their production facilities in an effort to meet the demand.

International Harvester opened a tractor plant at Louisville, Ky., last fall and expects it to reach a maximum production of 50,000 units per year by next fall.

Caterpillar spokesmen said the company is building two big new expansion programs which is expected to "greatly increase" production.

Manufacturers said the steel shortage was a contributing factor in the shortage of farm machinery, but that many factors are responsible. During the war the plants were occupied almost entirely with war production. In 1946, seeveral of the major companies, including Allis Chalmers and J. I. Case, were beset by strikes.

A spokesman for International Harvester said the company's dealers in all sections of the country had reported evidence of black market operations.

An official of Deere and Co., at Moline, Ill., said the black market moves around the country with the harvest seasons. When southern farmers have their crops in, he said, they are tempted to sell equipment at high prices to northern their crops.

A caterpillar Tractor representative said that the black market is equally common in the sale of road graders and highway equipment. He said he had seen heavy equipment salvaged from the war advertised for as high as $4.000 above the list price.

All the major companies said they were urging dealers to sell only to farmers with a legitimate need. Some of the companies have run advertisements urging farmers to pay no more than the list price.

Farm Talk with Farm Folk

By Jesse Safley

Beef cattle took the limelight, agriculturally speaking several weeks ago in Middle Tennessee. Three breeding association consignment sales were conducted with gratifying and stimulating results.

Prices were good but not excessive considering the quality of the animals. Unlike other sales the average farmer could make purchases and many did.

Interest in beef production and better grade animals has definitely grown. This was proven conclusively by the large crowds attending the sale. However, many would be breeders of better livestock continue to sit on the sideline and for one reason or another delay their purchase of foundation livestock.

A farmer who "looks before he leaps" is displaying sound judgment. However, some are a bit too cautious when they continue to wait year after year.

Profitable beef programs are devcloped through sound, long-range planning. A desirable program can seldom be bought. The average farmer is not financially able to buy many animals at prevailing prices. Since he starts with a few animals and attempts to develop a top quality herd, is essential that thosc animals be of desirable quality.

It is difficult to correct a mistake in any livestock breeding program. Any farmer who is not sure of his ability to select good individual animals should rely on the judgment of someone versed in the field of a dependable breader.

Breeders are not going to mis lead a beginner. This is true in most cases. Breeders realize that it is to their advantage for a new breeder to start out right. He is not only a potential buyer, but his success will detremine to a certain degree the opinion of others about the breeder gave him a start in the business.

There are at least two groups of farmers who should make changes in thir farm program. One is the man who year after year continues to grow row crops on marginal and sub-marginal land. The other is composed of those farmers who struggle along with a herd of cull animals which in the long run don't pay for their feed bill.

There is room for better beef cattlc throughout thc state. The owner of low grade herds, if nothing else, could purchase a desirable sire. It would be only a short time before there would be noticeable improvement.

More farmers should realize that a cull animal will consumc as much food as a good one. The difference comes when it is time to sell. The better bred animal will not only become heavier on the same amount of feed, but it will demand a better price in most cases.

More farmers are realizing that money from beef cattle is made from grass and not so much from grain. They no longer feel that it is necessary to produce corn to carry the cattle through the winter. A good grade of hay will do the job just as efficiently and is much less trouble and less expensive to produce.

Any farmer in the beef business should be sure of ample pasture to care for all of his cattle. This is especially true for the beginner. He will have enough problems without worrying about feed.

There are thousands of acres in Tennessee devoted to the production of corn and other raw crops that should by all means be in pasture. The average yield for all corn produced in the state last year was less than 30 bushels per acre. Knowing that many acres produced 40, 50, 60, 70, and even 80 bushels, we realize that corn was grown on many acres that yielded 10 and 12 bushels.

There is no profit in corn production when the yields are so low. In fact, the man who failed to make at least 29 bushels per acre didn't make expenses. His land would have been much better off in some type of grass. It wouldn't have washed away and the farmer wouldn't have had to do all that work.

Soil that has reached the unproductive stage for row crops can be developed into very desirable pasture It can be made profitable by grazing good livestock. Beef cattle production can bc both profitable and enjoyable with proper management.

DONT BOARD RATS

It costs $2 to board one rat for a year. This pest can be controlled at little cost.

Red squill is the safest and one of the best materials to use in poisoning rats. It is relatively harmless to other animals.

To make effective bait mix one pound of red squill with 9 pounds of ground beef, canned fish, rolled oats, or other food. The bait should be divided into pieces the size of a large pecan. Put a piece of bait in every rat hole that can be found and in other places rats have been seen. Every building on thc farm should be treated at the same time. Five to 10 pounds of bait will be enough to treat all buildings on most farms.

Chestnut Tree Stages Comeback in State

It is doubtful that the village blacksmith will ever be a principal figure in American communities again, but the return of the chestnut tree under which his shop stood is practically assured.

What's a chestnut?

Chestnut is the common name applied to one of the largest trees ever to grow in our southern forests. A tree which was valuable for lumber, tanning, fence rails, shade and many other things in addition to its nut crops. It has been essentially extinct for the past 12 to 15 years Chestnut blight was responsible.

After more than a decade of breeding work by specialists of the U. S. Department of Agriculture, several varieties have been produced which are almost resistant to the blight.

Cross-breeding blight-resistant Chinese varieties with the diminishing American varieties has brought these results. The new varieties will not attain the size of the original varieties nor are they as winter resistant. However all indications are that the tree will be of desirable size and will prove favorable on many southern farms in the years to come.

Breeding of the new "hybrid" varieties has been primarily for timber, but the importance of the nut crop has not been overlooked. Nuts from these trees are almost as large as the original American varieties and the quality is desirable.

State Horticulturist J. C. McDaniel says that some of the "hybrid" trees are already growing in the South with favorable results. can't have chestnuts in Tennessce

There is no question that we can't have chestnuts in Tennessee again," he said. "It will only be a matter of a few years because farmers are extremely interested."

We can't count much on the water-sprouts which are springing up in some localities from the old stumps, McDaniel said. Those trees are not blight resistant and sooner or later they will be killed by the disease.

He explained that reports of chestnut trees are numerous about the state and some have attained the bearing age but it is seldom they live that long.

Reforesting chestnuts will be a slow process because the seedlings are being produced at a slow rate at the present time. The demand for the blight resistant trees has been so great that no individual has had an opportunity to secure very many. Regardless, the chestnut is on its way back and for keeps unless some unforeseen disease appears on the scene.

Science Breeds 'Super Fly' To Learn How To Kill It

By Robert E. Geiger

Washington—(AP)—Science has created a "super" fly. It takes three times as much poison to kill him as an ordinary fly.

In producing this tough guy in a laboratory the scientists were running a race with nature. Nature, too, was turning out a new model fly every year. Each crop was harder to kill with the powerful new poison, DDT.

These poison-defying flies appeared in great numbers in Greece and Italy, where DDT was used in great quantities during and right after the war.

Scientists wondered whether this meant that some day there would be a breed virtually immune to poison. Such a fly might spread around the world and drive out all puny, ordinary flies.

Decides to Find Out

The United States Department of Agriculture decided to find out. The problem was to turn out flies faster than nature produces them and thus get a preview of future generations of flies.

Agricultural department scientists decided to use nature's law of the survival of the fit to do this. Now, after 43 generations, they probably have what is the champion muscle-flexing housefly of the universe. He's not only resistant to DDT and other powerful insecticides but he's healthy, hardy and robust, just like the Italian-Greek wild flies.

This new fly was produced within two years by the bureau of entomology and plant quarantine laboratory at Orlando, Fla. At least three years were clipped from the time it takes nature to produce 43 generations of flies.

Here's how the scientists did it:

They sprayed a colony of flies with DDT. There were a few survivors. These were permitted to rear families. Their offspring were sprayed. Once more a few survived.

Took Twice As Much

In the 36th generation it took twice as much DDT as it took to kill most of the members of the first generations. And now, in the 43rd generation, it takes three times as much.

Some flies survived simply because they were more robust than others. Another group survived apparently because they have thicker "skins," smaler "noses" or some other physical characteristic that prevents them from absorbing as much DDT as other flies.

So far as flies are concerned, the scientists don't believe the situation ever will become serious. There are too many flies, spread over too much of the world. But with other pests there is a major problem.

All sorts of insects develop an apparent immunity to poisons after they have been used on them for several years.

Killed by Science

When there is no hope of exterminating all members of some species of pests, in a few campaigns, because they are so widely and numerously spread, they will have to be killed by more scientific warfare. Flies come in this class.

Sacrifices to Fire

The trouble with statistics is that they are difficult to visualize. We read, for example, that more than 10,000 people are killed by fire each year. But that doesn't come home until we break it down, mentally, into individual tragedies that could happen to us, our families, and the people down the block.

Here are a few headlines, all taken from recent issues of newspapers, that illustrate better than argument the horror of fire:

"Concord, N. H.—Mother, Son Die in Fire."

"Sylvester, Ga.—Child Burned to Death in Home Fire."

"Tigard, Ore.—Fire Kills Two Men."

"Utica, N. Y.—Eleven in Family Burn to Death."

"Mallard, Ia.—Farm Hands Meet Tragic Death in Fire."

"Chatham, N. Y.—Five Persons Die from Stove Explosions."

"Oskaloosa, Ia.—Child Dies in Farm Home Fire."

"Marietta, Okla.—Farm Woman, Child Perish in Flames."

"Lewistown, Pa.—Trapped in Her Room, Child Suffocates in Early Morning Blaze."

"Dillon, S. C.—Two Children Lose Lives When Home Burns."

This list could be continued indefinitely. Great fires make the headlines nationally—but it is the "little," isolated blazes which cause most of the death and damage. And it can happen to you unless you use all precautions possible to prevent fire.

Power Improves Life On Farm

For many years the rural people of Center Star community, anxiously looked forward to the day when they would have electricity in their homes. The people of Center Star community have been rewarded for their patience. They now have an REA line running by their doors.

Many homes have already been equipped with electrical appliances such as, telephones, radios, electric irons, refrigerators and many other appliances.

The Home Demonstration Club of this community, will work to achieve economy and skill in the operation of their appliances.

Many Fine New Flowers Available for Gardeners

By Dr. Floyd Bralliar

Garden Editor
The Nashville Tennessean

It is now timc to begin work on preparing plans for this year's flowers and vegetables.

Fortunately we have a good array of interesting new flowers that are easy to grow to stimulate our interest. The first of these are the new tall growing bush type of Petunias, Pink Sensation. This is an entirely new type of petunia, decidedly different from anything we have ever had in the past. Under normal conditions it will make a plant two to three feet in diameter almost pyramidal in shape and in good soil the plants will stand high as 30 inches.

Delightful Shade

The flowers are three inches in diameter, a delightful shade of pink, and are abundantly produced. The plant stands heat well and blooms all summer. Now is the time to get the seed and plant them. Almost all of the seed houses handle the seeds in the packets only. Thcy should be sown like any other petunia seeds, in hot beds, cold frames, or indoor boxes.

Because petunia seeds are extremely small, and because the seeds of any novelties are more expensive of the older varieties, we think it always pays to put the soil in which we sow the seed through a screen or at least put enough soil through the screen to cover the top of the container at least an inch deep.

Level Soil Off

Level the soil off and sprinkle thc seed on the surface of the soil. Cover it just about the thickness of a knifeblade of the screened soil. Now lay a clean sterile cloth over the top of the place where the seed has been sown and water through the cloth. Now remove the cloth and cover the bed or box where the seeds have been sown with glass raised just enough to get a good circulation of air.

If it is necessary to water again before the seeds come up, put the cloth over it again and water the soil through the cloth. Just as soon as the seeds are up, remove the glass covering, and dust lightly with sulfur to prevent the plants snapping off.

We have given these directions in detail because the seeds are very small.

Another new flower that is well worth growing is the double snapdragon. It may not be as graceful as some of the singles, but does make a solid spike of bloom and is very much worthwhile especially as thc novelty for you can be sure none of your neighbors have seen them before.

Giant Tetra-Phlox

Another flower we have been watching with a great deal of interest for the last four or five years, is the new giant flowered tetra-phlox. This is a giant new type of the old phlox Drummondi, but the individual flowers and the clusters are so much larger than the old type and they are produced on stems so much longer that it places these quick growing free blooming annuals in a forefront either for bedding or for cut flowers.

Probably only the large mail order companies will be able to supply these seed this year, but they are well worth growing. These seed can be planted either indoors or outdoors as soon as the ground is warm enough to work. If the seeds are to be planted in the open ground, plant the latter part of April.

Gladiolus Planting

The first planting of gladiolus bulbs can be planted just as soon as the ground is dry enough to work, though we do not think anything is gained if they are planted before the middle or the last part of March. We are informed and careful experiments have proved that while gladiolus bulbs are allowed to lie in the cold wet ground for considerable time, they will probably all grow and bloom a week or 10 days later if similar bulbs are planted at the time we planted our early garden.

This is the time to prune all trees and finish up needed pruning that has not already been done. All trees may be pruned now without any danger of injury with the exception of maple trees. We do not recommend pruning them before the middle of March. They should have been pruned in December.

Go Over Trees

Go over all of your valuable trees carefully for dead, split, and broken limbs, or any other defects that do damages. Should you wait until the leaves come out, you will be pretty sure to fail to see some limbs that should be removed. Fertilize any trees that you know are not growing well right now so that the trees will have the benefit of the fertilizer as soon as spring growth starts.

If possible sct out all trees, any kind that you planned to set this spring between now and the middle of March. Experts or even average gardeners who do their work carefully may get reasonably good results up to the middle of April, but planting that late is always a big risk.

We are needing new vegetable gardens this year more than at any other time in the history of the country. Our government is urging very strongly that everyone who can possibly do so plant a garden this year, even though it is very small. We will write more fully about this soon but we wish to urge all our readers to get busy at once and decide where their garden is to be, and get ready to plant it.

Economic Highlights

Happenings That Affect the Dinner Pails, Dividend Checks and Tax Bills of Every Individual, National and International Problems Inseparable from Local Welfare

In every country in which the communist party is active—a category that includes practically all of the nations of the world—it works on the proven military principle that a small, highly-trained and disciplined force can easily control a large but undisciplined mob. This principle has demonstrated its soundness beyond question in communism's alma mater, the Soviet Union. The communist party within Russia has only a million or so members, but this little elite force has no difficulty in dominating the rest of the 190,000,000-plus Russians. And the party, in turn, is directed by a central committee made up of ten members and four alternates whose decisions are absolutely final, and from which no appeal can be taken.

Whether or not communist parties outside of the Soviet Union are actually directed from the Kremlin has been the subject of much acrimonious argument. It doesn't make a great deal of difference either way, for the pattern is always the same. It has been definitely proven that some communist leaders have been given their training in Russia and then sent abroad to the United States and other countries to spread the gospel. These leaders are chosen for various qualities—intelligence, ruthlessness, the ability to lead and sway others, and above all, for a passionate, religious faith in the communist doctrine.

Many people used to doubt communism's effectiveness on the grounds that it would be impossible to obtain converts on even a small scale in a country such as the Untied States. Circumstances have blasted that point of view. The communist leaders have found a following among two cntirely different kinds of people. Thc first kind consists of intellectuals with a burning dcsire for Utopia who can be persuaded that Karl Marx, as edited by Stalin and company, has pointed the way. These people are carefully trained as editors, manifesto-writers, speakers, and leaders of sub-groups.

The second kind consists of people who for one reason or another are bitter at the world, feel that society has cheated them, are envious of others, and are eager to take part in any movement that promises to make them top dog in some blazing future dawn. These are the private soldiers in the ranks of communism.

The care and raising of a new communist is almost as routine as the multiplication table. At the beginning there is considerable accent on social life—many of the members have been lonely, and every effort is given to making them feel welcomed and wanted. The blandishments of wine, women and song are used freely. They are stimulated by conversation which is above their heads, and soon develop an eagerness to learn so that they may become the mental equals of their teachers. They are initially fed Marxism in kindergarten-sized doses—except, of course, in the case of the intellectuals who begin with an adequate background. Injustices, real and imaginary, in American life are pointed up and pounded home.

Step by step, the converts moves along. Soon he is given easy, minor tasks, such as helping to distribute communist literature and to form part of a claque at meetings. Almost unconsciously, he takes on more and more work. Communism assumes an ever-growing role in his life. If he is the right type, he is eventually used to do some organizing on his own hook, often in the place where he works. He is taught how to look for other dissatisfied workers and to subtlely prepare them for immersion in the cause. He may be employed for strong arm jobs, such as heckling and breaking up meetings of anti-communists.

Finally, he discovers that communism is his world, and that everything else is secondary. He finds that his superiors expect him to be a communist 24 hours a day, that there is no limit to the work they may give him, and that they must be obeyed without question. When that point is reached, he is considered of real value to the organization.

If he becomes disillusioned and wishes to drop his affiliation, he finds that extremely difficult, calling for a degree of courage and will power that few human beings possess. Every conceivable form of social and economic pressure will be brought against him and his family. He will be subjected to threats—and he will know, from previous examples, that the threats are carried out to the letter. In some cases, the penalty for dissent may be liquidation. In the Soviet Union itself, that is almost always the penalty.

That, in general, is the way communist cells are built. A large membership is not desired—small groups with the right kind of training and indoctrination are far more easily handled. And when the time for action comes, the communist cells can act with incredible purpose and efficiency. Nothing is left to chance. Everything is planned, and the task of every member is clearly detailed. It was last done that way in Czechoslovakia, and the world now knows the result.

Finally, the communists are masters at using other groups to their own ends. Many a well-meaning liberal has advanced the communist cause without realizing it. If he finds out what is going on and protests he is expertly reviled and painted a black reactionary. Communism skillfully plays every angle which may help it, no matter how indirectly.

Uncle Sam Looks for About 12,000 'Lost' Farm Hands

Washington, April 5—(AP)—Uncle Sam is looking for about 12,000 "lost" farm hands.

They were among more than 300,000 agricultural workers brought in from Mexico and the West Indies during the war and since to help meet a farm worker shortage.

Recruited under the direction of their respective governments, they were given permits to enter this country for only a specified period of time. And they were supposed to return to their respective countries after the harvesting season.

So far neither the Agricultural Department nor the Immigration Service has been able to find the 12,000. Most of those missing are from Mexico.

Sumter County 4-H Clubbers Hold Club Field Day in Americus, Georgia

Americus, Ga., Friday, April 9 was a great day for Sumter County Negro 4 H Clubbers, rural teachers, rural children, farmers and farm women. Several thousand rural Negroes flocked to Americus to observe the county wide 4 H Club Fields Day, and to participate in a full day of activities, characterized "to make the best better", and to improve the head, the heart, the hands and the health of all. It was the greatest peace time demonstration ever staged by the Negroes of Americus and Sumter County.

Nature even smiled on and blessed the program. The crowded snowy cumulus clouds which had been hanging above, threatening to deliver a down pour of rain, silently disappeared, and gave way to "Old Sol", who came out and beamed down on the hundreds of spectators who lined the sidewalks awaitng the glaring blare of the music.

Under the direction of Charles Brown, ably assisted by Henry Harris and other rural leaders, at 10:00 a. m. led by the famous Staley High School band, the huge and glamorous parade started up Forsyth Street. Horses, jeep, trucks, cars, floats, 4 H clubbers, with banners, rural teachers and rural leaders, rolled slowly and marched majestically to the tempo of the music of the Staley High School band. The floats representing the Sumter County 4 H Council, Leslie Public School, Mt. Mary, the decorated cars and trucks, were acclaimed by the many spectators as worthy representation of careful planning and much hard work. A conservative estimation of 1200 persons participated in the parade.

At the termination of thc prade, the huge mass of humanity journeyed to the auditorium of Staley High School to participate in the indoor activities. This program started with the singing of "America" followed by prayer. Maxine Dorsey was in charge of music. Milton Raven, president, Sumter County 4 H Council extended greetings, and also led the 4 H Club motto and pledge. With Leila Bobbs Holmes, presiding, a program, consisting of group singing, public speaking, spelling bee, health plays, stunts, and exhibits was rendered. The principal and only address was delivered by E. L. Bridges, superintendent of the Sumter County Schools. He praised the caliber of work that is being out among the clubs, urged the group to support any worthwhile program, outlined the advantages of education, and emphasized the urgent need of the folk in Sumter County following a sane and sound leadership which will bring about substantial improvement, and racial goodwill. Included among out of town guests were J. W. Harris, Negro County Agent, Terrell County; J. C. Sanders, former teacher of vocational agriculture at Shipp Training School, but now, Negro County Agent, Mitchell County Augustus Hill, assistant Negro State 4 H Club Agent; George S. Oettle, a native of South Africa, who was sent to Sumter County to observe the program, and study the 4 H club activities.

In the afternoon, time was devoted to outdoor activities, which consisted of potato race, sack race, suitcase race, 50 yd. dash, high jump, broad jump, and two basketball games, played between the boys' and girls' teams, representing Nunn Industrial School and the Plains Rosenwald School.

Leila Bobb Holmes, president, Sumter County Teachers Association, Trixie Seay, chairman the committee on arrangement and planning, F. M. Staley, Negro County Agent, Nora Ruth Mathis, Home Agent, Charlie Brown, marshall of the day and Henry Harris, vice president, the Agricultural Planning Committee, express their highest appreciation for the cooperation of Staley High School band, the rural teachers, the state officials, county and city officials, and all who worked to make the whole affair a most brilliant success.

Winners for the day: Spelling—Seay, first; Davis Grove, second.

Public Speaking — Long Grove, first; Piney Grove, second

Singing — Davis Grove, first; Mt. Mary, second.

Health Play — Paradox, first; Huntington, second.

Stunts— Shipp Chapel, first; Plains — Rosenwald, second

Potato Race — Plains Rosenwald

Suitcase Race — Plains Rosenwald

High Jump — Nunn Industrial, Long Grove, Plains Rosenwald (tie) Broad Jump -- Welcome

50 yd. dash — Nunn Industrial

The activities of the day were climaxed with two basketball games, played between teams, representing Nunn Industrial and Plains Rosenwald Schools, to determine the girls' and boys' championship teams of Sumter County. Nunn boys and girls captured both championships, by defeating the teams from Plains, winning the girls' game by a score of 7to6, and winning the boys' game by a score of 11 to 6.

Paris Green Halts Garden Cutworms

Losses in early gardens because of cutworms can be reduced through the use of Paris Green bait. One pound of Paris Green to 25 pounds of course bran will do the job. For small areas use one tablespoon of poison with one pound of bran.

Enough water should be added to moisten the mixture but not enough to cause it to lump. Apply the bait late in the afternoon. For best resuts the treatment should be made a day or two prior to setting the plants or just before they come through the ground.

Grain Sorghum

Get grain sorghum seed to plant the middle of June. There will be good insurance against a feed shortage.

Feed Tight

The feed situation will be tight in 1948. One of the best and easiest ways to produce some emergency feed is by planting an annual lespedeza on prepared land and on small grains.

SOIL SAVING

Much of our cropland will not be protected by a cover crop this winter. However, a great deal of soil can be saved if cotton and corn stalks, crotalarie and other residues are cut or disked into the ground now. This material will decay and make land preparation easier next spring.

Clear pastures of brush stumps, and loose stones to make mowing easier next season. On many farms the acreage of grazing may be increased by clearing low, wet areas, and then preparing, liming, fertilizing and seeding them to pasture.

Negro Holds Army Physical Perfection Record

Chicago, Ill.—The first man to make a perfect score in the army's gruelling paratrooper physical test is PFC Chester W. Oden, St. Paul Negro, according to a June Ebony feature which declares that the super-trooper's name flies on a pennant atop the Airborne Training School at Fort Benning to honor his feats.

"All aspirants for paratroops must pass a test that includes 54 push-ups, 75 squat-jumps, 20 pull-ups and 79 sit-ups in a space of two minutes," Ebony says. "They must also run a 300-yard shuttle course in 44 seconds."

First man, Negro or white, ever to make a perfect score of 500 on this strenuous test, PFC Oden was also a four-letter man at Father Flanagan's Boys' Town. He entered the army in February, 1947, and volunteered for the paratroops.

THE FORUM

The Modern Farmer

Published monthly by the Modern Farmer at Nashville 3, Tennessee.
Giles A. Hubert,_____ Contributing Editor
Sadie Wilson _____ Secretary
Henry Allen Boyd_____ Publisher
Office, 403 Charlotte Avenue.

Devoted to the interests of the Farmer, Truck Gardner, Livestock and Poultry, Breeder, the Home and the People.

Entered as Second Class Matter, April 10, 1929, at the Post Office at Nashville, Tenn., under act of [illegible] 3, 1879

All contributions for publication in the Modern Farmer, should be addressed to The Modern Farmer, 403 Charlotte Avenue, Nashville 3, Tenn.

No libelous matter will be published. Unsigned articles or letters, and those written on both sides of the paper will not be used.

Subscription price $1.00 per year, 75c for six months, payable in advance. Personal checks must be certified. Make all checks or money orders payable to The Modern Farmer.

Advertising rates and sworn circulation figures presented upon application.

Negro Farm Youth

(Continued from page 1)

Service launched the observance in that State with a broadcast over Station WAPI of Birmingham, Saturday, Feb. 28, 1:30 p. m., CST. Charles E. Trout, assistant extension editor, interviewed a 4-H club leader and a county agent on the activities being caried out by 4-H'ers.

One of the highlights of 4-H Club Week was the inventorying of projects completed in the past and the checking up on the progress of current projects. Reports for the 1946 farm year—latest available—show that during that year, 99,000 colored 4-H boys and 132,000 girls completed a total of over half a million projects.

These projects included 115,000 acres of crops and gardens, the raising of nearly two million head of poultry, 50,000 head of hogs, and 10,000 head of beef and dairy cattle. Also, 276,000 garments were made and an additional 116,000 article of clothing were remodeled or made-over.

In line with this year's 4-H theme—"Creating better homes today for more responsible citizenship tomorrow"—colored farm youth completed 30,000 projects in home and lawn beautification in 1946 and made 100,000 articles of home furnishings. Also, 4-H club girls eanned 3,190,000 quarts of food and served 3,400,000 meals.

In farm shops, colored 4-Hers made 4,000 farm tools and repaired 7,000 plows, wagons, tractors, and other farm implements. Department officials point out that this type of training will be of increasing value as mechanization advances in the South.

Of the 1,600,000 4-H clubbers of the Nation, 299,000 are colored. They hold membership in 8,853 clubs in 446 counties in the South. Four H membership is not limited to the children of farm operators. Rural non-farm youth also may join. At present 37,000 non-farm youth hold membership in 4-H clubs.

To save frosting a cake sprinkle the batter with finely chopped nuts before it goes into the oven.

Only High Rate

(Continued from page 1)

Greatest reduction in hand-labor will be effected in the farming of cotton, corn, wheat, and peanuts, the publication states.

Caring for livestock required the greatest percentage of hand-labor. Seventy-five percent of the man-hours spent in livestock work on farms in 1944 were hand-labor. While hand methods in crops consumed 47 percent of the total hours devoted to erop production.

To eliminate more hand labor in livestock care, says the publication, would mean more and better feeding and watering conveniences, more use of milking machines, and more mechanization in the performance of other chores around the barns. With greater coverage in rural electrification, these things will be possible, the publication asserts.

However, it points out that there will remain between two and three million small farms with only a few head of livestock. On these farms, electrically operated water pumps will eliminate a lot of hand-labor in watering livestock, but hand milking will continue on most farms that have only nine cows or less.

Pointing to the future, the publication says that the next generation may see the successful development of the mechanical cotton picker and its widespread adoption in some cotton areas. The effects of such development on farm workers and on the pattern of southern agriculture during the next 30 years may be enormous.

The study concludes that future farm mechanization in the United States will mean that fewer people will be needed for farm work. But of equal importance is the possibility that mechanization will reduce the need for overworking during rush seasons and for the employment of women and children in the fields.

County-wide Meeting

(Continued from page 1)

His talk was very inspirational and interesting.

Remarks were also made by Mr. J. A. Marsh, County Agent, Mr.. J. D. Windom, Veteran Instructor, and Mrs. B. B. Forte, Negro Home Demonstration Agent

The County-Wide Hybrid Corn Production Contest and the State-Wide Soybean and Hybrid Corn Contests were announced. Eaeh leader present was asked to go back in his community and put the things in practice that were brought out in the meeting and to inform their neighbors of the same.

S. T. Lloyd
Negro County Agent

Three Acre Farmer Makes Good Living

Although the national trend is toward larger and fewer farms, the North Carolina State Extension Service reports that there is at least one farmer in that State who is making a good living off as little as three acres.

That farmer is Ira W. Hawkins, who planted one acre to turnip greens last year and used the rest of his three acres for raising chickens and growing a garden. He grossed $800 off his turnips and nearly $1.000 off eggs. This year he plans to increase his income from eggs. Already, his egg production has increased from 12 dozen to 23 dozen per day. His laying flock now number 400, and Farmer Hawkins has recently purchased 900 baby chicks.

Family Admires Coveted Award

T. M. Campbell, Extension Service field agent, his wife, and two of their daughters admire the Superior Service Award he has just received from Secretary of Agriculture Clinton P. Anderson for outstanding agricultural extension work.

Left to right are: Miss Rose Elizabeth Campbell, Mr. Campbell, Mrs. Campbell, and Mrs. Emily Virginia Hawkins. The award was presented last week on the Washington Monument grounds during the Department of Agriculture's first Annual Honor Awards Ceremony.

Only One-Third of

(Continued from page 1)

percent of the Negro farm families studied in the Georgia county had diets that could be considered adequate even when the standard was lowered to 67 percent of the recommended allowance of the National Research Council.

More than half the diets of the families were deficient in vitamin A; about a fourth were inadequate in calcium, and close to one-fifth were short on riboflavin, say. officials of the Rureau of Human Nutrition and Home Economies which conduеted the survey.

Lack of gardens with green and yellow vegetables, and a cow to supply milk and butter largely accounted for the dictary shortages of vitamin A and calcium, the bureau points out.

When the diets of colored farmers in the county were compared with those of whites on the basis of the amount of calcium in their meals, it was shown that white owners and renters ate diets that were 90 pereent satisfactory, while Negro owners and renters ate meals that were only 82 percent adequate.

A comparison of the diets of white and eolored sharecroppers and farm laborers showed an even greater disparity. The former ate meals that were 77 percent satisfactory in calcium, while the latter lived on diets that were only 65 percent satisfactory.

Just a pint of milk a day, an egg, and few garden vegetables for each member of the families that were deficient in calcium and vitamins would have improved their lot considerably, say Department officials. Continuing, they point out that this emphasizes the need for meeting this year's goal of 20 million Freedom Gardens to help satisfy our own nutrition requirements and those of our neighbors overseas.

A key to better diest for farm people, say Department officials, is more satisfaetory tenure arrangements for tenants and croopers. They point out that a lift toward ownership or longer term written leases with provisions for a garden plot and pasture for a cow would go a long way toward encouraging landless farmers to produce more of their own food at home.

Negro Farm Leaders

(Continued from page 1)

pastures and terracing. Other needs named by the group were farm equipment, marketing, refrigeration, painting and water supply.

Those present were: Tannie Holden, Mrs. Bessie Leathers, Willie Chavis and Marvin Chavis, Route 6, Raleigh; R. J. Thompson, Maggie Scott and Montee Scott, Route 1, Apex; Carlee Richardson, Wallace Richardson and Lattie Scott, Route 2, Apex; Bartel Lane and Mrs. Odessa Lane, Route 2, Raleigh; J. W. Burroughs, Mrs. Zettie Mayo, and Mrs. Nathaniel Mayo, Route 1, Morrisville; J. E. Perry, Rody Perry, Theron Perry and W. L. Crews, Eagle Rock; Mrs. Dorthy Alston, Mark Dunn, and Corenna Dunn, Route 1, Raleigh; R. B. Raiford, Route 5, Raleigh; Hunter Bullock, Fuquay Springs; and Mrs. Dasie Hallerston, Route 1, Holly Springs; and Rev. M. W. Williams, Raleigh.

Also assisting with the meeting was E. E. Evans Assistant Negro County Agent, and Natalie Peebles, Assistant Negro Home Agent.

35,000 Purebred Animals Imported by U. S. in 1947

During 1947, the U. S. Department of Agriculture imported 35,229 purebred domestic animals for breeding purposes. This number represents an increase of 2,823 over the number imported in 1946 which topped all preceding yearly importations of purebred stock.

Among last years' importations were: 27,624 cattle, 4,246 sheep, 2,199 swine, 895 dogs, 258 horses, and seven cats.

4-H'ers Start Thrift Club

Members of two 4-H club organizations in Virginia have started thrift clubs in order to save money for next year's project. Under the plan, each member who joins the club must deposit at least one dollar in the bank and have a bank-book. A prize will be given to the member who saves the largest amount.

Presentation Was

(Continued from page 1)

Mr. Campbell went to work as a farm demonstration leader in Ala. He was employed jointly by Tuskegee Institute and the Department of Agriculture. After a few weeks of making preliminary contacts among the farm people who lived in Macon County where Tuskegee is situated, Campbell, then a youth of 23, climbed aboard Jesup Wagon—a school on wheels disigned by Dr. George Washington Carver. He tightened the reins of his sturdy mules, waved goodbye to Booker T. Washington and Dr. Carver and drove off to carry agricultural education right up to the doors of Alabama farm people. His program consisted of distributing improved seed and conducting demonstrations in better farming practices and in improved homemaking.

Campbell has written a book in which he relates some of his experiences during the early days of the Jesup Wagon. The book is entitled "The Movable School Goes to the Negro Farmer." A London edition of this book was published in October of this year.

Among other things, Campbell pointed out in his book that he had to make many adjustments in his demonstration approach. For example, he says he set out to show farmers how to operate a mechanical cream seperator and how to test milk for its butterfat content, but discovered the first day that most of the farmers did not have any milk to test, because they didn't have any cows. So, he shifted his enphasis to pasture development and to ownership of cows as part of a sound live-at-home program.

That was the beginning of extension work with colored farmers. Eight years later the Smith-Lever Act went into effect and the Federal-State Cooperative extension program was launched. Today, about 800 trained farm and home demonstration agents are employed by Extension Service in the Southern States.

Campbell now serves as a regional field agent. He helps supervise and coordinate the work of colored agents in seven States: Florida, Ga., Ala., Texas, Miss., Louisiana and Oklahoma.

Two years ago he was loaned to the General Education to help make a study of West Africa and the adaptability of extension methods as a mass education teehnique in that region. As a result of this study, extension programs are being inaugurated in West Africa as a means of helping the people increase their produetion of food and raise their standard of living.

College Drafts Farm Lease for Landlords and Tenants

A lease-form to serve as a guide for landlords and tenants in drawing up farm renting arrangements has been prepared by the farm economics department of the University of Kentucky, according to reports reported by the U. S. Department of Agriculture from Kentucky State Extension Service.

State Extension officials say that in general, the new lease-form follows local customs already well established. The emphasis is on good farm praetices.

An airman had to parachute to safety owing to engine trouble. On the way down through spaee he met an old lady floating up. "Have you noticed a Spitfire going down?" he shouted.

" No," yelled the old lady. "Have you seen a gas stove going up?"

To Broadcast Ham and Egg Show on Nation-Wide Network

The Georgia Ham and Egg show was broadcasted over the ABC network Saturday March 13, 12:30 p. m. EST, according to report received by the U. S. Department of Agriculture from the Georgia State Extension Service.

The outstanding feature of the broadcast, which will originate in the auditorium of Fort Valley State college, will be an interview of Otis S. O'Neal, colored county agent who originated the idea of holding ham and egg exhibits at the school 33 years ago. This year, under the direetion of Mr. O'Neal, conuunty ham and egg shows were held all over the State.

Highlight of the three-day show at Fort Valley was an address by Gov. M. E. Thompson on Friday, March 12. Other speakers who apeared on the program are Dr. C. V. Troup, president of the college, Walter S. Brown, director of Extension Service of the State and P. H. Stone, colored State supervisor of extension work.

The Ham and Egg show was started by Mr. O'Neal as a means of stimulating more of the farmers in his county to raise and cure more of their own supply at home. Most studies show that while the colored farmers of Georgia eat diets that are deficient in vitamins and some nutrients, their consumption of animal protein is relatively high.

Eggplants Gaining Steadily As Popular Garden Staple

By Dr. Floyd Brailliar

Eggplants are of tropical origin and like peppers, tend to be perennial where there is not enough cold to kill the plants.

They are steadily growing in popularity and always command high prices. Nevertheless they are easy to grow, if given proper soil and care.

The fruits must commonly resemble goose eggs in shape, hence the name. There are varieties whose fruits are long and cylindrical, as, for example, the cowhorn varieties. Some varieties bear glossy white fruits. some bear striped fruits, and occasionally we see a variety of flame orange color. But the most common color is deep purple In fact, in recent years the purple varieties have almost captured the market.

Edible at All Times

The fruits are edible at any and all stages from the time they are the size of a hen's egg until they are fully grown, and the seeds have fully ripened. The quality is best just before the fruit is fully grown, for then the seeds are small and tender and are not noticed. Such fruits in this condition may be recognized by their glossy velvety appearance. As they reach the stage of ripe seeds, they become dull in color.

In Middle Tennessee, one should be able to grow an average of five or six eggs to the plant. The fruits should be picked as fast as they are old enough to use economically. If allowed to ripen seeds they will stop setting more fruit; but if kept picked, they will continue to bear until killed by frost. Eggplants may be kept in good edible condition for at least six weeks after they are picked if stored in a cool moist location. They keep better when wrapped in paper.

Because they are strietly hot weather plants, we do not recommend setting eggplants in the open ground before May 1. The seeds are slow in germinating and require from six to eight weeks to grow plants large enough to set in the open field. This means that the seeds must be sown in a hot bed or a greenhouse for best results. If the seeds are planted where they are to remain about May 1, they will begin bearing within 10 or 12 days later than plants set out May 1.

For best results, eggplants should be grown in loose soil that is full of humus but only moderately rich. If the soil is too rich, the plant will grow large and soft and will set little or no fruit.

Broccoli Easy To Grow, Should Be in More Gardens

By Dr. Floyd Brallier

Broccoli is another of the vegetables that is not commonly grown in Southern gardens, yet it deserves to be grown widely.

It is a most easily grown and deliciously flavored vegetable for home use and sells very readily on the market, bringing good prices. For those who have deep freezing units, it keeps very nicely and preserves its flavor and its quality almost perfectly.

There are two rather distinct types of broccoli, one being a cool weather crop that resembles cauliflower so closely that only experts can tell the difference. It is much more hardy than cauliflower and is more easy to grow. As a matter of fact, most of the cauliflower we buy in the winter times is not cauliflower at all, but this white-headed broccoli.

But it is not of this type of broccoli that we are writing today. It is of the Italian Green Sprouting type.

This type will grow readily and produce heads, not only during cool weather, but also during hottest weather as well.

The heads resemble those of cauliflower in size, shape, and formation, but they are a deep brilliant green in color.

For best results plant the seed in drills at the same time you plant radish seeds. Like all other members of the cabbage family, the seeds will come up in five or six days and as soon as they are well enough established, be sure the plant is healthy, then thin them to stand 18 inches apart in the row. They should have good rich, moist soil and clean cultivation.

For the earliest crop many sow their seeds in an early hot bed. Set the plants out about the middle of April.

The plants are tall, erect, and vigorous, growing to a. heigh of from two to two and one-half feet. If the ground is very rich and loose, it sometimes pays to stake each plant, though this is usually not necessary.

The first head comes from the top of the plant, and is the largest one that the plant will produce. It should be cut as soon as it is mature, for if left a few days it will burst into bloom and be valueless for cooking.

When this top head is cut, the plant will then throw out branches from the base of the leaves, and each one of these branches will in time produce a good sized head. This means that the plant becomes almost overbearing, producing heads from early summer to late fall.

Broccoli is used in any way that cauliflower is used and is decidedly superior to it in vitamin content mineral content, and most people think in flavor, as well. The seeds can now be had from any seed store.

More Sericea

Hill land which does not grow white clover and Dallis grass or other good permanent pasture plants will produce far more grazing if sericea is properly established, maintained, and managed on them. From Auburn south, March is about the latest time to plant sericea on land which has been well prepared and fertilized.

Kudzu

Kudzu grows on crop land or rough, hilly, gullied land not suited to other crops. On this kind of land it produces good feed and adds to the farm ineome. Setting of crowns should be finished by the middle of March, or before aetive growth starts. Some kudzu seed may be available. If seed can be obtained, plant them in a nursery bed to have plants to set a year from now.

More Oil Is Coming

Just what is responsible for tightness in the oil supply situation in certain areas? Secretary of the Interior Krug recently answered that officially.

"Shortages," he said ,"are not due to decreased supplies, they are caused by tremendous increases in demand. Demand during 1947 resulted in an increase of 33 per cent in the consumption of petroleum products and in a 60 per cent increase in gas consumption. We are using more petroleum products today than during the war peak and more than the entire world used before war.

"More than 90 per cent of the locomotives on order are Diesel engines. domestic oil burner sales are at the highest rate in the history of the industry, fewer automobiles are burning more gasoline than before the war . . . and a developing passenger and freight traffic in the air is requiring larger volumes of high octane gasoline.

"The petroleum industry is trying to meet the enlarged demands but expansion of plants and facilities has been retarded by six years of war and shortages. . . . Daily output of crude oil in the U. S. is now more than 500,000 barrels per day higher than last year's average."

There, in capsule form, is the oil story. No one could have anticipated the extent of the increase in demand since V-J day. and the industry has done a remarkable job in dealing with it. Serious shortages have been rare, and if the public cooperates in reasonable conservation measures the situation will ease. More oil is coming as fast as it can be produced.

The Tap Root of Freedom

There is only one basic difference between the American system of government and the governments of those countries suffering from varying degrees of dictatorship. That difference is the right, protected by law, of private ownership of property. Private property is the tap root of freedom.

It is impossible to abolish private ownership of property for some without ultimately destroying it for all. And once it has been destroyed, a central government becomes boss for the simple reason that it is the sole employer and sole property owner.

Oppression follows automatically when a people, stripped of property, must rely blindly on a government run with a free rein by men who need no longer recognize anti-trust laws. labor unions, or anything else—men who can abandon the constitutional trappings of a free country because they are bigger than the law by right of might.

Total control is always the dream of ruthless men. The ultimate in total control is total government. The one thing standing in the path of total government in the United States is the private owenership of property vested in milions of American citizens. It must ever remain so.

Produce Seed

In eases where it is practical, produce seed for crops grown on your farm. A big increase should be made in the production of sericea and annual lespedeza seed, white Dutch clover, and other feed and pasture crops. By all means leave some areas in blue lupine, Caley peas, veteh, crimson elover and burr clover for seed production.

Fertilize Trees

Fertilize fruit anl nut trees with a complette fertilizer before growth begins. If cover crops are on the ground, delay this to give them all the time possible to grow.

"You ought to be ashamed of yourself," the father told his lazy son. "When Washington was your age he had become a surveyor, and was hard at work."

"Yeah," retorted the son, "and when he was your age he was President."

The 1948 Farm Price Outlook

We don't know of anything farmers are more interested in than the prices they are likely to receive for their production in 1948. I don't know anyone who would dare say what prices will be after what has happened in the grain and stock markets during February 2-7.

Already there are many reasons given for the decline in the price of grain at the principal grain market of the world, Chicago. It is not worthwhile to repeat them here or to advance others. What matters from a consumer's point of view, is that there are lower prices. Prices have to come back to normal sooner or later. It is said, "the higher prices go the further they will fall." How low they will fall is the thing that counts, from the farmer's point of view.

FARMERS WON'T SUFFER FROM LOW PRICES AS THEY DID IN 1932

Whatever happens, farmers are not likely to suffer from low prices as they did in 1932. Thanks need to go largely to the American Farm Bureau for price supports now in force for major farm commodities. Added to this, the national farm mortgage debt is much less now than it was in 1932. Then, too, there are federal credit facilities now in use, and which farmers know how to use. that did not exist in 1932. Finally, should export trade decline, it will take many months' production to supply consumer deman here in the United States. All of these make for full employment, fair prices, and a healthy economy.

With Lower Prices Efficient Production Is Necessary

If prices do drop to a healthy level for both consumer and producer, farmers will need to produce at lower costs in order to get a fair profit. Lowering the costs of production in 1948 will tax the wisdo mof best farmers because: 1) the cost of things used in production will not drop before the crops are planted and harvested, and 2) farmers still sell at wholesale prices and buy at retail priees.

Need to Pick Out Things That Make For Efficiency

To lower the cost of production, farmers will need to figure the things that will help them produce more efficiently. 1) On most farms in Alabama labor is still the highest item of cost. Labor-saving machinery should be used wherever it can be purchased. 2) Thorough preparation of soil for cotton, treatment of seed, use of proper amounts and kinds of fertilizer where no soil building crop is turned, and planting early on the best cotton land will increase yields. 3) Quality staple cotton ginned by ginners who have long staple gin equipment will bring a higher price on the market.

Farmers having income from peanuts or peanuts and hogs will need to follow the recommendations of their agents to get the most efficient production. For farmers having income from dairy and beef cattle, no feed is as cheap and yet as valuable as pasture. Dairymen will find they can milk 6 to 10 cows just about as quickly as 4 or 6 and double income at the same time. Finally, land must be built up and maintained to get continued high yields and make profits in years when prices are lowest.

Four Gardening Weaknesses

The four main weaknesses in gardening in Alabama are (1) failure to use enough fertilizer, (2) not making enough plantings during the year, (3) Waiting too late to make the early spring and early fall plantings, and (4) not enough attention to control of pests.

Save Those Pigs

When a newborn pig dies, 100 pounds feed are wasted. Save the pigs and save feed! The average number of pigs saved per litter in Alabama is 6. Saving an average of 1 extra pig per litter this spring would mean thousands of extra dollars in Alabama farm pockets.

Young Progressives In Washington Make Boy, 17, Treasurer

Seattle, Washington—G. A. Felton Brimmer, University of Washington journalism student, was elected state treasurer of the Washington State Young Progressives last April 17. when a state-wide conference was held at Eagleson Hall, adjoining the campus of the University of Washington.

The Washington State Young Progressives is a youth organization subscribing to the policies of the New Progressive party which was organized in Seattle, April 18. The Washington State Young Progressives and the Progressive Party endorsed the candidacy of Henry A. Wallace and Senator Glenn Taylor for President and Vice-President, respectively, of the United States on the Third Party ticket.

Other officers elected to head the state organization were: Lyle Mercer, University of Washington political science student; President Bert Pelto, an economics major at Washington State College, Vice-President and Lonnie Nelson, Lincoln High School student in Seattle.

Parents Don't Tell All; That's Why Junior's Delinquent

Syracuse, N. Y.—(G)— The theory that may be 90 per cent of juvenile delinquency could be eliminated if adults were not so scared to talk frankly to junior and sister, was expressed by the Rev. Charles C. Noble, dean of Hendricks Memorial Chapel, Syracuse University, at the forty-second annual convention of the Boys' Clubs of America.

Dean Noble minced no words when he said that most of the youngsters get into trouble through ignorance, which should be dispelled tactfully by Boys' Club Workers. The Clubs, he said, also, could give assistance to boys in determining their life work.

Nation Applauds Court For Killing Restrictive Pacts

New York— (C)— The ruling of the Supreme Court, forbidding use of the courts to enforce racially restrictive real estate covenants, was hailed as a victory over Jim Crow by Negro and Jewish organizations, and church and labor groups

The decision was described by the National Association for the Advancement of Colored People as justification of its thirty-one-year fight to outlaw discrimination in housing. Thurgood Marshall. special counsel to the N. A. A. C. P., said that it gave thousands of prospective home buyers throughout the nation, new courage and hope in the Ameriean form of government.

Joseph M. Proskauer, president of the American Jewish Committee, called the ruling another milestone in the democratic effort to eliminate discrimination in the enjoyment of basic civil and politieal rights by all groups, regardless of race, eolor, religion or national origin.

Pruning

Complete the job of pruning the orchard. All broken or diseased wood should be removed first. Cut the remaining limbs so as to get the shape desired for each fruit. Remove the prunings from the orchard and burn them

PRUNE TREES

Nice days in February are a good time to prune fruit trees.

U. S. May Increase Wheat for Europe 50 Million Bushels

By the World Staff of the AP

Washington—Look for the cabinet food committee to decide about April 1 that this country can spare an extra 50,000.000 bushels of wheat for Europe this spring.

The grain export program for the crop year ending June 30 now is 520,000,000 bushels. This includes 450,000,000 wheat and 70,000,000 other grains.

The Committee—Secretary of Agriculture Clinton Anderson, Secretary of State George Marshall, Secretary of Commerce Averell Harriman—plans to review the grain supply situation at the end of this month.

It must hold back 150,000,000 bushels of last year's wheat for a year-end reserve for this country. But it is expected to find that such a reserve can be maintained and upwards of 50,000,000 bushels of extra wheat spared for export.

Shipments of extra grain to Europe this spring, officials say, would be a good counter weapon against Communist efforts to win control over western European countries.

The Basic Problem

Steel has been in the headlines again, due to recent increases in the wholsale price of some steel products. There has been a great deal of conflicting testimony as to how much this will increase the industry's income, and to just what extent it may become reflected in the price of commodities at retail.

These statistical debates are inevitable. But they should not be permitted to becloud the big and basic problem—what is the best and surest way to produce sufficient steel of all kinds for present and future needs?

The computations of steel's earnings are largely based upon the cost of plants which were built many years ago. These plants are having to be gradually replaced, and new plants are being built. The cost of construction today is far above that of the prewar years. Obviously, if steel cannot earn sufficient set profits to meet the inflated costs, it cannot carry on an adequate replacement and expansion program.

The steel industry is spending great sums for new and improved facilities now. Its extension plans will be gradually enlarged. It is actively fighting the gray market, and it is doing everything it can to get steel out and to allocate it fairly. These are facts that must not be forgotten in the perennial squabbles over how much steel should cost.

No one knows how far and how fast the demand for steel will go. But our dependence on steel in both agriculture and industry is evident at a glance. It is the basic industry on which all other industries depend. We want to buy our steel as cheaply as possible, but it would do no one any good if the price were so low as to make prolonged steel shortages a certainty.

The steel industry is spending great sums for new and improved facilities now. Its expansion plans will be gradually enlarged. It is actively fighting the gray market, and it is doing everything it can to get steel out and to allocate it fairly. These are facts that must not be forgotten in the perennial squabbles over how much steel should cost.

Terraces Built Rapidly With Slip Scrape

With a shortage of tractors and machinery for building terraces two groups of veterans have been shown how slip scrapes can be used for this important work.

The first job was done on the farm of Morrell Jackson, Pleasant Hill Community. Elmore, County, as during this demonstration 156 feet of terrace was built with one slip scrape within one hour. The next day Jackson alone completed 400 feet using the scrape with one horse.

Another demonstration was given on the farm of Robert Paschal, Mt. Zion Community. During this demonstration 200 feet of terrace was built within one hour. It is estimated that these young farmers will complete all terrace work on their farms in a week's time.

Others taking part in these demonstrations plan to do similar work on their farms.

Poor Land Instead of Faulty Politics World's Trouble, Conservationist Says

By Joe King

New York—(AP)—Poor land instead of poor politics is seen by Fairfield Osborn as the basic cause of the world crisis.

"When will people realize," said he during an interview, and between habitual smiles, "that one of the chief reasons for international friction is eroded lands and increasoing population?"

A tall, friendly, professional type, Fairfield Osborne is famed as a conservationist and president of the New York Zoological society which runs the world-renowned Bronx zoo.

Leaning back in his office chair at the 38-story level above what passes for good earth in Manhattan. Osborn discussed the world situation. What really counts, in his view, is well cared-for farms.

Book Furthers Crusade

To Osborn, this is a crusade. Furthering it, he has just written, "Our Plundered Planet,' to be published Thursday on what erosion has done to the earth and the men who live on it. For the first time he sets down together the stories of the world's dwindling backlog of good land and its headlong population increase.

If the real crisis, which underlies all others, is not met, he says, freedom from want will ever be a dream.

Osborn figures that the world's two billion people have available only two acres of land apiece although they need two and a half Many a nation has less than an acre of land per capita.

"No wonder there are shortages,' he said.

"But that's not all. People go on increasing. There'll be three billion of us in less than a hundred years at this rate. And the land will be still sicker, unless we get busy."

Long Way to God

America has made a start on doing something, but Osborn regards at as only a start. Most of Europe learned how to treat farms well long ago. But many regions around the Mediterranean that now pass for deserts were forested and fertile before man got in his dirty work.

Man has become says Osborn, a major geologic force. He cuts down the forests, and torrents tear away the topsoil. Yet Japan's 70 million people showed how a rocky homeland only the size of Montana could be made to blossom. There are other such spots, of course, but in the main the record has been one long catalogue of destruction and mining the land.

Wildlife Destruction

The record includes the wholesale destruction of wildlife.

Give Osborn time and he will go right down the list of continents and nations and put a finger on waste and destruction in each. Misused land not only produces less, but it produces food that fills without sustaining, that lacks essential minerals.

Something really can be done about all this. Men know how, says Osborn, to stop erosion and build up the land. It's a matter of education, organization, capital expenditure and public opinion.

But how about population increase?

That's something for which Osborn has no solution.

"Things will have to level off eventually," he concludes.

Three Fruit Crops Soar To 11-Year High in Tennessee

The production of three of Tennessee's leading fruits reached an 11-year high this past season, the State Department of Agriculture reported today.

In 1947, peaches, grapes and commercial apples set the record. Last year the production of commercial apples in Tennessee totaled 396,000 bushels, while there were 337,000 bushels in 1936.

The peach crop for the year totaled 1,209,000 bushels as compared with 540,000 bushels in 1936. In the United States as a whole, it was revealed in a report released by O. E. Van Cleave, state agriculture commissioner, peach production was 82,981,000 bushels.

The 1947 crop of pears in the state totaled 183,000 bushels which, by the way, was an increase over last year's production of 120.000 bushels, and a decrease over the 1936 to 1945 average of 230,000 bushels, it was reported. This was the only principal fruit not to set the record.

Grapes, used principally for wine and preserves, totaled 2,400 tons last year, as compared with 2,100 tons in 1946. The 1936 to 1945 average was 2,220 tons.

More Than Crutch Needed

When bad weather damages a food crop, the farmer is the first to feel the impact but he is not the last one to be affected.

The consumer is soon hit by the effect of crop damage. A short corn crop means higher corn prices which in turn increase the cost of feed for beef, poultry, and other meat animals. As a result of the shortage in the 1947 corn crop unfavorable wheat pasture conditions, R. J Eggert of the American Meat Institute points to a 17 per cent cut in the number of cattle moving into the corn belt compared to a year ago, as a leading factor affecting meat prices.

In a business as highly competitive as food production, price rises are not caused by arbitrary price boosting. Because of a record demand for meat and a scarcity of feed, the total national herd has been reduced by between 3,000,000 to 4,000,000 herd according to the American National Livestock Association. Such a reduction in the national herd, at a time when demand for beef is breaking all records, offers little encouragement for reduced prices in the near future Even with cattle production on the increase, price relief would be doubtful with our present 50-cent dollar

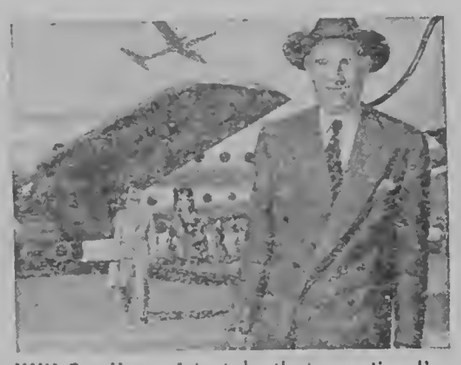
Price control as a remedy is not the answer. It would not bring more favorable weather to grow more corn to fatten more cattle. Neither would it strike at the causes of our present inflation which advances all prices. It is like offering a crutch to a man with a broken leg, instead of setting the leg.

Imagine me growing dollars!

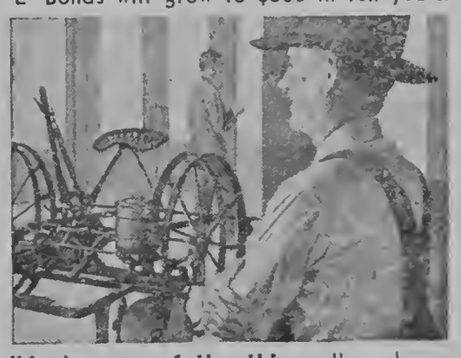
EVERY 3 DOLLARS I INVEST IN U. S. SAVINGS BONDS GROWS TO 4!

... and here's what that will mean to me in '58

"Little Ed's set on playing ball at college and I'm growing the dollars to pay the bill. Every $375 I put in U. S. Security 'E' Bonds will grow to $500 in ten years.



"I'll finally get to take that vacation I've always dreamed of. Ann and I will fly clear down to Buenos Aires. Those Security Bonds will sure make 1958 a big year for me!"



"And some of the things I've always wanted and Mom's modern kitchen will start arriving when those savings bonds start paying off. Best of all . . .

AMERICA'S SECURITY IS YOUR SECURITY

Make the Farms Hum

By Grace Armstrong Allen

Recently we went through our small apiary, hive by hive. It was not really necessary, for we were pretty sure everything was all right But bees are hard to resist after a long beeless winter. Beautiful spring days are hard to resist, too; and after driving away the clouds, the sun had broken out that day thru symphony of bird song to a green and yellow world.

What was still more exciting were the humming bees flashing back and forth to maples and elms, redbud and pear bloom and wild plum. Spectacular as always were the skillful landings of those bringing home big balls of yellow pollen on their legs.

Beginners ask what to look for in this first examination of spring. Stores and brood; also general conditions. Brood means all stages: eggs, open, and sealed. If you have eggs and young brood, you have a queen even though you don't see her. We saw tbout half of ours, without really searching for them.

Our colonies avraged about seven combs of brood, counting both full-depth and shallow. In some cases the queen had been laying only in the lower chamber, in others only in the upper, while still others there was brood both above and below. That gives an idea of about how things look in the hive at this time, though the brood should increase rapidly now.

The honey, judging by rather casual estimates, ran from a scant 15 pounds to a generous 40; that is from a little too little to more than enough, obviously easy to remedy. The probable 27-pound average is very satisfactory. It is commonly believed that nearly a comb of honey is required to develop a full comb of brood. So you can see why it is necessary to avoid running low at this time, when brood-rearing is our chief concern.

Getting the peak of warking population ready for the peak of the main flow isn't always easy. Too often bees "build up" on the main flow instead of for it, that is, instead of being ready to rush it in when it comes. At other times, some colonies will reach their peak too early, and swarm just as the main flow starts.

All reading beekeepers know that there is a fairly wide use of pollen substitutes and supplements, and beginners wonder what they should do about it. We ourselves don't do anything. Trees are the chief source of spring pollen. (Did I hear a growl from a dandelion? Yes, they too give plenty of pollen, but don't come in quantity till after the trees, which are in spite of our vigorous small yellow friends, our chief spring source of pollen.)

Some parts of the United States are practically treeless, and in such places a good pollen substitute is important because pollen is essential for brood-rearing. Where there is some early pollen, but not enough a supplement is needed. Most supply houses carry it. Soy flour and yeast are important ingredients

In most parts of Middle Tennessee, however, there are enough trees to provide all the pollen the bees need. Indeed, many a beekeeper has felt pretty resentful upon discovering comb after comb heavy with pollen where he had honey for himself.

Some of us feel that there is some danger that this extra supply of pollen may stimulate a spurt of expanded brood-rearing, with the result of early swarming. Yet the extra stimulation might be just the right boost.

We saw our first 1948 drone Wednesday. Somehow he surprised me. It seemed early; perhaps not. "You re not welcome," I told him impolitely. But he buzzed back impudently that he didn't care; he was hungry, and ready to eat. Let the girls do the work.

The farmer who has all his farm machinery in good operating condition is several days ahead of the man who waits until the day the machinery is needed to check on it.

Success Record with Burr Clover

"Joseph Heard, a young farmer of Randolph County, Alabama, made a good start with his manganese burr clover in 1947," states County Agent Theodore Shumpert. He fallowed one half acre of land in the spring and summer of 1946 for fall planting of his clover. Approximately four tons of barnyard manure was used along with the recommended commercial fertilizer on the half-acre about thirty days before he planted his clover.

Heard planted 50 pounds of seed on October 17, 1946. The clover came up to a perfect stand. In June this year he harvested 200 pounds of seed from the half-acre. He sold $50 worth of seed and yet had some left to plant an additional half acre.

After harvest he planted grain sorghum on this same half acre. It produced an unusually good crop. It is estimated that the feed value would be equal to 50 bushels of corn.

New Style Railroading

What the railroads are doing to improve passenger service is well described in a statement by William T. Farley, president of the Association of American Railroads, which appeared in Editor and Publisher and is addressed to the press and radio.

Before the war, the railroads were well along in an equipment-improving program which began in the early '30's. Most of the regularly assigned cars in through service had been air-conditioned, and about 150 streamlined trains were in service.

The war brought a dead stop to passenger car building. As soon as it was over, the railroads promptly ordered more than 4,000 modern passenger cars. Only about 1,600 of these, mostly coaches, have been delivered. Yet to be delivered are 1,000 new sleeping cars, principally of the all-room type, and until more of these are built, the demand for reservations in some areas will be greater than the supply.

All in all, the railroads have something like $500,000,000 worth of new passenger train equipment on order. In addition, the lines are continually improving their methods of making reservations and selling tickets for the convenience of the traveler.

In Mr. Farley's words, the railroads "realize that an overwhelming majority of the people judge them by passenger service. And so, while they are hauling more tons of freight more miles than ever before in time of peace, they are at work to see that the passenger shall get the service he wants, and which the railroads want him to have."

COWS PAY GREAT DIVIDEND IN THE BLACK BELT AREA

E. L. Jackson of Uniontown, Alabama, has joined other dairymen in saying that good milk cows will pay a dividend. For 15 or more years he has been growing cotton as a cash crop, and selling a little milk from two or three cows.

He has added to his herd for the past five years until he now has 12 cows in profitable production. He sends more than 40 gallons of milk a day to the cheese plant.

Mr. Jackson says that he will not plant any more cotton on his farm, and has proved it by turning the land into pasture. He has applied 400 pounds of phosphate per acre. During the past year this pasture was mowed twice to keep down weeds. Jackson is proud of this timely switch from cotton to milk. He says it is easier and not nearly as risky.

To polish tile after it has been washed, cover with a thin coating of laundry starch, let dry and then polish with a soft cloth.

Free Enterprise in Hawaii

There is no lack of evidence that the free enterprise system has achieved a higher standard of living for the masses of the people than has any other system. And that evidence isn't found within the continental limits of the United States alone. A fine example of it exists 2,000 miles out in the Pacific —in the Hawaiian Islands.

Hawaii, with a population of 525.000, produces 90 per cent of our pineapple products and one-seventh of our sugar. It is primarily an agricultural region. And it pays the highest farm wages in the world—over $8.00 a day. It maintains a standard of living unparalled on plantations anywhere else.

This wasn't the result of a happy accident of abundant natural resources. The Islands are of volcanic origin, are not very fertile, and present special and difficult development problems. Nor was it the result of an influx of foreign capital—until relatively recently the Islands were not attractive to mainland investors. It was, instead, the result of local free enterprise. Most Hawaiian businesses have been developed by saving and hard work, and by plowing profits back in. The great bulk of them are locally owned.

We've heard a great deal of talk about domination of the Hawaiian economy by a few concerns. Yet there are 1,000 different corporations in the Islands, owned by 35.000 stockholders, and new enterprises are warmly welcomed. Admittedly, many social and economic issues have yet to be solved. But free enterprise in the Islands is doing what it has done on the United States mainland—raising the living standards of the people to the highest known level.

* * *

About the time you're important enough to take two hours for lunch, the doctor limits you to a glass of milk.

A Fair Price

When you walk into a store to buy a dozen eggs, a pair of shoes, some kitchen utensils or any other article, what is a fair price? Is it the price that existed last year? Or is it the price that was in effect in 1940, or 1900, or any other date!

That question is obviously unanswerable. The price of anything is made up of a long list of factors, all of which are in a constant state of flux. Raw materials, wages, taxes, transportation enter into it. So does the extent of consumer purchasing power. So does employe efficiency and output. So does foreign demand for commodities which are in tight supply here. And so, to a very great degree, does the fact that we have a record national debt, after the most destructive war in history, and the government is still spending money at a prodigal rate.

Business, on both the manufacturing and retailing levels, gets much of the blame for high prices. But business is as worried about them as any consumer. Mass production and mass distribution are the backbone of the economy, and if consumers are priced out of the market the ultimate effect will be disastrous. A number of manufacturers have cut prices and absorbed the loss. Retail margins, both independents and chains report, are shrinking fast, and the inventory problem is the cause of much concern and uncertainty among merchants. Everything possible is being done to prevent further price increases, and to effect price decreases when possible.

It should be widely known that retailers' profit margins are now generally less than under OPA. The same thing is true of many manufacturers. The demand for arbitrary, across-the-board price cuts cannot be met. No one knows what the future of prices will be. But, by and large, they will be as low as costs permit.

Winter Legumes

Watch winter legumes and turn them on time. Be sure to let them make enough growth to pay you.

Farmer Makes Pigs Do His Snow Shoveling

It's A NATURAL—snow plow that is.

Did you ever hear of a natural, self propelled snow plow? This is how Jess Work of Dickson makes a road to various buildings on the farm during recent snows.

After shoveling 10-inch deep snow for some time with little progress, Work's attention was attracted by the hungry pigs in the pen.

He turned the pigs out and with a bucket of feed in each hand, he walked from one building to the other and back to the pen. Of course the hungry dogs followed. Results: A well trodden path to all farm buildings.

Seven Burned

A short time ago, in a farm home near Danville, Iowa, a large family was asleep. At about four in the morning a fire of undetermined origin broke out. No fire equipment was available. Three children and the parents escaped. Seven children, who were sleeping in upstairs bedrooms, perished. The flames spread so rapidly that these children could not be reached by the time the others awakened.

What happened near Danville has happened, in lesser or greater degree, in thousands of American communities. At the moment you read this, it is probable that fires which will destroy life are in progress. Today fire may strike a long way off from you. Tomorrow it may come home.

A very large percentage of dwelling fires are the results of dangerous heating equipment, particularly old stoves and open fireplaces. Open flame burners count for an appalling number of deaths by asphyxiation. Then, going down the list, electrical and smoking hazards take their grim toll.

The seven children who were cremated alive near Danville are now statistics—tragic evidence of fire's insatiable appetite. A few weeks ago they were alive and happy. How many more lives will fire destroy in this country before we learn that fire prevention is the duty of every family, every owner of a business, and every worker?

COVER CROPS PAY FARMERS PROFFIT

Farmers in Lawrence County have learned the importance of winter cover crops. Better farm land and increased crop yields have been reported from all parts of the county.

Titus Garth, Courtland community, is one of the farmers that reports an increase in crop yields for this year. His corn yield increased 12 bushels per acre and a cotton yield of more than a bale per acre was made.

"Two years ago I planted vetch for the first time, and I certainly realized a great increase in my crops," Garth stated.

On his 60 acre farm Garth has planted other crops. These crops consist of alfalfa, lespedeza and permanent pasture.

Garth is following the system of farming recommended for this section and plans to go into dairying as a supplement.

CONTROL PARASITES

LICE can be controlled by spraying the animals with DDT or rotenone. Use one pound of 50 per cent wettable DDT in four gallons of water or 8 pounds of 5 per cent rotenone in 100 gallons of water.

GRUBS are controlled by spraying with 8 pounds of 5 per cent rotenone in 100 gallons of water. They can also be killed by rubbing into the hair over the back a dust that contains 1.5 per cent rotenone.

BOTS and WORMS cause workstock to come through the winter in a run-down condition. Treatment for parasites by a competent veterinarian in February will pay big dividends in feed saved with greater efficiency. Bad teeth can be floated at the some time.

Count Basie And Band Scores Big Hit At Carnegie Hall

New York, N. Y.—Count Basie, the "Jump King of Swing," scored the most spectacular triumph of his illustrious carcer as he and his powerhouse musical aggregation made their concert debut at Carnegie Hall, last Saturday midnight, and rocked a screaming, excited audience with more than two hours of pure unadulterated jazz.

The Basie aggregation, described by disc-jockey master of ceremonies Fred Robbins as "the greatest swing band of all time," came up with the most exciting jazz concert ever presented at Carnegie Hall. Although handicapped by the absence of lead altoman Earl Warren, who collapsed during an afternoon rehearsal and was rushed to the hospital with a case of pleurisy, the Basie band and its brilliant soloists rose to the occasion with a superb performance.

Highlights of the concert were the initial presentation of Basie's own "Royal Suite" in six movements, veteran tenorman Buddy Tate's exciting work in "Rockabye Basie," and a 30-minute jam session on the closing "One O'clock Jump," which featured the entire Basie band and guest instrumentalists "Hot Lips" Page, Buck Clayton, Leo Parker, Al Killian, "Taps" Miller and Lucky Thompson.

Buddy Tate was unquestionably the individual star of the concert. A veteran of almost a decade with the Basie band, Buddy set off a near riot as he stepped forth to blow on "Rockabye Basie." Not since Illinois Jacquet's last Carnegie appearance has any soloist so excited an audience. Buddy electrified the crowd with chorus after chorus and finally bowed off to a thunderous ovation.

The concert also included solos by Basie bandsmen Paul Gonzales, Clark Terry, Harry Edison, Emmett Berry, George Matthews and Dickie Wells, while vocal honors went to James Rushing and Bob Bailey.

Jim Crow Will Be Challenged Again In Oklahoma Case

New York, May 13—The fight to gain admission to the law school of the University of Oklahoma for Mrs. Ada Sipuel Fisher will be renewed on Monday (May 24) with the opening of a new trial in the District Court at Norman, Okla.

Thurgood Marshall, special counsel for the National Association for the Advancement of Colored People, and Edward R. Dudley, assistant special counsel, left here Tuesday (May 18) to join with Amos T. Hall, an Oklahoma attorney, in representing Mrs. Fisher in her legal battle to enter the state-supported all-white law school.

The new trial was granted in response to a motion filed on March 11 on behalf of Mrs. Fisher, petitioning the court for further relief against the Board of Regents and other officials of the University of Oklahoma. The request for a new trial followed refusal of the law school to admit Mrs. Fisher after the United States Supreme Court had handed down a decision imposing upon the State of Oklahoma the obligation to provide her with an opportunity for a legal education forthwith.

In an attempt to demonstrate conclusively that there can be **no** equality in segregated facilities, Mr. Marshall will present an array of experts in legal training, anthropology and sociology. Among these will be the deans and other faculty members of some of the leading law schools in the country who are expected to testify that it is impossible to get equal training in a separate law school.

WOMAN'S PAGE

TO THE KING'S TASTE

By Hoyt Alden

Ignore the Little Woman's Example—Don't Drown Vegetables in Water

American cookery, at home and in restaurants, reaches a new low when we consider a vegetable department. As a matter of fact, it is seldom considered at all. The average male will devote himself to a passable meat course and a fair dessert and vote it a good meal, despite the fact that the Little Woman has come up with the usual soggy salad and vegetable dishes that have been drowned in water and cooked until there is not a vestige of taste left therein.

To get at vegetable cookery, we will have to visit some other countries where the art is really understood. For instance, take that little bird's bath full of peas that comes along with many of our dinners. You would never get anything as listless as that if a good French cook were in charge of the dinner. You would get them in this fashion:

Put two pounds of peas in a saucepan with just enough salted water to cover. Put in a half cup of sugar and let the peas cook, covered, quickly until tender. Drain and put back over a low flame to dry out slowly. Put in a tablespoon of finely chopped parsley and an eighth of a pound of butter. Mix thoroughly and you are ready to eat. You would never believe it.

Or: Slice up a head of lettuce and put it in the pot with a small chopped onion and three tablespoons of mint. In goes a pint of peas and just enough water to barely cover the bottom of the pan. Salt and simmer all for 15 minutes. Put in a tablespoon of butter and a teaspoon of sugar and cook until the peas are tender. That's something worth eating.

IN ADDITION to sousing everything in gallons of water and being totally unaware of the meaning of true seasoning, the Little Woman must plead guilty to overlooking completely some of the most edible of all the vegetable family. One of the most overworked phrases in the American household is "My husband and the kids simply will not eat vegetables." No wonder. They probably never get anything but peas, corn and tomatoes. Dishes like stuffed and fried eggplant are virtually unknown on the average American table yet Arnaud's restaurant in New Orleans has made a world-wide reputation for the excellence of its handling of these dishes. Here is how Arnaud's turns out baked eggplant:

Have an eggplant for each person to be served. Cut off enough of the stem end so that it will stand upright. Now cut off the other end and scoop out the center. For each eggplant mince a small onion. Add three-fourths of a cup of chopped tomatoes for each onion. Mix in the chopped up centers. Cook all for a few minutes and thicken the mixture with some cooked spaghetti, macaroni or rice. Stuff the eggplants, cover the tops with bread crumbs, dot with butter and stand upright in a buttered baking pan. Put the plant in a medium oven until the crumbs are brown.

CAULIFLOWER MAKES an occasional appearance on our tables, particularly in restaurants where the proprietor thinks he has more than done his duty if it is boiled in a little salted water and a cream sauce, resembling paperhanger's paste. A more horrible dish was never invented. It would be just as easy to serve it in Hungarian style, after the fashion of real cauliflawer eaters. Like this:

Boil your head of cauliflower in salted water to barely cover, about 15 minutes. While it is cooking, put one and one-fourth cups of milk in a saucepan. Mix four teaspoons of butter with seven teaspoons of flour, remove the milk from the flame and stir the butter and flour into it. Get it smooth.

Return to the fire and add a heaping tablespoon of grated Parmesan cheese, two tablespoons of lemon juice and a shaking of salt to taste. Cook until fairly thick. Now beat the yolk of an egg in a cup and gradually add some of the salted water to barely cover about sauce until it is well mixed. Pour the works into the sauce. Stir. Drain the cauliflower, divide and place in a buttered baking dish. Cover with the sauce, sprinkle with toasted bread crumbs and more grated cheese. Either dot with butter or pour melted butter over all. Bake in a moderate oven until it is brown. Eat and sneer at the restaurant proprietor the next time you see him.

EVEN THE LOWLY squash is worthy of attention when handled in expert fashion. Having resisted squash for many years with practically no effort, I became a convert when introduced to a South American version. This recipe undoubtedly came from Spain or Italy where they really know how to do squash up brown. It goes like this:

Get young squashes and split down the middle. Scoop out the pulp and mince. Fry a small chopped onion in some butter. Add the squash pulp, a chopped hard cooked egg and one-half a cup of cheese, almost any variety will do. Cook a minute. Remove. Add a raw egg to hold things together and stuff the mixture into the shells. Sprinkle with bread crumbs, dot with butter and bake until brown, basting with cream now and then.

JIFFY-MADE SALAD DRESSING

A small amount of salad dressing may be quickly made if four tablespoons of oil are shaken in a small glass jar with two tablespoons of mild vinegar and one-half teaspoon of salt. The jar should be tightly covered and the ingredients should be extremely well shaken.

REFRIGERATOR ROLLS

2 cups boiling water
½ cup sugar
1 tbsp. sugar
1 tbsp. salt
2 beaten eggs
2 tbsp. shortening
2 cakes yeast
¼ cup lukewarm water
8 cups bread flour (sift before measuring)

Mix boiling water, ½ cup sugar, salt and shortening together and cool to lukewarm. Soften yeast in lukewarm water, add tablespoon of sugar and stir into first mixture. Add beaten eggs and stir in four cups of flour, beat thoroughly. Stir in four more cups of flour and mix thoroughly but do not knead. Cover and put in refrigerator. Shape into clover leaf rolls or any form desired and put into pans to double in bulk about one and a half hours before ready to bake. To make cheese rolls, roll out dough one-half inch thick. Cut in large squares or rectangles, yellow cheese. Roll over in three folds. Brush with melted butter, allow to rise until light and bake 15 to 18 minutes in 400-degree oven.

RANCID LARD

A good method of preventing lard from becoming rancid is to add two to three pounds of vegetable shortening to every 50 pounds of lard at rendering time Add the vegetable shortening to the rendered lard just before removing the cracklings. Home economists suggest that lard be stored in a cool cellar.

PEPPERMINT STICK CANDY ICE CREAM

24 sticks peppermint candy
11 qt. sweet milk
2 egg yolks
1 tbsp. sugar
1 pt. heay cream

Dissolve candy in sweet milk. Beat egg yolks until light, add one tablespoon of sugar, and add to warm milk. Place in double boiler and heat until candy is thoroughly dissolved and mixture slightly thickened. Cool. Add the cream and freeze. If preparing in mechanical refrigerator, the first mixture should be frozen to a mush and then mixed with cream and whipped slightly.

OLD FASHIONED POUND CAKE

2 cups soft butter
2 cups sugar
10 eggs
4 cups cake flour
½ tsp. salt
½ tsp. mace
½ tsp. lemon juice

Cream butter, add sugar gradually and beat well. Add eggs one at a time, beating well after each addition. When the last egg has been added, beat for one minute. Sift and measure flour, add salt and mace. Add flour mixture to creamed mixture carefully. Add lemon juice and mix well. Turn into a well greased tube pan and bake one hour to 75 minutes in 325-degree oven. Or bake in three loaf tins. Cover with a plain icing tinted green.

PLAIN ICING

2½ cups sugar
1 cup water
½ cup light corn syrup
3 egg whites

Combine sugar, syrup and water; stir; cook to 242 degrees, or to very firm ball stage. Pour slowly over stiffly beaten egg whites, beating constantly. Flavor and beat until cool and stiff enough to stand.

NEW ENGLAND CLAM CHOWDER

2 lbs. bacon or salt pork, diced
2 qts. onions, chopped
4 qts. potatoes, chopped
4 qts. water
3 gallons clams, diced or ground
4 tbsp. salt
1 tbsp. pepper
2 gallons milk
1 pint flour
½ lb. butter
Chopped parsley

Fry bacon until crisp and brown. Add onions and cook until tender. Cook potatoes in salted water for 10 minutes. Add the bacon, onions, clams and pepper to potatoes, simmer for 30 minutes. Heat the milk and thicken slightly with flour. Just before serving, add hot milk and butter and simmer three minutes longer. Sprinkle finely chopped parsley on top and serve with crackers. This recipe yields approximately 100 cups of chowder.

A seafood dish upon which an entire meal may be based is scalloped oysters, an old-fashioned supper dish which has never lost its appeal.

FISH CHOWDER

3 slices salt pork
6 small Irish potatoes
4 small onions
2 lbs. fish (cod or haddock)
1 qt. can tomatoes
Salt and pepper

Dice pork and fry crisp and brown. Turn into kettle, add cut up potatoes and two of the onions, chopped fine. Lay fish in kettle and add rest of chopped onion. Season well and pour in just enough water to cover fish. Add the can of tomatoes and cover kettle tightly. Cook until potatoes are done. Add to this two quarts of milk and let chowder scald well again. Serve with tomato catsup, if you desire. Clam and oyster chowder is made in the same way, with oysters and clams added just before serving. Oyster or clam juice is cooked with vegetables. Serves six or eight.

Gumboes belong to the chowder family, too.

As with any other food fish calls for certain accompanying dishes. For instance, a tart salad is a good addi ion to a meal featuring fish chowder. Endive is re-appearing on the market and provides a change from ordinary lettuce. Plan to serve it in the whole head, studded with wedges of tomato and sections of pink-meat grapefruit. Pass a French dressing with this salad. Cornbread goes well with fish, but don't overlook an opportunity to serve a crisp bread with chowder. Bread sticks are today's choice and, if you like, costar them with hot graham biscuit. For dessert I suggest an old favorite, cheese and fruit, which is a good choice when serving buffet-style with the cheese-fruit platter at one end of the table and the casserole of chowder at the other end. Vegetables, such as peas and carrots, buttered asparagus, broccoli or cauliflower, may be added.

SCALLOPED OYSTERS

1 pint oysters
1 cup cream sauce
1 cup bread or cracker crumbs

Wash and drain oysters. Put in greased baking dish one layer of oysters. Spread with sauce. Sprinkle with bread crumbs and another layer of oysters and so on until all is used. Sprinkle the top with crumbs and bits of butter or margarine. Run in oven to cook and brown. Serve hot. Serves six.

OYSTERS IN TOMATO SAUCE

1 pint oysters
½ cup white sauce
1 scant cup tomato juice

Make white sauce. Add tomato juice and season to taste. Add a little minced pepper. Put in baking dish in alternate layers of oysters and tomato sauce, adding a little cracker dust. Run in oven and bake 20 minutes. Serves four to six.

OYSTER LOAF

1 qt. oysters
1 cup cream
Salt, pepper, butter
2 egg youks

Remove top of a loaf of bread, scoop out middle and brush inside with melted butter. Brown in hot oven. Scald oysters in own liquor and drain; add cream to liquor; thicken with egg yolks and season. Put alternate layers of oysters, sauce in loaf, top with bread cdumbs, melted butter. Brown and serve hot, in slices. Serves eight.

BREAD STICKS

1 cup milk
¼ cup lukewarm water
1 cup milk
4 tbsp. shortening
2 tbsp. sugar
½ tsp. salt
1 egg
3¾ cups flour

Dissolve yeast in lukewarm water. Beat egg, add sugar, milk and melted shortening. Combine with yeast. Make into dough with flour which has been sifted with salt. Allow to rise until light. Toss on floured board. Shape into sticks of finger size. Place slightly apart on greased pan and allow to rise about one hour. Place in hot oven (about 400 degrees F.) and in a few minutes reduce to 325 degrees F. Bake until brown and crisp. If you desire, brush sticks with white of egg before baking and sprinkle with caraway or poppy seed or coarse salt.

WHOLE WHEAT BISCUITS

2 cups whole wheat flour
2½ tsp. baking powder
½ tsp. salt
¼ tsp. soda
4 tbsp. shortening
½ to 2-3 cup buttermilk

Sift dry ingredients together. Cut in shortening with fork. Add buttermilk. Bake in 475 degree oven 10 to 15 minutes. Yields 15 two-inch biscuits.

It's not much of a trick to expand a recipe for chowder for service at church or lodge suppers—and my mail has been full, recently, of requests that I suggest a dish for just such occasions.

CARAMEL ICE CREAM

1 pt. milk
¾ cup sugar caramelized
1 qt. cream
1 cup sugar
1 tbsp. cornstarch
½ tsp. vanilla
1 egg

Make custard of sugar, cornstarch, milk and egg. While both are hot, combine caramelized sugar. When cold, add cream and flavoring, mix well and freeze.

CARAMEL NUT ICE CEAM

Follow directions for Caramel Ice Cream recipe, adding one cup of chopped nuts Blanched almonds browned in caramel sugar and ground are nice to use in this recipe.

Equally good, and perhaps more economical would be the combination of peaches with a simple cake and sauce, both served warm. Or there is that ever-present standby, cold cake served with chilled peaches and topped with whipped cream.

PEACH COTTAGE PUDDING

1⅛ sups sifted cake flour
2 tsps. baking powder
½ tsp. salt
¾ cup sugar
¼ cup shortening
1 egg, unbeaten
½ cup milk
1 tsp. vanilla

Sift together flour, baking powder, salt and sugar. Add shortening, egg, milk and vanilla. Beat for three minutes until batter is well-blended and glossy. (If electric mixer is used beat at a low to medium speed for same period of time.) Pour into lightly greased pan and bake in moderately hot oven (350 degrees F) for 35 or 40 minutes. Serve warm with Spicy Peach Sauce.

SPICY PEACH SAUCE

2 tbsps. cornstarch
1 1-3 cups peach syrup, drained from peaches
1-3 cup water
¼ tsp. cinnamon
⅛ tsp. cloves
⅛ tsp. nutmeg
2 tbsps. butter
1 tbsp. lemon juice
2 cups peach slices drained

Blend together cornstarch and peach syrup, drained from peaches. Add water, cinnamon, cloves and nutmeg; cook until thick. Add butter, lemon juice and drained peach slices or halves Serve warm on warm cake.

HINT TO MOTHERS

In feeding a baby it is better to stand alongside rather than in front of him. Then the baby will probably take his mother's hand and actually help feed himself. If the motion with the spoon is toward himself, he gets the idea of how to use a spoon much more quickly.

GARNISH FOR SOUP

Slice frankfurters in one-eighth-inch slices. Frizzle them brown and serve on top of green pea soup, bean with bacon, tomato or asparagus soup.

Achievements of Negro Farm Women Exhibited At Convention

Second Spring Show And Sale Held in Memphis, Tennessee Recently, a Success

MEMPHIS, TENN.— Negro 4-H boys and girls have just held their 2nd Spring Show at Memphis, Tenn. Crockett, Dyer, Hardeman, Haywood, Madison, Fayette, Tipton and Shelby Counties were represented, with fat pigs in three classes: Light 180 - 210 pounds, Medium - 211 - 240 pounds, and Heavy 241 - 500 pounds. The ages of these hogs are from 5 1-2 to 10 months old. These youngsters are showing their Dads that feeder hogs must not see their birthday, if they want to make money.

The **Champion** of this show was produced by **G. W. Davis**, of **Hardeman County**, which brought **$1.00**

Bartel Lane Farm Scene Of Many Improvements

Raleigh, N. C.-A result farm and home demonstration meeting recently held on the farm of Mr. and Mrs. Bartel Lane, Route 2, Raleigh, attracted fifty-two farm men and women.

The result demonstrations shown were a one and one half acre of alfalfa, permanent pasture lawn, running water system, toilet, home deep freeze unit, toacco barn stoer, purebred Jersey bull, two acre peach orchard, well terraced farm and general home surroundings.

Mrs. Maude McInnis (white) Home Agent, gave a demonstration in wrapping foods for deep freeze storage. After the meeting Mr. and Mrs. Lane served lunch to the group.

The result meeting was under the direction of W. C. Davenport, Negro County Agent, and Natalie Peebles, Assistant Negro Home Agent, both of the State College Extension Service.

State Potato Crop Faces Slump Due To Rainy Season

Tennessee's potato crop will be substantially reduced this year because of excessive rain during planting season, so say farmers of Franklin County, one of the largest potato producing counties.

"Growing potatoes is a gamble in the first place because we never know what to expect in the way of prices at digging time," one farmer said. "When we add the possibility of reduced yields because of drought and late planting, the crop is too much a risk," he said.

"Farmers who complete planting in March seldom have to worry about dry weather, but if they pass the first weeks of April without planting, their chances for a desirable yield is much less," John Fandrick, one of the larger potato dealers in the county said. He estimated the acreage at 30 to 40 per cent less this year.

Meanwhile, crimson clover and pastures in Franklin County are making unusual growth. Prospects for a desirable seed crop are very favorable.

Negro Older Youths Organize County Council Recently

Raleigh, N. C.— Twenty - six officers representing the Older Youth Clubs of Wake County met in Raleigh recently (April 3) and organized an Older Youth County Council, reports W. C. Davenport, Negro County Agent, and Natalie Peebles, Assistant Negro Home Agent.

Millard Perry, Eagle Rock, and president of the Local Older Youth Club was elected president of the County Organization and Mrs. Gertrude Goodson also of the Eagle Rock Club was elected secretary.

The Council set up nine cooperative objectives to be carried out by their local clubs during the year- March: Rat Eradication on Campaign; April; Clean-Up Campaign; May: Window and Door Screens; June: D. D. T. Spray Campaign July: Paint and Set Up Mail Boxes; September: Proper Steps and

Dr. Roscoe C. Brown Addresses 4-H Achievement Program

Dr. Roscoe C. Brown of the U. S. Public Health Service, and Dr. T. B. Symons, Maryland Director of Extension Service, addressed the farm boys and girls of southern Maryland at their Annual 4-H Achievement program last week at State Teachers College, Bowie, Mr.

Dr. Brown emphasized the necessity of 4-H club youths building and maintaining good health in order to carry out their 4-H farm projects successfully. "Adherence to good health practices will contribute directly to successful and happy rural living—Socially as well as economically," Dr. Brown said.

Dr. Symon pointed out that the end of all 4-H activities and all farm activities is better living. "Health," he said, "holds a number one priority."

Two hundred 4-H club members were in attendance at the Achievement program. They received $187 in prizes for outstanding projects in production, home management, health, and citizenship. Twenty-four 4-H'ers received blue ribbon awards as first place winners.

The farm youths also participated in the program by presenting skits, and by displaying interesting exhibits.

Mrs. Bethune Sees Farm Exhibit

Mrs. Mary McLeod Bethune founder-president of the National Council of Negro Women, is shown looking at a farm exhibit placed on display in the Labor Department auditorium by the U. S. Department of Agriculture during the recent NCNW convention in Washington. Mrs. Edith Shepherd, food economist of the USDA Bureau of Human Nutrition and Home Economics, discusses the exhibit with Mrs. Bethune, who was reared on a farm. Mrs. Shepherd, a Howard graduate, is the first colored food economist to be employed in HNHE. The exhibit is now on display in the administration building of the Department of Agriculture.

Many Prominent Persons Take Part In Work and in Inspection of Products

A pictural exihibit of the achievements of Negro farm women is being displayed in the patio of U. S. Department of Agriculture's administration building.

The exhibit, entitled "Women in Agriculture," was originally displayed at the National Council of Negro Women's 12th annual convention which was held recently in the Labor Department auditorium. At the close of the convention, the exhibit was brought to the Department of Agriculture where visitors and its 10,000 Washington area employees would have an opportunity to see it.

The exhibit consists simply of a display of 21 photographs on three small panels which have been placed on easels. The pictures show colored farm women performing various farm chores: Canning foods, culling laying flocks, tending livestock, packing eggs for shipment, harvesting crops, and receiving awards for outstanding work.

During the NCNW convention, Mrs. Mary McLeod Bethune, who was reared on a farm, took great interest in the exhibit.

One Hundred Thousand More Hired Farm Workers Now Employed in South Than Year Ago

Although farm employment declined seasonally on November 1, about 100,000 more hired workers were employed in the South on that date than were at work a year ago, reports the Bureau of Agricultural Economics of the U. S. Department of Agriculture.

The BAE report shows that 10,938 persons were employed on farms throughout the country on November 1. This number included both family workers and hired hands. Of this total, 5,810,000, or more than half, were working on farms in the

Secretary Anderson Praised Farmers at The Louisiana Sweet Potato Show Held in Baton Rouge, La.

White and colored farmers of Louisiana were praised recently by Secretary of Agriculture Clinton P. Anderson in a talk at the Louisiana Sweetpotato Show and International Exposition in Baton Rouge, La.

The 25,000,000 sweetpotato industry which the white and colored farmers of Louisiana have developed is an example of the vitality of American agriculture and also is an example of how science serves the farm, said Anderson.

Continuing the Secrteary said, "The United States Department of

More Than Two Hundred Make Tour Of Wake County Farms

Raleigh, North Carolina— More than 200 Negro farmers and homemakers gathered at the Raleigh City Auditorium Wednesday April 28, to take part in a farm and home tour in the Jefferies and Fletchers Grove Communities of Wake County.

The tour with a motorcade of more than a mile long was arranged and led by W. C. Davenport, Negro County Agent, and Natalie Peebles, Assistant Negro Home Agent, both of the State College Extension Service, Raleigh. The purpose of the tour was to acquaint other farmers with the success that farmers in these communities are having in improving their general farm and home practices and raising the standard of living through Extension recommendations.

Beginning on the farm of Mr. and Mrs. Willie Chavis in the Jefferies Grove Community, the group making the tour heard this couple tell how, through hard work and following improved practices, they had made their 38 acre farm provide them with a year-round income. In addition to the home farm, Mr. and Mrs. Chavis own another farm, 57 acres, in the same community. Observations made on this farm were permanent and temporary pastures, home orchard, poultry, toilet, water system, washing machine, refrigerator, good blooded heifer, vegetables and home surroundings.

One of the most interesting observations on the farm of Mr. and Mrs. Dockery Peebles, also of the

Head of Dunbar Life Ins. Company Delivers Message

National Negro Insurance Men Close 1948 Session in New Orleans, La.

New Orleans, La.—With its attendance larger than usual, with a heavy schedule and a well-worked out program for execution, the National Negro Insurance Association closed its 1948 session here with all agreeing that it was one of the best ever held. Among the highlights of the convention was the address delivered by Mr. M. C. Clark, who is president of the Dunbar Life Insurance Company in Cleveland, Ohio. In the address Mr. Clark said:

"Mr. Chairman, Officers and Members of the National Negro Insurance Association, Ladies and Gentlemen:

I am profoundly grateful for the fine support and cooperation which I have received from the member companies and underwriters associations of our organization during my term of office. I am grateful for the high privilege and honor which have been mine to serve as President of our Association. If my administration has, in any wise, been a successful one, that success has, in its largest measure, been due to the wholehearted interest and enthusiasm manifested by Mr. James H. Lewis, Chairman of our Executive Committee, Mr. A. P. Bentley, Secretary of our Association, the other officials, and to the untiring efforts and the accomplishments of our several committees. When the reports of our National Collection Month Committee and our National Negro Insurance Week Committee are submitted for your consideration and action, I am confident you will be pleased with the manner in which these committees have functioned in the interest of our Association, our race and our nation.

I wish to express my sincere appreciation to Mr. Claude A. Barnett, Editor-in-Chief of the Associated Negro Press. Mr. Barnett has actually solicited releases from us relative to our activities. I wish also to express my gratitude to Dr. Henry Allen Boyd, Churchman, Banker, Editor and Publisher. Immediately following the close of our convention held in Detroit last year, I received a letter from Dr. Boyd, offering, without cost to us, the columns of his newspapers for news releases concerning the activities of the Association. A roster of our member companies is carried in certain of the Sunday School literature published by Dr. Boyd.

We are grateful to all of our newspapers and magazines and to their columnists who have publicized the activities of our organization and our member companies.

Pastors of many of our churches throughout the country, and social and civic agencies have been most co-operative in aiding us in prosecuting our several projects. To these individuals and organizations we express our thanks and appreciation.

Public Relations

I trust that we shall appropriate to our Public Relations Committee sufficient funds to enable this Committee to use the columns of our papers and magazines for the dissemination of news and human interest stories concerning our activities and operations. Mrs. M. Mae Street Kidd, Chairman of our Public Relations Committee, with her training and experience was seriously handicapped because of inadequate funds with which to work. A powerful public relations and educational program should be instituted by our Association. Our public must be taught the true value of life insurance in order that a great appreciation for its services may prevail. Our field forces and office personnel must be trained in the principles and fundamentals of the institution of life insurance in order that they may command the respect and confidence of the insuring public.

Safeguarding Our Economic Gains Through Research and Conservation

The National Negro Insurance Association occupies an unique position in the lives of the American people. Its contribution to the economic and social betterment of America, through its member companies, is second in importance only to the group which it immediately and directly touches. The general theme of this convention, "SAFEGUARDING OUR ECONOMIC GAINS THROUGH RESEARCH AND CONSERVATION," is most timely and appropriate, for in our struggle we have made economic gains, and through research and conservation we shall safeguard them and continue our struggle until we have established for ourselves and for our posterity a more enviable place in the economic life of our nation.

Progress

Progress that counts is progress based upon facts—not fancies. The progress made by the member companies of our Association is real; it is based upon facts. The total insurance in force of our member companies on December 31, 1937 amounted to $272,527,288 and our total admitted assets amounted to $20,092,955. Our statistician reports insurance in force and admitted assets of our member companies, as of December 31, 1947, as $907,605, 922 and $94,639,377, respectively. According to our statistician's report, the member companies of our Association on December 31, 1947, had mortgage-loans outstanding in the sum of $12,875,000 I believe we should increase our investments in mortgage loans as rapidly as our resources will permit. Our yield from this type of investment will enable us to more nearly meet our interest requirements, and, at the same time, render a much needed service to our clientele.

Our progress, however, is not to be measured alone in dollars and cents, bonds and mortgages, and other tangibles. Our greatest gains have been in a growing mental emancipation and its spread to others with whom we come in contact. When we become fully emancipated in our thinking—when we have rid ourselves of fear and those other complexes which confuse and limit us to narrow confines—the world is ours. In the same manner in which we safeguard our economic gains through research and conservation, we may also, more rapidly increase our economic gains by raising our sights, by viewing our country and our world in their fullness—not as Negroes, but as men and women—as citizens of a great democracy.

Our Way of Life.

I have an abiding faith in America and in American institutions. I believe firmly in our free enterprise system and in our way of life. The wrongs from which we suffer and the ills of which we justly complain can and will be righted under our democratic system of government. We should continued to wage a relentless war against every individual and every group who would deny us our constitutional rights and, at the same time, we must assume our full duties, obligations and responsibilities as first class American citizens. In proportion as we strengthen ourselves economically, in that same proportion will we improve our citizenship status.

The National Association for the Advancement of Colored People is the one organization which has, through the years, waged war against the injustices and discriminations of every kind perpetrated against us. We should unqualifiedly support this organization by giving freely of our time, talents and money to its over-all program. If there is any reason why our individual companies cannot make annual donations to the National Association for the Advancement of Colored People, we as individuals should consider it our responsibility to see to it that the program of the Association is adequately financed.

The proposed Regional School Bill represented a compact between the Governors of 15 Southern States, which Bill was introduced in the United States Senate and was successfully opposed, largely through the leadership of the N. A. A. C. P. Your President attended a hearing on this Bill before the Senate Judiciary Committee on March 13, 1948, and I trust the brief which I presented in the name of the Association meets your approval. My statement before the Senate Judiciary Committee follows:

"I wish to make it very clear to this committee that the organization I represent, the National Negro Insurance Association, a federation of 50 life insurance companies, with assets in excess of $100,000,000, is unalterably opposed to the proposal now before it, designed to give congressional blessing to the reprehensible compact between southern governors to finance and operate segregated regional schools. We understand that this plan contemplates taking over Meharry Medical College at Nashville, Tennessee, and operating it as a joint school for the education of colored doctors and nurses. Our principal objection to this arrangement lies in our firm belief that such a proposal is a deliberate evasion of the ruling handed down by the United States Supreme Court, making it mandatory that these petitioning states provide equal educational opportunities for their citizens, rgeardless of race, creed, color, or national origin.

"This regional proposal, unless changed to develop unsegregated regional schools for the white and Negro citizens of the affected states, can in no manner be regarded as promising equal opportunities and facilities for all persons. It is our thinking that any arrangement that would compel a Negro citizen of one of these states to journey into another of these states for an education, while at the same time a white citizen of that state is afforded such educational facilities within the border of his native state, does not come within the province of the High Court's ruling in this matter. Bitter experience is our teacher, and we have found that wherever the Negro is forced to accept separate or special accommodations, he inevitably is the recipient of inferior training and facilities.

"It has been argued that these states are too poor to provide equal though separate educational facilities to their white and colored citizens and that it becomes necessary to use the combined resources of all of these interested states in order to provide the type of high educational facilities desired by the litigants in the recent Supreme Court cases. But this argument falls of its own weight when we consider the enormous expense to these states which persist in piling up these systems of separate and inferior schools for Negroes.

"The time has come when a vast number of Americans have come to the conclusion that we must defend the rights of every minority group for which the Bill of Rights was written if we are to maintain our position as the world's outstanding example of working democracy.

"The position of this committee should be clear: As representatives of all the people in all of the states of this great nation, it must agree that we are obligated both by Supreme Court edict, and by common decency to furnish our Negro citizens with equal educational opportunities. It is our considered opinion that endorsement of this regional proposal would do much to retard the splendid progress that looms ahead in the educational future of the nation.

"We are grateful for this opportunity to give expression of our unqualified opposition."

Instead of crying and complaining about our lot, we should improve our lot by doing the things others have done who have improved their lot in American life. I am reminded of the drunk who staggered home one night and made his way subconsciously through the house, winding up in the stall shower of his bathroom. As he groped about, he turned on the water, deluging himself and making a racket which brought his wife to the scene. Taking on the details, she called him all kinds of so-and-so's, winding up with a none-too-flattering estimate of his past, present and future. "That's right, honey," admitted the shuddering so. "I'm everything you said and worse, but let me in, won't you? It's raining something awful out here." When the Negro fully realizes his possibilities and potentialities in a country such as ours, he will find himself no longer out in the rain.

Our Ecnoomic Salvation

Thirteen million people with an annual income of more than $10,000,000,000 can buy and pay for their own economic salvation and win for themselves the same respect enjoyed by other minorities. Thirteen million people constitute an important consumer market for the purchase of all commodities. In order that we may visualize the economic potentialities within our group, we have but to think of the Dominion of Canada. Canada's population last year reached 12,307,000, according to the Bureau of Statistics. The Canadians have their banks, insurance companies of every kind, manufacturing establishments, and a commercial life that establishes the Dominion as one of the world's most important markets.

Former Governor Ellis Arnall of Georgia, and President of the Dixie Insurance Company of Newman, Georgia, had this to say about his company: "I hope to reduce the flow of 125 millions which Georgia now sends to foreign insurers. The assets of the Dixie Insurance Company will be used to stimulate Georgia development." We must reduce the flow of the millions which our people pay annually to insurers which give us the minimum for our money, and direct the flow of these millions into our own companies for our own racial development. There is a steady rise in the volume of insurance in force. It is gratifying that our member companies are sharing in this increase. I deplore the fact, however, that our share is far below what it should be. It is our full resposibility to do something about it.

A New Economic Philosophy

There must evolve a new concept—a new economic philosophy within our group if we would raise ourselves to first-class citizenship status. Trade and commerce are the backbone of the nation. We must participate more fully in the nation's trade and commerce. The member companies of the National Negro Insurance Association have done more than any other agency to enlarge our scope of thinking, to raise our sights, and to strengthen and stabilize our economic life. Our insurance companies have the blueprints of the economic destiny of our racial group for today and tomorrow. Our one big job now is to develop amongst us technicians to interpret properly these blueprints, draw plans and specifications, and erect a financial structure that shall solve our economic problems and fully integrate us into the commercial and financial fabric of our nation. Many of these technicians will come from the men and women of our agency force, the men and women who are close to the people—who know the ambitions and the aspirations of the forward-looking masses. We are all agreed that life insurance should be every man's first step in creating an estate and that no man should postpone buying adequate life insurance. We know that there is no substitute for life insurance in the lives of individuals. What life insurance does for the breadwinner and his family, it can and will do for the race—when we life underwriters and executives develop the programs of our companies to their fullest capacities. What have we done to scotch the economic and social gains made during our war economy? Shall we revert to the unenviable position which we occupied before the war, or shall we continue to make gains during the postwar era? The sainted Frederick Douglass once said: "Neither institutions nor friends can make a race to stand unless it has strength in its own legs." We have the strength to stand, to hold the gains we have made, and to continue to improve our position in American life. The combined strength of the field forces of our life insurance companies is the greatest economic power in Negro life. It is ours to educate our people in the ways of thrift and industry; to inculcate into their hearts and minds a burning desire and zeal to emancipate ourselves, through the institution of life insurance, from the throes of poverty and its attendant evils.

Groups and races within a nation who fail to participate in the industrial, commercial and financial life of a nation, on the same basis as others, will forever occupy the lowliest position in society. The people who own, control and operate the mines, the agriculture and the marketing of that agriculture, the transportation on land, on sea and in the air, the construction industry for the handling of materials, are the primary figures in the market places, in the councils of law, and in the literature of the nation. Our insurance companies, through their thousands of representatives, can raise the status of our group from its present position of uncertainty and insecurity to one of strength and power.

Specialized Training

Life insurance is a highly specialized and technical profession. There are very few, if any, other professions in which the opportunity to serve is as great as it is in ours. It is imperative, therefore, that we thoroughly prepare ourselves through special training for the responsibilities we assume when we engage in the sale of life insurance and in guiding and directing the affairs of our companies. The time is here when the managements of our companies should get together and devise ways and means of more successfully coordinating our programs and activities, if not actually to seriously consider the matter of mergers and or consolidations in the interest of greater efficiency and lower operating costs. I don't believe we should encourage the organization of any new life insurance companies at this time; on the other hand, every effort should be made to stimulate more rapid growth of the companies we have already.

Competition and Operating Costs

Competition for both industrial and ordinary business will be keener than ever before. Many companies which heretofore have not solicited business from Negroes will begin to go after this business in a large way. Some of these companies are employing Negro agents in increasing numbers for the obvious purpose of making their solicitation of Negro business appear more attractive to our clientele. Certainly we cannot cope with this competition unless we are able to reduce our operating costs, and we cannot do this unless we materially and more rapidly increase our volume. In Cleveland we have ten companies operating, all members of our Association. In some of our cities we have considerably more than that. The cost of maintaining these separate offices is an item which could be reduced by our coming together, erecting or purchasing a building to house these offices. Such a program as this might well be the first step towards

mergers and consolidations until we would have not more than twelve large, strong companies operating throughout the length and breadth of this nation. We have built a few companies with insurance in force in excess of $100,000,000. I am anxious that we build some companies with assets of a hundred and more millions in the interest of a larger service and lower costs of operations.

Executive Director

History was made on January 17, 1948 when the Executive Committee of our Association met in Durham, North Carolina, as guests of the North Carolina Mutual Life Insurance Company. At that meeting the matter of employing a full-time Executive Director for our Association was thoroughly discussed. The chairman appointed a committee of three of its members to accept names from which they could recommend to the Executive Committee qualified persons for the office of Executive Director, and from which a suitable person may be selected. This is a forward step. I trust that if the selection has not already been made, that it will be made without further delay.

Recommendations

I recommend that our Association make a more liberal appropriation to the special committee of technicians which was appointed some time ago to study our common managerial problems and develop scientific management techniques.

I recommend that the name of our Association be changed so that the racial designation is removed. The racial designation, which is a symbol of discrimination. Our Assoication has outgrown the name which circumscribes and set us apart from others engaged in the same industry or profession.

I recommend that the Association establish a convention city and the expenses of holding our convention be borne by the Association.

Finally, our insurance companies constitute our first line of economic defense. The growing resources of these companies furnish a reservoir of sufficient financial strength to initiate and carry through a sound and constructive program for the economic and social emancipation of our group. Let us, in our 28th Annual Convention assembled, rededicate ourselves to the principle enunciated by our founders, and project ourselves and our companies more militantly, more efficiently, and more effectively into the procession of the forward-looking masses.

"We have tomorrow bright before us, life a-flame;
Yesterday, a night-gone thing, a sun down name;
And today, broad arch above the road we came."

Varieties Thrive Best In Kentucky

Twelve kinds of dark tobacco have done best in 20 years of testing at the Western Kentucky Experiment Sub-station at Princeton. More than 30 varieties were grown in the tests.

The 12 varieties, listed in order from highest to lowest yields, are Improved, One Sucker, Clarksville Broadleaf, Little Orinoco, West Ky. 1, Little Crittenden, Rudolph Improved, Black Kelley, Broadleaf, Greenwood, Improved Smith Type, Madole, Brown Leaf and Owensboro Greenwood.

The report of the experiment substation said:

All of the above are satisfactory varieties capable of producing good yields of high quality tobacco. They differ somewhat in size and shape of plant and leaf and time of maturity but all are good, dark types. The difference in yield of these twelve has averaged only about 200 pounds per acre from highest to lowest. Brown Leaf and Owensboro Greenwood, although lowest in yield, being of narrow leaf, are usually highest in quality.

Clay Soil for New Homes Not Suitable for Lawns

By DR. FLOYD BRALLIAR
Garden Editor
The Nashville Tennessean

More than the normal number of new houses have been built or will be built with the ground around them filled in and graded with clay dug from the foundation or trucked in from some equally undesirable source.

This soil is either almost wholly unproductive or it is filled with seed of undesirable weeds and grasses. In either case it is wholly unfit for seeding as a lawn, yet the unsuspecting owner either sows it himself or hires some unreliable or uninformed person to do this for him. Many letters are received at this time of year just after it is too late to get good results from the spring sowing of the lawn, asking what they can do to get a good lawn at once.

Plant Peas on Lawn

For several years we have advised such people to plant or sow their lawn with crowder peas, to pick the peas when they are ready and turn all of the pea vines under late in September and work the soil down well and let it lie two or three weeks and then sow it.

The peas will have loosened the soil, and stored an abundance of nitrogen there, and as the vines decay they fill it with humus as well as with additional fertilizer. We received a letter from one of our readers asking about some other garden matters and then telling of her experience in securing a good lawn We are quoting just as it was written.

Planted As Instructed

"I wish to take this opportunity to tell you about my nice lawn, since you gave me the planting instructions. I wrote you two years ago for instructions, as we had just filled in our yard with poor soil which came from beneath the pavement. As you instructed us, we planted it with crowder peas sowing them in rows about 12 inches apart. Those peas grew like Jack's beanstalk. I had pictured neat little rows of peas about eight or 10 inches high with me walking down the rows picking peas. Imagine my amazement when those vines were soon literally waist deep, I picked peas from the safety of the sidewalk most of the time.

"When I did venture into the maze of vines I was ever mindful of the danger of getting lost in my own front yard! The two large deodra trees were a challenge to those peas, and would have been completely covered if we had not dragged the vines back every few days.

Show Place of Town

"The yard was the show place of the town. Many people stopped to ask what was growing, and everyone gaped at the yard Two or three motorists had near accidents from looking back in amazement. My husband and son lounged on the front porch, enjoying the absence of grass to mow. But when fall came they really labored for a couple of days in cutting up the vines and spading them under. It was impossible to spade the whole plants under, so the two of them went into consultation. Soon they appeared in the front yeard armed with antique swords which they used as implements of destruction on the pea vines. When the ground was in good condition, we sowed the grass mixture you recommended, bluegrass, Herd's grass, English rye grass, and white clover. In a short time we had a beautiful green lawn which compensated us liberally for the trouble of spading in the peas, altho we had already been paid for the extra labor by the elimination of the old coarse grass which had previously grown on the lawn, and by not having to mow grass all the year."

We might multiply experience of this kind had by these who followed this method of preparing the ground before sowing the lawn but this story is so well told and is so typical of the other experiences that we consider it sufficient. Any of the crowder peas will do for this purpose. Plant the one you like best for table use You may not like to use your future lawn in this way but we know of no other way that the soil can be put in as cheaply, and unless the soil is put in proper condition before the lawn is sowed, it is almost impossible to get a strictly first class lawn.

If you cannot get crowder peas for planting, use whipporwill or any of the other strongly vining varieties of cow peas. Plant them early so as to get them started early enough to smother out all weeds and other noxious plants.

In Making Garden Plans Don't Forget Winter Crops

By DR. FLOYD BRALLIAR
Garden Editor
The Nashville Tennessean

In planning gardens, don't forget all-winter crops.

Purpkins and winter squashes are among the most desirable of winter vegetables; yet many growers do not raise any. Squashes and pumpkins are not only rich in vitamins, but they contain much more actual food than most vegetables. Properly grown and properly stored they can be kept all winter.

First, we wish to mention the cushaw, a type of pumpkin, that is usually thought of as a squash, because it closely resembles the best winter squash in flavor.

Many Varieties

The cushaw may be had in several colors. white, striped, yellowish-buff, and pure deep green. The deep gren variety was introduced years ago and became very popular for a time under the name of Japanese alphabet squash, because the seeds have a very thin outer covering that sticks tightly to the main seed covering and when the seed dries, little cracks appear in the outer coat that have the general appearance of the Japanese letters. Recently a new summer variety of cushaw has been introduced under the name of butternut squash.

It is claimed to have the best flavor of any of the family, but is much smaller in size than the other.

Easily Grown

Any of the cushaws are easily grown and produce a heavy yield. If given rich soil, and provided with enough water to keep them growing through the hot dry weather of late summer and fall, they often produce fruits weighing 10 to 15 pounds each; but this is no particular draw back, for a large enough section of the neck can be cut off for immediate use and another section may be cut off a week or two later, and so on until the entire fruit is eaten.

In order to keep cushaws or any other pumpkins or squashes they should not be picked until they are thoroughly ripe but they should not be allowed to receive a heavy freeze before they are picked and put into storage. They keep much better if the stem that holds them on the vine is left on the fruit. Be careful to not bruise them too much in handling and place them in a dry place where they will not get damp at any time.

Good Circulation

They should have good circulation of air, and of course the temperature should never fall below about 40 degrees. Handled in this way. most varieties can be kept as late as the first of May without any trouble.

Aside from the cushaw pumpkins, we recommend buttercup, squash. acorn squash, Fordhook squash, and the Tennessee sweet potato pumpkin. While it is not yet time to plant any of these, this is the time to make sure of geting the seed and so arranging the garden that you will have room for them when the time comes to plant for winter use, which means sometime in July.

A ton of barnyard manure left in a lot or stable isn't worth a dime but when spread over a crop at the right time could be worth several dollars.

Overgrazing Called Blow to Pastures

Good seed bed preparation is of great importance in the growing of a permanent pasture, H. W. Wellhausen, agronomist with the agricultural extension service in Knoxville, told delegates of the Tennessee Dairy Committee, Friday.

Speaking at the spring meeting of the committee in the Andrew Jackson, Hotel. Wellhausen emphasized that proper grazing of pastures by livestock will leave two or three inches of grass at all times.

The committee met for the purpose of discussing dairying, and mapped a long range dairy program for the state.

In showing slides on pastures and top soils. Willhausen explained that overgrazing of pastures means a loss to the dairyman. His grass and hays are hurt by the overgrazing and then, too, it was explained, there is less food for the livestock from the acre of ground.

Spot grazing, he said, is not getting the efficient use of the pasture land. The cattle, Wellhausen declared and other livestock will eat the tender blades of rass and leave the tough. If the land had been properly grazed there would not be any of the tough grass which go to waste with spot grazing, he said.

He urged farmers and dairymen of the state to seed sizable acreage of Alfalfa this next year. It will help overcome the pasture problem, he declared.

Silage, grass, sorghum and corn are important crops in the dairying industry, John Ewing, superintendent of the Columbia Experiment station told the group.

Other speakers on the morning session included R. H. Lush, dairy husbandman for the Tennessee Experiment Station, who talked on economical milk production on pasture; Woodrow Luttrell, county agent for Rutherford County, who discussed emergency pastures; and G. L. Cleland, Williamson County agricultural agent who talked on fall and early spring pastures.

Talks Friday afternoon were made by J. J. Crane, rural electrification expert with the agricultural eytension service, who discussed water on the farm; Art Farrar, district production manager for Kraft Foods Co., who talked on production of quality milk; D. C. Alspach, district production manager for Carnation Co., who discucced milk haulers relation; and Lynn Copeland, district dairy specialist with the extension service, who talked on herd management.

Farm Talk with Farm Folk

By Jesse Safley

There will be a lot of "clod hopping" farmers this summer unless something is done about the clods. We have noticed many acres of broken farm land where the clods have been completely ignored by farmers who are in a hurry to complete their spring plowing.

This is a serious mistake, especially at this time of year when one day of hot sun will dry out and harden the clods to such an extent that is will take several days of rain to soften them.

The farmer will gain little by breaking soil in a rush and allowing it to remain cloddy. He should take the additional time necessary to pulverize the soil.

The unusually heavy rain and snow in February and March left the soil in a packed condition. This, plus the fact that many pasture their livestock when the fields are wet, account for the clods.

Plowing now should be followed immediately by harrowing and in extreme cases, discing. Many find that a light discing before plowing reduces the amount of clods.

Don't plant a crop under clods on the strength of expecting a heavy rain within a few days. Expected rains seldom come. When they do, it's either not enough or it is too late.

Farmers are at it again. They are saying: "I am going out of the hog business." Prices have dropped so low that they believe hog production is no longer profitable.

Many of these disgusted farmers are those who bought their breding animals when hogs were at the highest. They can't see the quick money anticipated with declining prices.

Experienced farmers who have watched conditions and prices pass through many cycles agree that no livestock program can be called profitable in a few months or one to two years.

There are occasions when farmers probably lose money on hogs than any other type of livestock. This is true because so many buy into the business on a high market and sellout on a low.

The only safe way to profitably produce pork is to employ proven economical feeding methods and keep at the job. Never sell completely out of breeding stock because of price recessions. Reduction in number is often advisable.

Many make a mistake of attempting to produce more than their farm will carry. It is far better to produce a smaller number through good managemnt than a larger number with poor practices.

agement than a larger number with poor practices.

The hog population is below normal and all indications point toward profitable pork production during the next several months at least. Farmers who sell 4 Farmer Doris 6-5-48
completely out for price reasons alone are not following good management.

Clean-Up Time

The spring and early summer community clean-up is one of the oldest and most valuable of American institutions. It makes for attractive homes and towns. According to medical men, it helps fight disease, by getting rid of germ-filled refuse. And it is absolutely essential to fire prevention.

Many fire departments have on hand self-inspection guides prepared by the National Board of Fire Underwriters. The advice given is simple - - and it is also vital to domestic and industrial safety. All rubbish in and out of buildings should be gathered up and disposed of. Heating equipment of all kinds should be inspected by experts in order to ready it for hard use next winter, and needed repairs should be made at once. Electric cords, lamps, and appliances should also be checked for possible dangers. Flammables such as paint and cleaning liquids, should be carefully stored, and rags which are used with them should be kept only in closed metal containers.

Careful clean-ups were never more needed than now. Last March alone, fire destroyed over $74,000,000 worth of property --a jump of about 2.5 per cent over the same month a year ago. Unless it is checked, a new high record of waste will again be established this year. These dollars are represented by lost housing, buildings, food raw materials, manufactured goods, and everything else that can burn. And along with property, fire takes more than 10,000 lives annually. The spring clean-up can be one fire's most effective enemies.

ORANGE WAFFLES

For waffle variety, add 1 tablespoon grated orange peel to your favorite waffle batter. Bake as usual and serve topped with orange slices and honey.

THE FORUM

The Modern Farmer

Published monthly by the Modern Farmer at Nashville 3, Tennessee.
Giles A. Hubert,---------- Contributing Editor
---------- Secretary
Sadie Wilson ---------
Henry Allen Boyd.---- Publisher
Office, 403 Charlotte Avenue.

Devoted to the interests of the Farmer, Truck Gardner, Livestock and Poultry, Breeder, the Home and the People.

Entered as Second Class Matter, April 10, 1929, at the Post Office at Nashville, Tenn., under act of 3, 1879

All contributions for publication in the Modern Farmer, should be addressed to The Modern Farmer, 403 Charlotte Avenue, Nashville 3, Tenn.

No libelous matter will be published. Unsigned articles or letters, and those written on both sides of the paper will not be used.

Subscription price $1.00 per year, 75c for six months, payable in advance. Personal checks must be certified. Make all checks or money orders payable to The Modern Farmer.

Advertising rates and sworn circulation figures presented upon application.

Second Spring Show

(Continued from page 1)

per pound, tripped the scales at **224 pounds** at **7 months old,** and was brought by **Abraham Packing Company.** This is a good grade **Duroc,** fed a ration of corn, proteins, minerals and good pasture.

Norman Davis of **Haywood Co.,** camein for a close second, with the **Reserved Champion,** a good grade Poland-China, **5 months old,** weighed **188 pounds** and was bought by the**South Memphis Parking Company** at **$.60 per pound.**

The quality of hogs brought to the show is improving each year: better blood, better feed, balanced rations, and better handling and care. **2,891** boys and girls of the state are carrying Pig Projects this year.

This is the second Spring District Show and Sale participated in this year. Many county shows and the Tri-State Fair will see many other 4-H pigs this Fall.

Secretary Anderson

(Continued from page 1)

Agriculture in its own research program and in cooperative projects with State Experiment Stations is seeking to make the sweetpotato more profitable to producers and more useful to the people of the Nation."

The Secretary suggested that improvements in storage may make it possible to market sweetpotatoes over a longer season. And greater efficiency in production, handling, transportation, and merchandising, Anderson asserted, offer possibilities of providing a better product with a saving to both producer and consumer.

Secretary Anderson also pointed out that Dept. research people have recently devoloped a new variety of sweetpotato which offers promis as a scource of tubers for livestock feed. Sweetpotatoes can be made to produce big yields on soils that are not well suited for grain production, he said, this fact makes the sweetpotato a big asset to the Southern program of diversification.

As to starch production from sweetpotatoes, Secretary Anderson said he had been informed by research people that good starch production methods have been developed, but that commercial use of the methods will have a better chance when varities better adapted to starch production become available.

More Than Two Hundred

(Continued from page 1)

Jefferies Grove Community, was the tobacco barn stoker which is used in curing their tobacco crop. Mr. Peebles told the group that he could cure one barn of tobacco for approximately $7 with his new stoker. This, he added, is much cheaper and better than the wood furnace which he formerly used.

The group also took great interest in observing a tool shelter, lawn, shrubbery, washing machine, refrigerator, telephone, a new cinder block house for his tenant and general surroundings.

Continuing into the Fletchers Grove Community, the first step was made on Mr. and Mrs. Thannie Holden's farm. It was brought out that the Holdens have been on their farm only nine years. The practices which they are following are not only meaning extra income at present, but are also paving the way for a better system of farming in the future.

The Holdens also pointed to their lawn. shrubbery, walk ways, brooder house, clothes line, remodeled house, washing machine, tool shelter, and general surroundings. ---------

The last step on the tour was at Mr. and Mrs. Ivory Leathers' farm. Mr. and Mrs. Leathers have recently completed a new six room home which they built themselves. Mr. Leathers stated that this new house was built at a cost of approximately $2000. This was possible because he and his family did the work. Only $230 was spent for hired labor.

Other observations made on this farm were lespedeza, truck crops. pasture, lawn, shrubbery, walk ways, outbuildings construction, and general surroundings.

Also seen on the tour were E. R. Collins, Head Agronomy Department; C. F. Tarleton, Editorial Staff, both of State College; R. E. Jones, Negro State Agent; J. A. Spaulding, Negro District Agent; and Miss W. R. Laws, Negro District Home Agent, all of A. and T. College, Greensboro; Revs. T. C. Namans, J. W. Watkins, and Wiliam A. Perry, all of Raleigh; Rev. Perry is pastor of the Baptist Grove Church in the Fletchers Grove Community; R. L. Raiford, Executive Secretary of the Bloodworth Street Y. M. C. A.; Mrs. P. P. Haywood, Secretary to Wake County Farm and Home Agents; E. E. Evans, Assistant Negro County Agent; Jessie Dickerson and Charles Watts, Veteran Teachers, Method; E. C. Debnam, E. L. Roberts and Richard Barfield, Veteran Teachers, Shephard High School, Zebulon.

Negro Older Youths

(Continued from page 1)

Window Panes; October; Purebred Bulls; and November: Records and Older Youth Achievement Days.

The Council also planned a one day picnic for all Older Youth Club members at the Norfolk Beach, Wednesday, June 30.

Organized Older Youth Clubs are in the communities of Eagle Rock, Jefferies Grove, New Hill and Shiloh.

E. E. Evans, Assistant Negro County Agent and Mrs. A. B. Alston, Acting Negro Home Agent, also assisted with the Council Organization.

One Hundred

(Continued from page 1)

South. Family workers accounted for 4,532,000 of these and hired workers, 1,278,000. This represented a decrease of over half a million in the number of family workers, but an increase of about 100,000 in the number of hired hands. However, from the long-time point of view, there was also a decline in the number of hired workers for this date as compared with the same date during the period 1935-39. The long-time decline in hired hands amounted to 95,000.

Workers in the South were busy harvesting sweetpotatoes, corn, peanuts, tobacco, and sorghums. In some areas they were still picking cotton, and in others they were seeding fall grain.

Among the farm workers were about 6,500 West Indians. They were working principally in Connecticut and Florida. A breakdown of these workers shows that 3,449 of them were Jamaicans, 2,428 were Bahamians, and 343, Barbarians.

To Protect Trees, Shrubs Destroy Tent-Caterpillars

By DR. FLOYD BRALLIAR

Garden Editor
The Nashville Tennessean

We should have written this article a week ago but other things seemed more important at the time.

But it is not too late if the suggestions we are making are attended to at once.

Every one who has any trees or shrubs should go over them at this time looking for colonies of tent caterpillars. They can be readily seen because they are semi tent-like in appearance and are made of silk that as the color and appearance of spider web.

They are almost always located in the forks of limbs, usually where two or three limbs grow out close together. Tear into these tents and you will find they are filled with dozens of caterpillars. These caterpillars have woven this tent as a protection against birds and other enemies.

Come Out At Night

They remain in the tent practically all day and come out after the birds have gone to roost and feed on the leaves of the tree. Their tent protects them from sprays and dusts. These pests are now nearly grown and if not destroyel within the next few days they will reach maturity - at which time they will crawl off the tree and seek some shelter.

They pass into the pupa stage where they will remain until early next spring. They are especially bad on any of the fruit trees, either ornamental or commercial, and on wild cherries of all kinds; they also attack other growing shrubs and trees.

There is no need to look for them on evergreen trees. A little work now will prevent your grounds being heavily infested with them next year.

Pull Off the Tent

Many people destroy these pests by burning them and their tents with a torch, but we do not recommend this except where the tents are too high to reach othrwise, for often more damage is done with a torch than by the caterpillars

Our method is to pull off the whole tent with our hands, throw it down on the ground and mash it until all of the caterpillars have been killed. With a little experience one can tear out a tent, throw it on the ground with all of the pests on the inside. He may leave an occasional caterpillar on the tree. but they will do no harm. They cannot survive unless there are enough of them to construct promptly a new tent.

Dr. J. G. Knapp, New Associate Chief of FCA's Cooperative Research And Service Division

Washington, D. C.--The appointment of Dr. Joseph G. Knapp as associate chief of the Cooperative Research and Service Division of the Farm Credit Administration was announced this week by Harold Hedges, chief of the Division.

Dr. Knapp has been in charge of the Cooperative Purchasing Section of the Cooperative Research and Service Division since 1934. Prior to that he was associate professor in charge of marketing research at the North Carolina State College of Agriculture.

In his new position Dr. Knapp will be particularly concerned with the direction of the Division's research activities. He will have wide contacts with cooperative associations. land grant colleges, and similar organizations in all parts of the country.

Dr. Knapp's interest in agricultural cooperation goes back to 1924 when as a fellow of the Food Research Institute, Stanford University, he made studies of the California cooperatives and of the wheat pooling movement. In 1926 he joined the staff of the Brookings Institution to work with Dr. E. G. Nourse on a study of the cooperative marketings of livestock. At present he is again working with the Brookings Institution - - under a periodic leave - of - absence arrangement - making a study of the cooperative form of business enterprise.

Dr. Knapp took his undergraduate work at Colorado State Agricultural College, the University of Illinois and the University of Nebraska. His graduate work was carried on at the University of Nebraska, the University of Chicago, and at Stanford University where he was granted a Ph. D. Degree in 1929.

Author of a wide variety of material, Dr. Knapp has written many articles and bulletins as well as two books in the field of agricultural cooperation. The first is a study of the hard winter wheat pools published by the University of Chicago Press in 1933. The other is a book written with Dr. Nourse on the cooperative marketing of livestock, published by the Brookings Institution in 1931.

His work with and studies of cooperatives has carried Dr. Knapp into every state, the British Isles and Canada. He has had a lifelong interest in the welfare of Agriculture. As a boy he worked in the Colorado sugar beet and grain fields and later on a Colorado ranch. His business experience includes the operation of a truck farm, and work with a farm equipment company.

Corn Belt Faces Prospect of No Drought or Flood

Bowling Green, Ohio, April 12 (INS) -- Corn belt farmers will face neither flood nor drought this year. You can take the word of 83 year old Professor Edwin Lincoln Mosely for it.

Dr. Mosely, professor emeritus of biology at Bowling Green State university, has been making long range weather forecasts with pretty fair success for many years. He bases his predictions on his theory that rainfall in an area repeats itself every 90.4 years, or four times in the magnetic sunspot cycle.

Dr. Mosley expects corn belt floods next winter or spring, but no serious drought until 1950.

However, the outlook farther east, in Western Pennsylvania and most parts of Ohio, Indiana and Kentucky, is for some shortage of rain late this spring and early this summer, but an excess from then on until August, 1949.

He predicted a surplus of rain for northern Ohio in 1949 only in the first few months.

Dr. Mosely has been working on his theory most of his time since his retirement from the class rooms in 1936. He stated that his prediction of a widespread drought in 1946 was "abundantly verified," while his 1947 predictions, he claimed were "unsatisfactorily" only in Ohio and Kentucky.

Cotton Picking Machines Due on Big Scale This Year

MEMPHIS - (AP)-- Monstrous machines - - looking like evil implements of war - - will roam along the South's cotton rows this fall.

They're mechanical cotton pickers now being produced on an assembly line basis for the first time. They may provide a partial answer to a question brought up more than a decade ago:

How will machines affect the South's economy. ,

About 1000 of the five ton devices are gonig to be put to work when it's cotton picking time again. Early models appeared more than 12 years ago but since then only 200 or so have been built - - and they were hand-assembled.

Rolling Off Line

This year they began rolling off the line at the Memphis plant of the International Harvester Co.

The latest machines can move through the white fields at two miles an hour, picking 1500 pounds of cotton in about two and a half hours. Each is capable of collecting 600 bales in a season under ideal conditions. Actually, the average is expected to be about 200 bales.

So it's anticipated that the mechanical pickers will account for only about 10 per cent of the total 3,000,000 bales annually grown in the area to which the 100 machines are being assigned.

Authorities Uncertain

The machines have been pictured by some as a device that would displace millions of field hands and farmers. Others optimistically hoped they would bring about a new era of expansion. They predicted that whatever workers were displaced would be absorbed in resulting industrial developments.

Now, on the brink of the biggest experiment with machines, agricultural authorities aren't sure but some think the optimists may be right.

They say farmers have found that machinery can double or evn triple the acreage average of tenant families. They say tenants can remain on the farms and work at day labor rates. They can pick the first cotton that opens--the bright, high grade type that produces premium prices. That's the kind that mechanical pickers cannot harvest as efficiently as it's manufacturers would like. They take in trash that lowers the cotton's value.

Small farmers can then specialize in better cotton while the machines move along in the middle and low grades. Because of this argument, some experts do not think the little men of cotton farming will be pushed to other pursuits or out of business entirely.

And all agree that the traditional cotton field scene will stay the same for men, women and children --singing in the sun--will keep on doing most of the work when it's cotton picking time.

Plant Most Garden Beans While Weather Still Cool

By DR. FLOYD BRALLIAR

Generally it does not pay to be in too big a hurry about planting beans of any kind, with the exception of the English Broad bean.

The English Broad bean, or Fava is very hardy. In fact it will stand as much frost as our common English of garden peas.

This bean fills an important place in the gardens of Europe, but we have found only three or four gardeners in Middle Tennessee who grow it. Like peas, it is a cool weather crop, but if planted the latter part of February or the early part of March it is almost sure to produce a heavy crop.

Pods Not Edible

Although the dry beans are sometimes used like lima beans, they are grown almost entirely to be used as shelled beans. The pods are not edible. The green beans are very tender and have a sweet taste more similar to peas than to the standard bean. We would like to see a number of Middle Tennessee gardeners give this bean a trial in a small way.

Green podded bush snap beans are more widely grown than any other bean in the south, and no other type of bean has been bred up to its highest state of perfection. The earliest varieties, if not planted before the last week in April, will be ready to pick in about 50 days. If planted two or three weeks earlier than this, they will be ready to pick in about the same time, possibly three or four days earlier, but the yield is almost sure to be considerably smaller if not planted until about April 20.

10 Days Longer

Pole beans usually require about 10 days longer between planting the seeds and picking the pods. Bush lima beans require about the same length of time to mature as the ordinary pole snap beans. The yield obtained from pole beans is usually considerably more than from the same number of plants of the variety, but because the bush varieties are planted much closer together, the yield of a given area is usually considerably larger than from pole varieties.

Most beans prefer a slightly alkaline or a neutral soil with a fair amount of humus in it or even a fairly fertile sand. In making the first early planting it pays to make a furrow about four inches deep and scatter a little complete, commercial fertilizer in it, say two or three pounds to every hundred feet of row.

Cover Fertilizer

Cover this fertilizer two inches deep and plant the beans. For all bush beans the rows should be from 30 to 36 inches apart.

Do not drop the beans too thick in the row. Some growers try to plant one bean at a place three or even two inches apart. We get better results by dropping two beans at six or eight inch intervals. Never cover beans deeper than two inches, and take the trouble to set the lima beans on their edge with the eye down. This is especially important if the soil is not loose or sandy.

Beans should grow in full sun and should be kept from weeds.

Snap bush beans have been bred ste all of their crop at about the same time so they need not be picked more than twice. Bush lima beans will bear almost continuously from the time the first beans set on till they are killed by frost.

Pole beans are not so hardy as bush beans so should be planted for 10 days later, or till the ground is warm. The hills should be three or four feet apart each way. Plant three or four beans in a hill and thin to two when they are six inches tall. Use poles at least six feet long and set them when the seed are planted.

Extra Cautions Urged To Cut Fire Losses

The coming of "fire weather" is a signal for extra caution against farm and forest fires, according to G. B. Shivery, U_T extension forester, who pointed out that fires both destroy timber and leave the land "slick."

Woods fires in April and May are likely to kill timber which might escape injury from the same fire in the fall, because trees are more easily killed or damaged during the early part of the growing season, Shivery said.

Fire also causes loss of valuable plant foods. The nitrogen from burning grass, leaves, and ground litter escapes as a gas into the air. Other essentials such as phosphorous, potassium and lime are left in the ashes and are leargely lost through washing away. Thus, while burning is the easy way to remove grass and other litter, the fire damages the fertility of the soil. Among precautions against fires and spread of fire, Shivery listed the following suggestions:

Burn brush only when absolutely safe on calm days, then after 4 p. m., in small piles after first raking or plowing a clean fire lane around each pile.

Camper should be more careful with fire in the woods. Never throw away a match without breaking it.

Never throw lighted cigarettes from the window of a car. Cooperate in every way to reduce Tennessee's man_caused fire loss, which runs into millions of dollars each year.

Official Copy Policy America's Security Loan

April 15 ____ June 30, 1948 -- --

SLOGAN.

AMERICA'S SECURITY IS YOUR SECURITY BUY U. S. SAVINGS BONDS NOW

THEME:

U. S. Savings Bonds are security bonds. Individuals provide for their own individual security when they invest in U. S. Savings Bonds and at the same time they help to maintain the economic security of our country. Funds reserved by millions of American families mean homes, education of their children emergency funds, and old age security. They mean that these millions of American families are themselves investors _ _ "Capitalists" ___guiding their own, future and the future of the Nation. The success of the Security Loan, and the continued seccess of the U. S. Savings Bonds Program, means more Americans will own more of America. Americans who own these securities (E, F, and G Bonds) have an actual stake in the operation of their government.

PURPOSE:

Why is the vigorous sale of Savings Bonds necessary? For two years the Treasury Department has had a successful Savings Bond Program. The national debt has been reduced over $20 billion from its wartime peak. The amount outstanding today held by individuals _ _ $52 billion _ _ _is a huge reserve of buying power, and every dollar added to this reserve is, a dollar temporarily channeled away from the Nation's market places. At the same time it is a dollar stored away and these dollars _ _ _ billions of them we have saved together _ _ _ can help keep "hard times" away from our door.

The success of the Security Loan will mean, as the economists call it, "spreading ownership of the securities on the national debt. Every Savings Bond dollar built up in your Treasury is used to pay off a dollar of the national debt that is potentially inflationary This is wise debt management TOMORROW _ _ _ the dollars in these Bonds of Security will be ready to help Americans buy the things they need. This helps to maintain a stable economy.

Pumpkins, Squashes Fare Well in Mid-Tennesse Soil

By DR. FLOYD BRALLIAR

Pumpkins and squashes are vegetables that the early American settlers got from the Indians.

The winter squash is not often grown in Middle Tennessee, but now that some of the very best varieties of this family, for example, buttercup, are well adapted to our territory, there is every reason why we should grow them abundantly. They are easy to grow they are easier to keep than sweet potatoes, the vegetable they most closely resemble in flavor. and they are just as nutritous as sweet potato.

Summer Squash Popular

We all know summer squash, for practically every garden has contained summer squash for many years. However, a great many people do not recognize the great superiority of some of the new varieties, such as early Prolific Straightneck. Cocozelle, Zucchini and the Yankee Hybrid, over the older varieties.

Of course, our own personal preference is the Zucchini.

We have all known pumpkins for years, but many do not recognize that the better pumpkins are almost equal to the winter squashes for flavor and that they are easier to grow in this territory. The two outstandingly superior varieties for home use, are the Cushaw and the new Butternut varieties. Butternut is usually listed in the catalogs as the winter squash, because of its high cooking qualities, but it is in reality, a new and superior cushaw.

Excellent Varieties

Then of course, there is a subdivision of the summer squash often listed as summer and winter squash. This is not a large group but it contains some very excellent varieties.

The oldest among these is the Foodhook, a very high quality variety with a sweet potato flavor when allowed to ripen and kept for winter use, and yet it is a superior summer squash when picked when it is not quite half grown, and cooked like any other summer squash. The other most common varieties of these summer and winter squashes , are variously known as Table Queen, of which there is a bush variety and a vining variety, and the acorn or Royal acorn. Any of them can be kept all winter and are especially desirable for baking.

Need Same Culture

All vine crops such as melons, cucumbers, pumpkins and squashes require about the same culture.

We have given this instruction fairly fully under cucumbers, but we will repeat here that they like a fairly new soil, that contains an abundance of humus, and none of them should be planted until the ground is warm. The chief difficulty in growing them is to prevent their being killed by insects while the plants are young and tender.

One of the best ways to combat insects on the plants is to keep them off. The simplest and easiest way to do this is to soak seed over night in kerosene before planting.

You would expect this to prevent the seed from growing but it does not. In fact, it does not injure them at all, although judging by their appearance , after they have been soaked over night, you will think you have completely ruined them.

Plant the seeds the next morning and you will find that insects will not ouch the plants.

This is cheaper and more convenient than waiting for the plants to come up and keep them dusted with insecticide. It does not seem possible but it is true that insects do not feed on the vines after they are old enough and large enough to bear fruit. An occasional insect may get on an old vine, but we have never known them to do any harm.

2,000 Goats To Be Transported to Japan

PORTLAND ORE.— The United States Army has offered free transportation to Japan for 2000 milk goats for relief purposes. The offer grew out of an experiment inaugurated by Oregon Heifers for Relief in sending an initial shipment of milk goats to Okinawa and Japan. These animals were received with such enthusiasm, and give such promise of being most usccessful agents in both relief and rehabilitation, that the Army now has offered to transport the thousands for which requests came from Japan about a year ago.

The first shipment was sent because of earnest appeals from Japan telling of the infantile death rate. In one district in Tokyo the rate was about 130 out of a thousand, and in one country district of 100,000 people the infant mortality rate was fifty per cent, in some villages going as high as sixty-five per cent.

The Okinawa shipment of 191 goats was distributed among sanitaria, hospitals agricultural stations, leper colonies; and only one goat was given to an individual, that individual being the governor of the island. However, when the governor discovered that the penitentiary has received no goat, he presented his to the prison hospital.

Japanese shipments are distributed by the Public Welfare Department of the Japanese government, in cooperation with the American military government, to the same sort of institutions as on Okinawa. The first letter received after the arrival of the goats told how one life had already been saved, that of a baby unable to digest any available food, but who immediately started on the way back when put on goats milk.

"I am very greatly interested in the goats for Japan project and know of no way we can help Japan more at the present moment than to give them these goats. They will provide milk for their children and sustenance for many of the people who need this extra nourishment. The goats for Japan project should be supported by every Christian in America."

J. Henry Carpenter, Secretary
Kagawa Thirtieth Anniversary Fund
Brooklyn, New York

"The down-to-earth, Christian practicality of getting vitamins to Japanese children by shipping over 2000 goats is irresistable. Our church is grateful for this chance to implement how we feel."

"At the Last Judgement aren't we more likely to be on the right side of the tracks if, at this moment, we are for and with those goats?"

Allen A. Hunter, Pastor
North Hollywood Congregational Church

While Saanens are preferred, other breeds are being shipped. Ninety-five percent are to be does, five percent bucks. They must be between seven months and four years of age, and bucks should be registered or sired by registered bucks.

Shipments are scheduled to begin April 29th, and it is hoped that the entire 2000 goats will be on the way by September 20th. Those who can contribute goats, have goats for sale, or wish to make cash contributions, should correspond with their nearest office: Heifers for Relief - New Windsor, Maryland; 1720 Chouteau Avenue, St. Louis 3, Missouri; 30 N. Marion Avenue, Pasadena 4. California; 509 Dekum Building, Portland 4, Oregon.

Plan Now

To clip all pastures infested with broom sage, onions and weeds. Continue the procedure at regular intervals throughout the summer.

To eliminate flies around the house and barn by a thorough spraying of all buildings with DDT.

To purchase baby chicks from dependable dealers only.

To have all necessary equipment and insecticides ready for the first attack of garden livestock with an ample supply of salt. Block salt is not sufficient.

Few Gardeners Know Date To Plant Turnip Greens

By DR. FLOYD BRALLIAR

Garden Editor
The Nashville Tennessean

We find two common errors among gardeners.

The first of these is that turnip greens are a good crop to plant in the spring. We find that some gardeners are still planting seven-top turnip seed hoping to get a good crop of greens from them. Turnips are a cool weather crop and have the habit of "running to seed" before making many leaves, whenever the days are growing longer and the nights shotrer. In middle Tennessee it seldom pays to plant turnips in the spring, and it is certainly not wise to plant them this late.

Second Mistake

The second wrong idea is that kale should not be planted until fall. Kale does produce a crop quickly, and is decidedly hardy to cold, and for this reason it is well suited for fall planting. But it also grows well in the spring and right on through the summer and fall.

It is one of the crops that you can sow early and use continuously for almost a year. Sown now, it would be ready for use in about six weeks, but only the larger leaves should be picked, being reasonably careful not to bruise or otherwise injure the stalk. New leaves will form shortly and in a few days these same plants will be ready to pick again.

Kale is not only one of the heaviest producing of all garden plants, but contains more vitamins than most of them, and actually contains as much food as cabbage or any member of the cabbage family .

Many Varieties

There are several varieties of kale but all are good. Hanover produces a crop quicker than any other variety, and it is probably the heaviest yielder of the garden variety. Dwarf Scotch curled is probably the most ornamental variety on the market, and for this reason is probably the most widely grown.

There is the giant smoothleafed variety grown widely on the Pacific coast for winter cowfeed. This variety produces leaves for fully two feet long and six inches wide. These are produced abundantly and are especially liked by the cow.

Feeds to Cattle

The grower picks the mature leaves and feeds them to his cattle. In about three weeks the plants are ready to be picked again. Of course the grower plants large enough acreage so that he could begin picking on one side of the patch, picking only one day's supply at a time. and by the time he has finished picking the patch, he can start in all over again. While this kale is rather coarse for home use, if we do not use the main mid ribs it is just as tender and tasty as any variety. Kale is best driled in rows and thinned so the plants will stand five or six inches apart in the row. The rows should be at least two feet apart for convenience in cultivating and in picking. Remember the sooner you plant kale, the longer you will have a supply.

To have all cured meat safely stored from rats, cats and insects.

To have seed and fertilizer ready to avoid delay at planting time.

To cooperate with the rat eradication program which is being conducted in your county.

To reduce the onion flavor in milk by removing the animals from the pasture a few hours before milking time. A feed of dry hay will also help.

To start baby chicks at the earliest possible date if you expect to have fall layers.

To obtain fruit tree spray schedules from the State Department of Horticulture.

"Steps in Building a Front-Line Sunday School"

Subject Discussed at Recent Summer School of Methods Held in Kansas City, by Mr. W. O. Mouton of Alameda, Calif.

Ladies and Gentlemen:

Many years ago Sir Walter Scott said, "As the leaders are so will the followers be."

In my estimation the most important steps in building a front line Sunday school are the steps applied in building first line Sunday school teachers.

Someone in a poem said:

"Thanks for the Sabbath School: Hail to the day
When evil an derror are fleeing away
Thanks for our teachers who labor with care
That we in the gospel light may share."

Within these simple soulful lines is a clear keynote to our work. Teachers of the gospel,—in the home, Mission Field, or Sunday School have one thing in common—they are clearing away evil and error—they are devoted in sharing the light of the gospel.

No more precious privilege can come to anyone than this privilege of leading souls into God's sunshine.

Devotion, sustained by growing testimony of the gospel is a first essential in this labor of love. To inspire in others a desire to learn truth, and to live righteously one must radiate such a desire in both words and deeds. This however is not all. Greatest success is won in gospel teaching only when it is based, as was the Master's on the fundamental laws of spiritual learning and growth.

If any teacher would grow in the skill to interpret, to teach to apply the principles of the gospel he must follow the footsteps of the Master. To know His methods thoroughly is to understand clearly all the fundamental principles of soundly progressive education.

Much of the success of the Saviour as a Teacher was due to His Divine personality. He was born leader of men. As the Son of God He possessed the attributes of divinity, which gave His word inherent impressiveness and made men listen with respect. He taught "As one that had authority and not as the scribes."

But this was not all. Even divinity itself must obey fundamental laws to succeed in any calling. The teaching of the Savior is no exception to the rule. It exemplifies the basic principles on which all teaching must be founded to be successful.

The steps to a successful Sunday school teacher must follow are in part at least the following: These were practiced by the Master:

1. He had a true love for God and God's children.
2. He had a burning belief in His mission to serve and save mankind.
3. He had a clear and sympathetic understanding of human beings and their vital needs.
. He was a constant, earnest student. He knew the "Law and the Prophets." He knew history and the social conditions of His times. (Enlarge compare our times).
5. He could discern truth. He was uncompromising in upholding it.
6. His mastery of language enabled him to reach and hold hearers of every class and condition.
7. His creative skill in portraying lessons made them live for all time. (Illustrate with a parable.)
8. He led folk to "Hunger and Thirst after Righteousness."
9. His teaching inspired in active goodness—a desire to apply the gospel in uplifting service. (Illustrate.)
10. He demonstrated His faith by living it consistently (illustrate) and courageously.

To make our Sunday school front line a solid front line takes work, work and more work. The success depends upon our devotion and work.

No Sunday school can be front line with a backline pastor slothful officers and late teachers.

The pastor is the beacon light by which the officers and teachers are guided.

The important steps in building a front line Sunday school are the steps applied in building a first line Sunday school teachers as the leaders are so will the followers be.

In the words of Henry Wadsworth Longfellow:

"The heights by great men reached and kept
Were not attained in sudden flight
But they while their companions slept
Were toiling upward in the night."

"The Use and Abuse of Church Music'

Subject Discussed at Kansas City Session of the S. S. Congress by Rev. R. E. S. Utterback, Pastor, Calvary Baptist Church, Muncie, Indiana

Church music is one of our most powerful instruments of worship; powerful as such because it is worship. The heart and will of our Heavenly Father are delighted with worship. When the music which is used in Church services is improperly directed, and by that statement I mean dedicated to the wrong persons and purposes, it is definitely an abuse and thereby cannot be worship.

The source of music should be far deeper than tunes effected by manipulation of instruments by use of hands, feet, or mouth. Music to be real must come from the soul; in other words, for music to be real and worshipful and meaningful, the soul of the person or persons must be the instrument upon which the Holy Spirit plays. I believe that three worlds should be stirred, and that three worlds will be stirred, when the right kind of music is used in the House of the Living God. Let God take hold of the heart and mind and tongue of His people, and then let them play or sing as their souls may be inspired by the Holy Spirit, and you will behold God listening from heaven on high; you will behold the devil trembling in hell from beneath; and you will behold men being saved and elevated on earth from between.

God loves music. Just how much God loves music we cannot say, but he always demonstrates himself in the music which he loves. The music which a minister is able to put into a sermon is the power, for the most part, which sets our souls aflame when we hear preaching. We know that God loves music in the fact that when all the vicissitudes of life are over and we get home to our Blessed Master, in the fact that when Jesus the immaculate Lamb and Son of God shall be crowned Lord of lords and King of kings, in the fact that when the glaring, glittering, bright shining instruments which we used down here to praise God shall be laid aside because of having become antiquated and tarnished by the ravages of time and use, in the fact that when we have made the safe voyage from time to glory and our souls reach the limits of the City which Jesus promised to prepare for us, in the fact that when God shall hush the voice of singing angels, in the fact that when four and twenty elders fall down before the Lamb, having every one of them harps and golden vials full of odors, which are the prayers of saints, in the fact that when the Redeemed of God out of very kindred, and tongue, and people, and nation who have been made kings and priests unto our God shall reign on the earth, in the fact that when the song from heaven shall be heard that no man could learn but the hundred and forty and four thousand, which were redeemed from the earth, and then they sing the song of Moses and the Iamb, saying, Great and marvelous are thy works, Lord God Almighty; just and true are thy ways, thou King of saints, then, and then alone shall we see our Father's glory and joy which no eye hath seen, which no ear hath heard, and no heart has had reveled into it, and God himself shll be fully satisfied as he has not been since Adam sinned in the Garden of Eden.

Church music should be used to honor and praise God; it should never be dedicated to man or men. The sense in which men should be affected by music is that there should be aroused within them the realization that they need God, and that they cannot get along without God. Men should be lifted up by church music. Choirs, choruses, solos, duets, and group singing are helpful in all churches. I should think, but church music is abused when it is so arranged that every Christian in a given service is not able to lift up his voice in song in that service We have ragged-timed jazzed-timed, choir-timed, chorus-timed, and group-timed our church music to the extent that it is hardly worthy of being called church music.

Let's sing; let's sing from the soul; let's sing songs which are because of some heart having been inspired; let's sing songs which inspire; let's sing songs which live and make alive. Let's sing, "Praise God, from whom all blessings flow; Praise him, all creatures here below; Praise Him above, ye heavenly host; Praise Father, Son, and Holy Ghost."

"Security is a $4 word!"

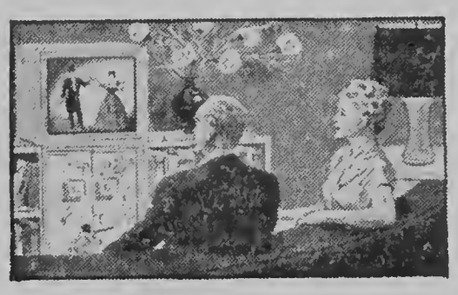
but figuring it out now will save you future headaches

In simple words, "security" means future land purchases, education for your children and a sizeable nest-egg for your later years.

You'll be wise to plan ahead for these by investing all you can (and a little more) in U. S. Security Bonds. This long-range crop is a safe one that is sure to pay you $4 for every $3 . . . in only ten years.

You'll find these savings bonds—quickly convertible into cash—a sure-fire remedy for rainy-day worries.

Ready for College! They reoch thot age before you know it. Then the question is: Are you ready to foot the bill? With a nest-egg of savings bonds you will.



The World on your Farm is what television will bring. Or is it a modern kitchen your wife hos her eye on? U. S. Security Bonds will make your dreams come true.

A Strong America is another form of security you buy with every U. S. Security Bond. Look ohead . . . put o good share of your income now into this long-ronge crop.

U.S. SECURITY BONDS

Buy U.S. SECURITY BONDS

"AMERICA'S SECURITY IS YOUR SECURITY"

Food Goals Press Colored Farmers for Continued High Production

The national farm production goals for 1948, announced recently by Secretary of Agriculture Clinton P. Anderson, call on white and colored farmers for top production not greatly different from wartime farm output.

The goals call for 356 million acres of cultivation and hay crops. The Nation's 700,000 colored farmers will be expected to continue pressing their 30 million acres for a high level of production. Colored farmers will help grow 22 milion acres of cotton, 92 million acres of corn, 16 million acres of sorghums, 60 million acres of hay, 2,359,000 acres of peanuts, 1,552,000 acres of tobacco, 651,000 acres of sweetpotatoes, and 3,870,000 acres of truck crops.

Also, colored farmers will help produce 120 million pounds of milk, 690 million head of chickens, over 100 million head of cattle, and 58 million litters of pigs.

These goals, which are somewhat smaller than the indicated production for this year, are expected to provide for a continued high level of consumption. However, meat production goals call for only enough to provide 143 pounds per person for domestic consumption. This compares with 156 pounds per person this year.

The goals will be studied at meetings of State USDA Councils which include representatives of Federal and State agricultural agencies. The final national goals will be announced shortly after the first of the year.

Protestant Committee On Scouting

Dr. A. E. Iverson the Secretary, Seeking Denominational Data

A Denominational Chart to Convey Concise Information about the Organization and Top Personnel Is To Be Prepared

Interest in scouting and the work of Boy Scouts as it affects the several denominations, is on the increase; especially is this true among the Protestant Committee, headed by Dr. A. E. Iverson at No. 2 Park Avenue, New York. and as is indicated in a letter written under the date of June 21st here in New York, which says:

"Dr. Henry Allen Boyd, Secretary, National Baptist Publishing Board, 523 Second Avenue, North, Nashville, Tennessee — Dear Dr. Boyd: At the annual meeting of our Protestant Committe on Scouting we discussed briefly the idea of preparing a denominational chart to convey concise information about the organization and top personnel of the church for the guidance of Boy Scout Executives all over America. So many requests for such an outline have come from Scout Executives that we must go forward with the idea.

In order that the chart may be accurate we would like to have you fill in the outline for your de nomination. To illustrate what we want I shall use the Protestant Episcopal Church as an example and you will find it illustrated on the second sheet.

In addition to providing data for the outline could we trouble you to secure transcripts of official legislation on Scouting adopted by your Church in convention or by the official boards of the Church. If such action has not been taken could we have a brief statement of the status of Scouting in its relationship to the Church. This information will be published on the reverse side of the chart which will be sent to all Scout Executives in Local Councils, Regions and on the National Staff.

Your valued cooperation in this endeavor will be most heartily appreciated. We are hoping to complete this project by July 10,, and therefore would be grateful for an early reply.

Very cordially yours,
A. E. Iverson, Secretary
Protestant Committee on Scouting"

"The Sunday School Meeting the Needs of The Junior Age"

Mr. O. J. Holmes of Clarksville, Tenn., Discussed Subject at Sunday School Congress in Kansas City.

Greetings, Fellow Christian Workers: I am indeed happy to share in this fine fellowship and to attempt to discuss briefly, "How the Sunday School is Meeting the Needs of the Junior Age."

We know the needs of the Junior Age are many and varied. We are living in an age where it takes all the agencies we can command to encourage, instruct, advise and to admonish our boys and girls. These contribute largely to the moral betterment of our boys and girls and that is certainly one of the needs of the Junior Age.

The Sunday School helps boys and girls to build their religious beliefs and practices upon God with their belief in God. The Sunday School also helps the Junior Age children to develop certain right attitudes. We must grow in our relationship with God as both all powerful and all merciful. A great poet once said,

"As the marsh hen builds her nest
on the watery scd,
So will I buiid my nest on the
goodness of God."

The Sunday school, if we can get boys and girls to attend, will help instill such principles.

Children must develop right attitudes to understand that even in this world of sin, and all manner of evil, they can find refuge, strength and rest in the sunshine and warmth of the goodness of God.

The Sunday school helps us to try to live our best. This is not always easy to do. Sometimes our environments are not the best. It is hard to be filled with sunshine when we are in the midst of shadows, to seek peace when all around us is in confusion, to express love in situations where hatred is so openly expressed.

But this is one great opportunity of the Sunday school, and it can be done if our practices are built upon the one foundation, "I believe in God." Our boys and girls need to be taught to relieve suffering, to help the oppressed, to make the world a better place in which to live, to be tolerant of other people and to be merciful.

We go to Sunday school to learn about God, about the Church and about worship.

The Sunday school meets the needs of the Junior Age by asking this question: Do you **think, do,** and **say** what is right?

Sunday school work urges boys and girls to live accoring to the highest ideals. It seeks to develop in them a righteous character. It stresses worthy life and conduct. While our religious life has its beginning in the home, it grows fuller and richer in the Sunday school and church. Without religious training, one cannot secure a full measure of success.

In conclusion, I wish to state: When one thinks of the Sunday school meeting the needs of the Junior Age, I think of a poem that gives some fine thoughts that can be instilled in boys and girls by regular attendance in Sunday school. I conclude with this poem written by Annie Johnson Flint. She stated and I quote:

"I believe but do I? Am I sure?
Can I trust my trusting to endure?
Can I hope that my belief will last?
Will my hand forever hold Him
fast?
Am I certain I Iam saved from sin?
Do I feel His presence here within?
Do I hear Him tell me that He
cares?
Do I see the answer to my prayers?
Do no fears my confidence assail?

"I believe—yes I do
I believe He will never fail me,
never leave,
I believe He holds me and I know
His strong hand will never let me
go.
Seeing, hearing, feeling,—what are
these?
Given or withheld as He shall
please
I believe in Him and what He saith.
I have faith in Him, not in my
faith,
That may fail tomorrow or today,
Trust may weaken, feeling pass
away
Thoughts grow weary, anxious or
depressed,
I believe in God and there I rest."

Mr. O. J. Holmes,
R. 5, Box 30,
Clarksville, Tennessee.

Three Outstanding Publications To Be Used in Oakland

National Chorister, Rev: H. B. P. Johnson Will Begin His Instructions, Aug. 9th

Once again there will be a chorus organized, trained, coached and ready to render service at the Sixty-eighth Annual Session of the National Baptist Convention of America which opens in the big auditorium in Oakland, California on the morning of September 8th. Rev. H. B. P. Johnson, the chorister, is to arrive in Oakland early on the second Sunday in August, which according to the calendar, will be August 8th. He will immediately begin the organization of his singers. He will classify them according to voices, sopranos, altos, tenors and basses. The fact that he is well qualified to do this work has been demonstrated on more than one occasion. He not only tells people how to sing a song or how to make a note, because it has been proven time and again that if the sopranos are off pitch he can sing soprano, or if the tenors don't do their job, then he shows them how; the same is true with the altos and bass voices.

For the convention this year he has selected the Victory Song Book, a publication with much good music and many fine selections; the Harp of Zion Song Book, and last but not least the Celestial Showers No. 2 Song Book. These have been forwarded by freight to the Rev. Wm. Clark, D. D., the entertaining pastor, and he has selected certain numbers out of the books and sent them on to Mrs. Onie Houston of Los Angeles, who is going to direct the chorus for their State Congress. It was learned in Kansas City from Dr. Clark, Rev. Henderson and others that the chorus would do two jobs, one for the State and one for the nation.

Secretary Boyd declared on his arrival in the city, that he was sending the books much ahead of time because freight is very slow and the distance is great. He said the expense would be too much to send these books by express. All three of them are publications from the National Baptist Publishing Board. There are many songs in these three books, declared Secretary Boyd, that have never been worked out, never been used, but they will be using the newest ones and among the best during the Convention session next September.

It is also expected that there will be a Pre-Convention Concert on Tuesday night, Sept. 7th, but whether it will be in the Mt. Zion Church or the city auditorium, has not yet been determined. All of this is waiting instructions from Oakland and from Rev. Prof. Johnson in his home at New Orleans, La.

THE BYRD NEST

By Rev. Bernard O. Byrd —Guest Columnist

SUSTAIN SECURITY BY WATCHING DETAILS

Ae we further consider the vision of the Ram and the Goat which Daniel explains in his writings, we should not overlook the fact that the tragedy of the Medes and the Persians possibly resulted from a growing dislike among the Grecians. It is true that a coal of dislike may be fanned into a mighty flame of resistance and destruction. The actions and power of Medo-Persia must have had some bearing upon the preparation and vicious attacks made by the Grecians ---While all details are not on hand, it is possible that the dealings of the Medo-Persian leaders failed to make friends with the conquered nations and the sister nations around about them. Such a failure may easily lead to a growth of dislike and desire for destruction. One might learn that today while men may have positions of authority they should learn that they may drive away from them members or they may draw the members to themselves. Presiding officers who deal roughly with the members of the organiation, do not help their own situations of security. Even when a presiding officer is right in his deliberations, he should take much care to cause people to love him even though a ruling may be against them.

Generally when an animal is used to represent some person or nation, the characteristics of the animal in some way are similar to those of the thing he represents. We are not always to consider all the characteristics of the goat family we may see why one should learn a lesson of watchfulness in viewing the approach of the goat. Notice that there are many types of goats that in order to know one from the other it is necessry to watch thir actions. Should not this information cause a church-worker of today to be careful to know people today by the things they do. There are some general characteristics which may be seen in all goats, but there are some special things which distinguish each species. In the church-work, we see quite a number of church-mmbers who vary in their characteristics. It is impossible to know a person except by the things he does.

The presence of the goat is very uncomfortable because of his extreme odor. People passing by can know that a goat is near without seeing him; the smell tells. While we may not refer to people in such ways since mankind is generally advanced in acts of cleanliness, but we do know that the conversations and tempters of many persons often make people's presence uncomfortable. It perhaps has been the experience of many of the readers that the presence of some people make things uncomfortable because one never knows what vulgar, discourteous, or insulting word is likely to be spoken. Sometimes we are uncomfortable because of the actions of resentment even to the better things of life. Many people are like untrained or undisciplined children whose parents give special instruction for the time of visitors but which parents are always unnerved, fearing that something shameful will be done. Watch the goats among your associates.

Another character of the goat which helps one to value watchfulness, is the fact that a goat can go almost anywhere. He climbs fences gets on the tops of small buildings, he climbs up steep cliffs, and even walks fences. This certainly would remind a conscientious Christian that satan has his followers so qualified that they are able to get into anything wherever decent men In our churches we have goats in in the pulpits, on our deaconboards, among our trustees, as presidents and superintendents, and in other official capacities. If the place is steep he can climb in. To be secure, watch the man who gets into everything that goes on.

One other character which deserves at least a brief mention is that the goat often runs with sheep in the day time, but separate themselves at night. They are like the church members who run with the Christians in the day or in the church activities, but resort to different places when such services and works are ended. Notice also that even when unmolested by others, the goat strikes without a warning. Such was the actions of Greece, and such are the actions of the present day dangerous goats among the sheep of the fold of Christ. To be secure, watch the details of their actions.

Home Mission Board's Order

Dr. I. M. Hendon, Cor. Sec'y., Issues Lessons And Catechisms for Coming Nat'l. Convention

An order has been placed with the National Baptist Publishing Board of the National Baptist Convention of America, by the Rev. I. M. Hendon, D. D., secretary of the Home Mission Board of the same convention, of which Rev. J. H. L. Smith, D. D., is the chairman. It is to consist of one thousand Bible Lessons, which treats on the subject of Home Missions and which contains the Articles of Incorporation and By-Laws of the Home Mission Board, and one thousand copies of the Catechisms on Missions as it relates to pastors, churches, auxiliaries and their leaders. The order came more than a week ago directly from Chicago, and the secretary of the Board says he has asked Rev. Henry A. Boyd to rush this order to completion, sending a part of it to Chicago and the remainder to Oakland, Calif.

This is the first installment of denominational work from the various secretaries of Boards to be sent to the National Baptist Publishing Board for this convention year, except the National Convention Minutes. Each of the Boards in the convention is due to make its report. but all of them do not have a printed report. However, those that are to print their reports are expected to send them in to the Publishing Board, giving them time to execute the job before the convention convenes in Oakland, Calif.

Among the printed reports that will be made before the Convention is one of the Home Mission Board of Chicago, the National Baptist Publishing Board in Nashville, the Foreign Mission Board in Columbia, S C. It was not definitely known here this past week whether the President's Address would be in printed form, and whether the B. Y. P. U. Board, the Benefit Board, the Evangelical Board, the Woman's Auxiliary and the Junior Women would have their reports in printed or pamphlet form to hand out to the messengers during the convention week.

All Hands in the Field Both Hands on the Plow

The essential security for a peaceful nation. 'Blessed is the nation whose God is the Lord. This is something for the human race to know. You cannot talk brotherhood, and act jim crow. The law of security is the law of God. The law of God is the law of love. It has no special respect for color; just love God and one another. All hands in the field; both hands on the ploy, and all the plows going.

By the writer of the ALABAMA PAGE of the National Baptist UNION-REVIEW—J. W. J.

WOMAN'S PAGE

To the King's Taste

By Hoyt Alden
Proper Handling of a Fine Ham Is American Contribution to Art

One of the great contributions to international cookery has been made by Americans in the proper handling of a fine ham. Without borrowing from foreign cuisine, we have developed unsurpassed recipes in his field.

The work has been done principally by men, from the first farmer who learned by trial and error how to smoke a handsome ham, down to the experimenters who are famous for those tenderized numbers and the excellent whole hams that are sealed in cans. Even the fancy chefs who cooked hams in paper were preceded by the plainsmen who laid the ground work for all their recipes. In the early days in the country, hams were plentiful and good, so the pioneers got busy trying to find out how to cook them. Their crude efforts were gradually developed and, years ago, the sincere eaters of the western states had a ham that ranked high among the best. It was ham cooked in paper, like this:

Stick holes in the skin of a fine ham with an ice pick. Put cloves in these holes. Mix garlic and salad oil and rub the skin side thoroughly. Rub the other side with brown sugar. Take some butcher's brown paper, dampen it slightly and wrap the ham. Give it a second wrapping and close up all the cracks with paste made of flour and water. Tie with wire so that it can be lifted with a pole and hook, as this should really be cooked in a pit as it was many years ago. However, it can be baked in a slow oven. When done all the escaping juices will be in the paper ready to be poured onto a platter and there is nothing that tastes better. This was a hangover from the days when the cowboys rolled a ham or a bull's head in clay and buried it in a bed of live coals.

Today the Little Woman's idea of a ham to give it a fast brush with some brown sugar, stick it with a few cloves and sock it into the oven, from which it eventually emerges dry and scraggly or underdone. Knowing nothing about the virtues of various juices --pincapple, apricot, etc.--she invariably fails to preserve the natural juciness of the ham. It all cooks away while she isn't looking.

Likewise a smoked ham seems to baffle most cooks who encounter it. The first course in the handling of a smoked ham is to dunk it in a kettle of cold water and soak it overnight. Next put into a boiler with plenty of water and bring it to a boiling point and simmer it slowly--about 30 minutes to the pound. Let it cook, then remove the skin. Now you are ready to bake it and there are any number of ways to do your stuff.

Down in Tennessee they take a ham treated as above. drain it and wipe it thoroughly. Next they mix a quart of corn meal, a tablespoon of pepper and a cup of brown sugar, adding enough cold water to make a paste that will spread. Cover the ham with the paste, which should be at least a half inch thick and bake for three or four hours, adding a little water to the pan. Remove. peel off the paste and the skin, cover it with crumbs and stick it back into the oven until it is golden brown.

Another system from thereabouts involves boiling the country ham in water with a teaspoon of cloves, a teaspoon of peppercorns, a handful of greens goods, such as turnip tops, spinach or the like, plus a cup of molasses and some chopped up onion. Let it cook in the liquid. Remove the skin rub it well with brown sugar and pepper and bake it until it is well done. Baste it from time to time with some of the cooking liquor which a little sherry has been added.

Even the fancy chefs have contributed something to the best of the American methods of ham cookery. This one was devised by a New York chef of international reputation:

Soak the ham overnight. Put it on to boil in water to which a pound of brown sugar and six green cut-up apples have been added. Boil it very slowly, for from two to three hours depending on size. Remove from the stock, trim off the skin and excess fat and remove the bone. Now make a mixture, just thin enough to pour, of brown sugar, liquid mustard and sherry wine. Pour this over the ham and bake in a moderate oven for half an hour, basting now and then. It's something

---

A friend of mine who fancies himself as a ham cook, puts thick slices in a pan. As it cooks he adds, little by little, milk or cream which is absorbed. He keeps adding the liquid until the ham is done, then he sits down and eats it for breakfast. You can cut it with a tennis racquet.

PECAN PUDDING

Beat until thick 3 eggs. Mix in 1 cup dark corn syrup, 1-2 cup sugar and 2 tablespoons melted butter. Sift together 1-2 cup cake flour and 1-8 teaspoon cream of tartar. Fold into egg mixture with 1-2 cup pecan meats and I teaspoon vanilla. Pour into greased baking dish. Sprinkle over top another 1-2 cup pecan meats.

Bake at 375 degrees for 35 to 40 minutes, until top springs back when touched with fingertip. This has cake texture on top and pudding beneath. Cut into wedges and serve cold with whipped cream.

Once tarnish covers the surface of copper it provides further oxidation. If it is removed a thin film of the copper goes with it. Unless a lacquer is applied, the tarnish soon forms again.

FRUIT COMPOTE

Bananas are delectable coupled with canned diced pineapple. The pineapple juice will prevent them from turning brown. Orange segments that are free of membrane are good added to this combination, too.

To crust intended for apple pie, add about one-half cup of grated cheese.

HERE'S ANOTHER RECIPE: TRY THIS BREAD

By MRS. AUBREY HINTON

Do you ever get hungry for the "good old yeast rising bread" —the kind mother used to bake? I do.

I never attempt to bake this type of bread without remembering the time and flour I wasted years ago before I realized it was essential to follow the recipe closely. It's surely a "cook's delight" that can't be rushed to completion.

It's best to start out just before bedtime or early in the morning.

The recipe:

One yeast cake, one quart luke warm water. Dissolve yeast in water and add one tablespoon sugar and one teaspoon salt. Add enough flour to make a stiff dough. Kneed until it is like stiff biscuit dough.

Place in a gallon container and set where it will keep warm. Let rise until the size is doubled. Remove to biscuit board covered with sifted flour and kneed thoroughly--after adding about a tablespoon lard.

Divide into four equal parts and kneed each. Place in well-greased pan, turning over and over so that all sides of the dough is greased. Bake in a moderate oven at about 350 degrees. Bake until bread is a golden brown.

Try it.

SAUSAGE-VEGETABLE CASSEROLE

1 1-2 pounds pork sausage
2 cups cooked or canned lima beans.
2 cups canned corn
1 cup vegetable liquid
2 tablespoons flour
1 teaspoon salt z
1-4 teaspoon pepper

Shape the sausage into patties Brown patties slowly in frying-pan. Combine all remaining ingredients, and pour into greased casserole. Place browned sausage patties on top of vegetables, and bake in moderate oven (350 degrees) for 45 minutes. 6 servings.

Oat flour is found to lend stabilization to frozen desserts, particularly ice milk sherbets.

SPAGHETTI TIMBALES

Half of 9 oz package spaghetti
1 tbsp. chopped onion
2 tbsps. butter
3-4 cup cooked or canned tomatoes
3-4 cup milk
1 egg
3 4 tsp. salt
Pepper
3-4 cup grated American cheese
2 tbsps. flour

Cook unbroken spaghetti in boling salted water until tender. Drain. Line buttered custard cups or individual baking dishes with spaghetti coiled around sides. Cut remaining spaghetti in short lengths. Cook onion in butter over low heat, stirring occasionally, Add the flour and mix well. Add the tomatoes which have been put through a sieve, and cook, stirring constantly until thickenend. Remove from heat and add the milk and slightly beaten egg gradually, stirring constantly. Add salt, pepper cheese and remaining saghetti. Pour into lined cups and place in pan of hot water. Bake in a moderate oven (350 degrees F.) for about 40 minutes, or until set. Unmold and serve plain or with a tomato sauce. Serves six.

If you have spaghetti and left over ham on hand. you are well on your way toward Savory Spaghetti Ring with vegetables. This one dish meal owes its good flavor to diced ham and pickled relish. Hot buttered new carrots and peas fill the center of the ring.

SAVORY SPAGHETTI RING

1 tbsp. salt
3 qts. boiling water
6 oz. long spaghetti
3 tbsps. butter or margarine
v tbsps. enriched flour
1 cup milk
3 tbsps. Salt
1-4 tsp. pepper
2 tbsps. chopped onion
2 tbsps Chopped pimiento
2 tbsps. chopped green pepper
2 tbsps. pickle relish
1 cup diced cooked ham or canned luncheon meat
2 1-2 cups cooked peas, drained
1-4 cup butter or margarine
1 cup cooked carrots

Add tablespoon of salt to actively boiling water. Gradually add spaghetti and cook until tender (about 12 minutes). Drain and rinse. While spaghetti is cooking, melt butter or margarine in top of double boiler. Stir in flour. Gradually add milk, stirring until thickened. Add salt, pepper, onion, pimiento, green pepper, pickle relish, ham or luncheon meat. Blend well. Fold in spaghetti. Pour into greased 9-inch ring mold. Set in pan of hot water and bake in moderate oven (350 degrees F.) one hour. Unmold on hot platter and fill center with hot buttered peas and carrots. Serves six.

The orrange bread on today's supper menu is so downright good that it needs no other recommendation. However, you will find it a welcome change at several meals. Toasted with butter, for breakfast--serve orange marmalade, too-- it is an early morning treat. It gocs well with a spring salad at luncheon, and spread with softened cream cheese it makes a wonderful accompaniment for tea.

Instead of dampening your clothing in a hit or miss way, lay pieces out flat and dampen one section at a time.

Never dry wet clothcs on radiators as the radiators will not be able to function properly when covered.

After washing, hang play trousers, corduroys, etc. by the cuffs to line to keep edges even. This avoids dog-eared corners.

TODAY'S TIP ON FOOD SAVING FOR HOMEMAKERS

Dried fruits are in good supply. Prunes and other dried fruits are delicious cooked until tender, chilled, and stuffed with cottage cheese, peanut butter, or grated raw carrots and used in a salad with salad greens and dressing.

--Citizens Food Commiteee

Plan to include in your meals every day a green or yellow vegetable -- some raw, some cooked (frozen, fresh or canned).

Don't overcook cabbage -- save its color, flavor, and food value by cooking, tightly covered, in only enough water to keep from burning. Cook cabbage only until it is tender-crisp -- about eight minutes for shredded cabbage and fifteen minutes for wedges.

Don't pour down the drain the food and flavor in the liquid from cooked vegetables. In cooking vegetables, use just enough water to keep them from scorching, and serve the little that remains with the vegetables.

BISHOP'S DATE CAKE

1 cup dates, pitted and cut into small pieces (about 26)
1 cup chopped walnut meats
1 3 cup butter or any good shortening
1 cup sugar
4 eggs separated
1 1-4 cups cake flour, sifted
2 1-2 teaspoons baking powder
1-4 teaspoon salt

Pit the dates and, with warm scissors or a knife, cut them into small pieces. Chop the walnut meats. Cream the butter with the sugar. Add the egg yolks and beat very hard. Sift the cake flour, measure and sift again with the baking powder and salt. Add to the first mixture with the dates and nuts. Mix thoroughly, being certain that the dates and nuts are coated with the flour before beating. Fold in the stiffly beaten egg whites. Mix thoroughly but gently. Turn into a very generously buttered ring mold or a loaf pan. Bake in a moderate oven (325 degrees) for about 50 minutes or until nicely done. This lovely litlle cake requires no frosting.

PRUNE-CARROT SALAD

1 1-2 cups cooked prunes
2 cups shredded raw carrots
French dressing
Lettuce

Slit prunes down one side and remove pits. Cut prunes in thin slices. Combine with carrots and mix with French dressing. Serves 4 to 6.

SPAGHETTI PORKIES

1 tbsp. salt
3 qts. boiling water
6 ozs. spaghetti
1-4 cup diced green pepper
1 1-2 cups medium white sauce
1 cup cooked sliced carrots
1 tsp. salt
12 pork links

Add salt to actively boiling water. Gradually add spaghetti and continue boiling until spaghetti is tender (about 12 minutes) Drain and rinse spaghetti. While spaghetti is cooking, partially cook pork links (about 8 minutes). Combine white sauce, greeen pepper, carots,, salt and spaghetti Pour into greashed quart baking dish. Arrange por links on spaghetti. Bake in moderate oven (350 degrees F.) about 20 minutes.

A meal in itself, hearty with vitamins and minerals, is the old Italian favorite, minestrone. The soup itself is a harmony of vegetable flavors, and the addition of noodles gives it a filling, energy-sustaining quality which makes it a wise and thrifty dish. A knuckle soup bone, rich in flavor, is used as the basis of the broth, and bright carrots, parsley, cabbage and tomatoes all blend into a soup any gourmet would relish. Some housewives prefer to use four boullion cubes or an equivalent amount of meat concentrate and two quarts of water in place of the soup bone and three quarts of water called for in the recipe, but this is a matter of convenience or personal preference.

Minestrone

1 pound knuckle soup bone
3 quarts cold water
1 tbsp. salt
1 1-2 cup navy beans
2 tbsps. olive or salad oil
1 clove garlic, sliced
2 tbsps. chopped onion
2 tbsps. chopped parsley
1-2 cup salt
1-8 tsp. pepper
1 cup finely chopped cabbage
1-2 cup diced carrots
1-2 cup tomato puree
1-2 cup very fine noodles
Grated Parmesan cheese

Place soup bean in large kettle. Add water, I tablespoon salt and beans. Cover and bring to a boil. Skim. Recover and simmer four hours. Heat oil in skillet and brown garlic in it. Remove garlic and add onion and parsley and cook until tender, about 3 minutes. Remove bone and meat from meat stock. Add 1 2 teaspoon salt, pepper, onion, parsley, celery, cabbage, carrots and tomatoes to meat stock. Cover and simmer for 30 minutes. Add noodles and cook 8 minutes longer. Serve hot in soup bowls with cheese sprinkled over the top. Yield: 2 quarts soup.

If carrots are cut julienne fashion, in long thin strips, before cooking they add an attractive note to a vegetable plate.

A delicious stuffing for mushrooms can be concocted from buttered fine breadcrumbs mixed with devil ham.

BRUSH CARE

Here are some tips from experts on how to prolong the life of good brushes:

Always hold a hairbrush by the handle without touching the bristles; wash in tepid soapy water not soda: don't dry it in the hot sun nor in strong artificial heat.

Nail brushes should not be placed in boiling water, should moisten the bread crumb and liver sausage combination. Stuff into peppers and continue cooking in the oven. This stuffing is also good for tomatoes, onions and cabbae leaves.

Salt will help you rid your hands of fish odor. Rub your hands with slightly damp salt and run it under hot water.

Watermelon Farmer Discovers More Profitable Production Methods

Raleigh Merchants Bureau Sponsors Local Corn Contest

Raleigh, N. C.—The Raleigh Merchants' Bureau has announced its sponsorship of the Wake County Negro Corn Growing Contest for 1948, says W. C. Davenport, Negro County Agent of the State College Extension Service.

The announcement was made here recently by Ben. W. Haigh, Chairman of the Agricultural Committee, with $100 being set up for 4-H and adult prizes. When broken down the prizes run, adult: 1st. $20; 2nd, $10; 3rd, 4th, 5th and 6th, $5 each; 4-H: 1st, $20; 2nd, $10; 3rd, 4th, 5th and 6th, $5 each.

The committee expressed a great deal of interest in the success of the Negro Contest having gone on previously. Particular reference was made to the Corn Program of 1947 with its 86 adults and 44 4-H Club Members competing, of which 7 became eligible to join the Nation's Exclusive "100 Bushel Corn Club." W. D. Pegram, Route 1, Varina, was crowned ADULT CORN KING after growing 123.7 bushels on one acre and Robert Penix, 4-H Club Boy of Route 3, Raleigh, was crowned 4-H CLUB KING after growing 101.1 bushels on one acre.

Already, 238 Negro farmers and 4-H Club Members have signed up for Wake County's "200 Bushel Corn Club" for 1948.

Other members of the Merchants' Bureau Agricultural Committee are L. Y. Ballentine, M. C. Miller, W. D. Martin, G. C. Scarlette, Sam Young, Sr., W. L. Wyatt, Jr., John Alexander, Lyman Kiser, Clyde Cooper, E. B. Haynes, Harold L. Pitser, James D. Ray, Jr., and G. Wesley Williams, Executive Secretary of the Bureau.

Negro Minister Appointed PMA Collaborator in Arkansas

The Rev. Vincent M. Townsend, presiding elder of an Ark., district of the African Methodist Episcopal church, has been appointed a collaborator by the Production and Marketing Administration of the U. S. Department of Agriculture.

His duties, which will be on a part time basis, will include working with rural ministers and Sunday School superintendents in Arkansas as a means of keeping the farm people informed of the need for carrying out sound soil conservation practices.

English Cow Produces 198 Pounds of Milk in Day—Without Beer

R. A. Pierson of Ringwood, England, who last fall claimed a world production record for his Holstein-Friesian cow which produced 155 pounds in 24 hours, has another cow in his herd with a large record.

This cow recently produced 198 pounds of milk in a single day.

The first record was made by allowing the animal to drink a small amount of beer daily. The recent record made without the use of stimulant, the owner said.

Negro Farm And Home Agents Assn. of N. E. North Carolina Met In May

NEW YORK STATE COLLEGE SEP 9 1948 AGRICULTURE

Winton, N. C.—The first regular meeting of the Negro Farm and Home Agents Association of Northeastern North Carolina was held at the C. S. Brown High School, Winton, North Carolina, Tuesday, May 25, 1948. Officers elected to lead this newly formed organization included: M. W. Coleman, Bertie County, Chairman and Mrs. Vivian Morris, Beaufort County, Co-chairman, Miss Clara O. York, Hertford County, Secretary, Miss Helen Wade, Wilson County, Assistant Secretary, Dennis Dupree, Pitt County, Treasurer, C. W. Foster, Wilson County, Parliamentarian and Melvin L. Johnson, Hertford County, Reporter.

In setting up such an organization the newly elected President M. W. Coleman, stated that he hoped such an organization would bring about better working condition and relationships between all Extension personnel and at the same time place agents in a better position to render useful service to the people they serve.

The following committees were appointed: Program Committee, D. J. Knight, Halifax County, Chairman: Constitution Committee, E. W. Goodrum, Northampton County, Chairman: Finance Committee, Miss Ruth Whitworth, Halifax County, Chairman; 4-H Club State and District Committee, R. M. Edwards, Martin County, Chairman.

The Executive Committee was authorized to investigate the possibilities and make the necessary arrangements for an educational tour to the Beltsville Experiment Station, Beltsville, Maryland sometimes during the late summer or early fall.

R. A. Hall, President of the State organization was present to assist with the organization procedures. Mr. Hall stated that he felt such an organization, "should prove helpful to the Extension Program, by carefully studying our problems and making necessary recommendations to the administrative authorities as to how adjustments could be made."

Counties in the Northeastern District include. Bertie, Beaufort, Gates Halifax, Hertford, Chowan,

Checking the Growth of Melons

County Agent Leonidas Watson (second from left) checks the growth of melons on Dan Bennett's farm near Navasota, Texas. His melons are usually three times the size of these when he offers them for sale in early June. Bennett and his nephew, Mason H. Johnson, (extreme left) Compare two growing melons. District Agent H. S. Estelle (right) looks on. Last year Bennett shipped 11 carloads of melons.—USDA Photo.

Dan Bennett Of Navasota, Texas, Passes On His Knowledge To Others

Navasota, Texas.—Dan Bennett, colored farmer of Navasota, Texas, has discovered a new method of growing watermelons through which he has grossed nearly $25,000 during the last five years, reports W. C. David, Texas State leader of Negro agricultural extension work.

Getting into watermelon production as a sharecropper in 1941, Farmer Bennett has now become through the development of his novel seed treatment method, one of the outstanding melon growers of Texas. Annually, he ships from eight to twelve carloads of top grade melons.

Until six years ago, Farmer Bennett had never thought of growing melons as a commercial crop. He was satisfied to grow a few to eat in the field during plowing and cotton chopping time, and on Sunday after church, but that was all; cotton was his crop. He was 49 then and had been growing cotton all his life.

However, as Farmer Bennett began to look around his farm, he saw that his house was badly in need of repair, his barn was just about falling down, and his workstock had dwindled to one solitary mule. With his cotton yield small and the price none too good, he just didn't have the money to make the necessary repairs on his home and barn.

Of course, for years County Agent Leonidas Watson had been trying to get him and the other farmers in his community to diversify. A few were trying it. Some were raising hogs, chickens, turkeys, and cucumbers for the Houston market; and others were growing melons, shipping them to northern markets, but Bennett stuck to cotton.

Then one day in 1941, a white

Rural Areas Show Decline In Enrollment Of Children in School

Washington, D. C.— Enrollment of children in school, for all age groups, is lowest in rural-farm areas, and farm dwellers are getting less education than city dwellers, it is revealed by the National Education Association.

Federal-aid-to-education legislation, now pending in the 80th Congress, would tend to equalize educational opportunities, the report asserts. The 1940 census shows that city residents over 25 years of age average 8.7 years of education, while rural farm people get only 7.7 years.

Although, on the basis of these figures, it is pointed out, the average educational level of the coun-

Older Youth Club Members Turned Out In Large Numbers To Support "Clean Up" Tour

Older Youth Club members of the New Hill Club turned out strong in support of their community Clean-Up, Paint-Up tour yesterday (Friday, May 14).

The tour got off to a start at 9:30 a. m., at the home of Annie Burnett. There the group observed with interest a clean yard free from rubbish, and the indoors equally as clean with furniture well arranged. Annie took pride in telling how she enjoyed making her contribution to the Clean-

Singing Groups To Share In $10,000 Prize Awards

Long Island, N. Y.—Vocal quartettes, trios, choral and other singing groups, unattached or affiliated with churches schools, religious and fraternal organizations are invited to participate in the 1948-1949 National Music Festival to be held in New York's Madison Square Garden. Awards totaling $10,000.00 will be distributed among the final prizewinning groups of two classifications: (1) Spirituals, Jubilee, Camp-meeting, (2) Folk Songs, Semi-Classics, popular.

The gigantic project will be conducted by the newly-founded National Music Festival Society, with funds provided by Moe Gale, nationally famed menter of Ella Fitzgerald, The Ink Spots and other famous stars including the Golden Gate Quartette, who originally conceived the plan to bring talented singing groups into national prominence, and to further the cause of interracial good-will and fellowship by beaming the spotlight of publicity on spirituals, folk songs, camp-meeting and jubilees, America's only original music.

Commencing in early fall, a series of preliminary elimination concerts will be held in churches and auditoriums throughout the south, southwest, to be sponsored by churches, schools, religious, educational, fraternal organizations, civic, cultural and welfare groups, with the entire profits to be retained by them for local charity and welfare work.

Following completion of local preliminaries, sectional finals will

Wasted Fuel

A fuel which has some 20,000 uses, and which is capable of substantially relieving the strain on our fuel oil facilities, is largely going to waste. That little-known fact is the subject of a recent article by James E. Pew of the Sun Oil Company.

The fuel is natural gas. Due to economic and political factors which are beyond the control of producers, Mr. Pew states, about 41 per cent of all the gas that is produced with crude oil in this country is now wasted.

The reasons for this are various. Most important has been the attitude of the Federal Power Commission. It has followed a policy of such rigid control that time after time there have been interminable and costly delays in approving agreements for the sale of the gas, even though both buyer and seller were willing. Further, the FPC has insisted on such low prices for gas at the well-head that in many instances it has discouraged the production of gas for market, and has made it economically impossible for drillers to search for new sources.

This propounds two very important questions. Why, save in time of war, should any government agency have the authority to block the transportation and use of natural gas for any legitimate purpose? And why should not the owners of natural gas reserves be permitted to have their gas transported to market where it may compete on a fair basis with other fuels? A wider use of natural gas in industry, according to Mr. Pew would save hundreds of millions of barrels of fuel oil for conversion into other products. In this day, when there is a ready and expanding market for every form of energy, all should be utilized to the limit.

Soil Erosion Linked With Ills of War

The two things which could destroy our American way of life and eventually destroy civilization are war and soil erosion, J. W. Sargent, assistant regional conservationist of the U. S. Soil Conservation Service recently told members of the Nashville Farmers' Club.

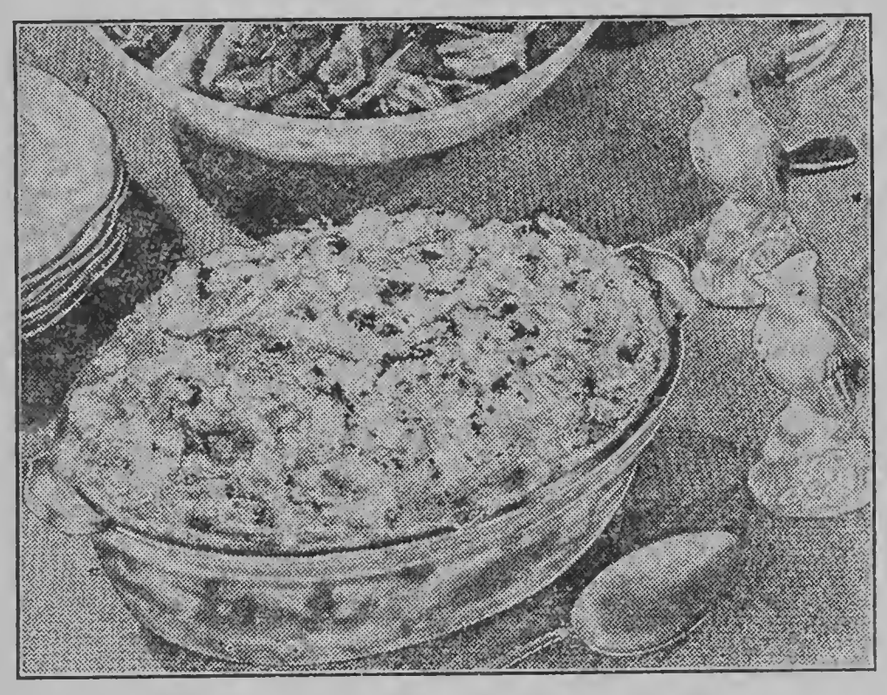
"There are only two major things which can destroy civilization and they are total war and total soll erosion,"" Sargent said. "War, of course is a more rapid agent of destruction, but soil erosion is just as effective and dangerous."

Sargent said, soil erosion is not only the concern of farm people, but of the entire nation and the world. "No country can progress unless its natural resources exceed its needs." he added.

Much of the natural fertility of our soil has been exploited and unless more emphasis is placed on the importance of soil management, those who come after us are sure to suffer, he explained.

Sargent said we are headed in the right direction now with our many soil conservation techniques, but only with the continuous effort of all can we attain our goal of eliminating soil erosion.

Dry Skim Milk Adds a Nourishing Note To a Favorite Dinner Dish



LIKE the birds in the old nursery rhyme — *when the pie was opened the birds began to sing*— your family will sing the praises of this new and nourishing variation of an old favorite—Shepherd's Pie. Made with sweet potatoes instead of white, with beef or pork liver instead of the usual left-over lamb roast, and with protein-rich dry skim milk, it's packed with extra nourishment at little extra cost.

Sweet potatoes, you know, are more nourishing than white; beef or pork liver, more nourishing than the lamb roast, and even than their higher-priced relative, calves' liver. And the two—"sweets" and liver—make a delicious combination.

As for dry skim milk—skim milk in powder form—why, it has all the food and flavor values of fresh whole milk minus the cream, which is poured off before the milk is dried and packaged.

A pound package of dry skim milk, mixed with water, makes five quarts of liquid skim milk, costiug only a few cents a quart.

Packaged dry, in a protecting carton, it can be kept—without refrigeration—on your kitchen shelf, along with other dry foods—salt, sugar, flour and so on.

It can be used dry, too, just as it comes from the package, or mixed with water to make liquid skim milk

Try dry skim milk in your own dinner-in-a-dish casseroles that call for milk, and in this tasty

Shepherd's Pie

- 2 cups mashed sweet potato (or white potato)*
- 2 cups chopped cooked liver or other meat
- 1 cup diced cooked carrots*
- 3 tablespoons fat
- 2 tablespoons flour
- 8 tablespoons dry skim milk
- 1-1/2 teaspoon salt
- 1/8 teaspoon pepper
- 1 cup water from potato and carrots
- 1 large onion

*Save potato and carrot water

Use left-over potato, meat and carrots, or prepare them ahead of time.

Next, melt 2 tablespoons fat. Remove from heat. Mix flour, 4 tablespoons of the dry skim milk, salt and pepper. Blend into fat. Gradually add potato and carrot water Mix well. Cook over low heat, stirring constantly until thickened.

Beat remaining dry skim milk (4 tablespoons) into mashed potatoes. Line greased baking dish with 1 cup of the potatoes. Spread a layer of the liver over the potato, then a layer of the carrots and minced onions. Cover with sauce. Spread remaining cup of potatoes over creamed mixture. Dot top with remaining fat. Bake in moderate oven (350°F.) 20-25 minutes or until delicately browned and thoroughly heated through. Makes 6 servings.

Insured Farm Mortgages

SOUND INVESTMENT FOR LENDERS

Of Interest to Lenders

Private Lenders may now make the farm purchase, enlargement, and development loans in the Farm Ownership program of the Farmers Home Administration. Mortgages will be insured by the Federal Government under the terms of Public Law, 731, 79th Congress.

These Insured Farm Martgages are simple to handle and provide a means whereby private lenders can develop new business and broaden their services to their community.

The Farm Ownership Program is designed to enable farm tenants, sharecroppers, and farm laborers to buy and operate family-type farms of their own, and to enable owners of undersized and undeveloped farms to create adequate family farm units. Loans are mde only to applicants who are unable to get the necessary credit at the rates (but not more than 5 percent interest) and terms prevailing in their locality. Veterans have preference for all loans.

The Purpose of Mortgage Insurance is to extend the benefits of this program to larger numbers and encourage private enterprise to make the loans, thereby reducing the amount of public funds required to achieve the objectives of the Bankhead-Jones Farm Tenant Act of 1937 Originally under that Act, only direct Government loan funds could be used.

FARM MORTGAGE INSURANCE

How It Works

What It Is

Banks, insurance companies, and other financial institutions or individuals may participate in the insured farm mortgage program. Moreover, the legislation authorizing the program amends the Federal Reserv Act to make the insured farm mortgages eligible as investments for National banks.

Following is a description of the way the program is set up and the way it operates.

Authority

The authority for the insured farm mortgage program is contained in the Farmers Home Administration Act of 1946 (Public Law 731), which amends the Bankhead-Jones Farm Tenant Act. A revolving insurance fund has been established from which claims in fulfilling the insurance provisions of the Act are met. Not more than $100,000,000 of mortgage-principal obligations can be insured in any one fiscal year.

Security

Insured farm mortgages are sound investments since they are fully guaranteed by the Government

Each insured mortgage loan is based upon a normal earning capacity appraisal of the farm made by a Federal appraiser, and must be certified by the Farmers Home Administration County Committee (made up of three local persons, at least two of them farmers). The Committee also considers the qualifications of applicants and certifies as to their eligibility. Insured loans can be made for not more than 90 percent of the applicants' total investment in the land and improvements.

To protect the Government's interests, the Farmers Home Administration helps each borrower to develop sound methods of operation. Insofar as possible supervision is provided to assure liklihood of success and the repayment of the loan.

Stability of Return

The interest return to the lender is 7 1-2 percent on the unpaid principal. The borrower pays annually an additional 1 percent mortgage insurance charge to the Farmers Hom Administration, half of which goes for administration and half for the insurance premium.

The cost to lenders in hadling insured mortgages is nominal, as the Farmers Home Administration carries on the functions of processing, collecting, and servicing loans. (See section on Management.)

Principal and interest payments become due annually, but advance payments my be made at the convenience of the borrower. Borrowers may repay their loans on a varisible-payment plan, under which they may make payments ahead of schedule in good years to keep years when they are less able to their loans in good standing in lean pay.

Payments to lenders will be prompt. If a borrower is in default for more than 30 days the Farmers Home Administration will immediately pay the lender all principal and interest due and unpaid. If a borrower is in default for more than 12 months, the Farmers Home Administration will then take over the insured mortgage and pay the lender in cash to the full extent of the unpaid principal obligation and the unpaid interest, plus any authorized payments which have been made by the lender for taxes, etc.

Term

Loans are repayable in 40 years, but refinancing is required by the Farmers Home Administration Act when the borrower is able to obtain a non-insured loan on satisfactory terms at not more than 5 percent interest.

Marketability and Collateral

The mortgages are transferable and assignable upon notice to the Farmers Home Administration.

Lenders can borrow against the mortgages, since they are accepted as collateral for loans by Federal Reserve banks.

Management

From the lender's standpoint, the program is simple in operation and there will be little expense connected with handling the mortgages. The law provides that the Farmers Home Administration shall collect the annual loan charges from the borrower and transmit the portion representing principal and interest to the lender. The lender is promptly notified of any default.

All other loan servicing is carried on by the Farmers Home Administration. This includes the approval of applicants, the appraisal of farms, and necessry supervision of borrowers in aiding them to build a sound and profitable operation. Any work or expense involved in handling delinquencies or foreclosures, if they should occur, is also the responsibility of the Farmers Home Administration.

Lending Procedure

The following steps are taken in making a Farm Ownership loan:

Application Persons who wish to make application for loans should be referred to the Farmers Home Administration office serving the county where they intend to locate. These offices are usually at the county seat and may serve more than one county.

Appraisal A qualified Federal appraiser will appraise the farm to be purchased, enlarged, or improved to determine the normal earning capacity value and other factors pertinent to making a sound loan.

Certification The County Committee then certifies as to the fair and reasoanable value of the farm based on its normal earning capacity, and certifies as to the applicant's reasonable likelihood of success based upon his managerial ability, industry, character, and experience.

Insuring the Mortgge Mortgage insurance on the mortgage will be effective as of the date the loan is closed.

A Successful Record

The Farm Ownership program as authorized by the Bandhead-Jones Farm Tenant Act has been in successful operation since 1937. Federal funds were loaned directly to eligible borrowers. Insured mortgage loans were not made prior to July 1947, but since they are now general policies and procedures as made and serviced under the same general policies and procedures as the direct loans, they should be equally successful.

By the end of the first 10 years nearly 16 percent of all direct loans made were paid in full, and the active borrowers not counting those who had paid up—had repaid 56 percent more in principal and interest than the amount that would be required to keep their loans current on the basis of 40 equal annual installments.

If You Are Interested in Making These Loans

The insured farm mortgage program gives you an opportunity to work with farm families who cannot qualify for regular real estate credit at present, but who are likely to become good customers of local leaders for all of their credit needs in the future. Since brrowers make their owu choice of a lender for an insuraed mortgage loan, it is reasonable to assume that many of the families will want to continue their relationship with the original lender when they become eligible for regular credit.

The Farmers Home Administration will help any interested insured mortgage lender to keep in touch with the needs, plans, and progress of his borrowers in this program. While it is not necessary to the security or handling of an insured mortgage such interest is likely to indicate to the borrower a friendly and understanding source of future credit including refinancing of his loan.

Many borrowers will need chattel and operating loans while they have insured mortgage loans.

When they can arrange with the maker of the insured mortgage loan or other lender for such chattel and operating credit under terms prevailing in the community and consistent with approved plans for the successful operation of the farm, they will be encouraged to make such arrangements.

Maury County Farm Woman

By Lera Knox

We seem to have lost our pet spider. For two years he, she or they have built a gossamer trellis on the north side of our front porch. It must have been a family affair. One spider alone could scarcely have done so much work, nor would he or she have taken so much interest in merely a bacelor apartment or spinster abode.

Often in the evenings just at dusk I have watched the goings in and out, up and down on that beautiful web. And almost every morning especially after a heavy dew or mist of rain, I have marveled at the diamond-like sparkling of the spider domicile.

I didn't plant morning glories or other vines alongside that porch this season, thinking the spider family would take over its decoration. But so far the web has not appeared. Perhaps it is a little too early, or that I am overanxious. Or perhaps my ambitious housekeeper-by-the-day swished away the beginnings of the spider family's annual home with a single stroke of a broom. Or maybe a visiting boy with a tobacco stick "horse" swooped down on what he considered a bandit spider. Or maybe cold weather—who knows?

Every morning I open the front door and search carefully to see if I can discover just one infinitesimal strand of spider web. But so far no luck!

But in the house—that's different. I can look up every morning and see a new web or the beginnings of one in the corner of my bedroom ceiling. I have also discovered a new nest of webs under my kitchen cabinet shelves. I go down into the basement and what should strike me across the bridge of my nose but an unusually strong rope of spider making.

When our new house was being built, windows and doors were hard to get and before we could move in, the spiders took over. They still seem to own and occupy a great deal of the house. I find them under chairs, under tables, and in the closets. The contary critters seem almost human in their stubbornness. They simply will not build that trellis web on the north end of the porch where I con enjoy it. They simply persist in being pesky!

I wonder sometimes if the remote ancesters of some stubborn people I know didn't use to climb about in webs instead of the tree limbs.

Police: "Did you knock down this pedestrian?"

Motorist: "No I pulled up to him, stopped the car so he could cross the street, and he fainted."

It Can Be Done

From the point of view of fire loss, last year was the blackest in American history. The total destruction was about $700,000,000.

At the same time, however, it was a year of progress in fire prevention work. According to the National Board of Fire Underwriters, there was material improvement in the delivery of new fire fighting equipment. The number of cities adopting the Board's model fire prevention ordinance increased by 48 per cent. Many cities made progress in strengthening their building laws. The President's Fire Prevention Conference initiated a long-term program which has been felt to some degree in most of the states. And the Spring Clean-Up Week attracted an unusual degree of cooperation and eliminated many hazards.

It may seem strange that we should have record fire losses along with such intensive prevention work. That simply indicates the extent of the fire danger. The total number of fires has been on the increase, and in these days of high prices the average fire does much more dollar damage than before the war. And due to the building shortage, many homes and businesses are housed in substandard structures where the risks are abnormally great.

Last April was the first time since March, 1944, that monthly losses declined below the same month in any preceding year. If that continues, we will make a dent in fire's ravages. It can be done if we keep the fire prevention campaign going and intensify it.

Make the Oil Go Around

There are differences of opinion as to just what the petroleum supply-demand situation will be next winter. That is natural—the most careful estimates can be thrown out of gear by future, developments which are impossible to anticipate now.

Dr. Robert E. Wilson, chairman of the board of the Standard Oil Company of Indiana and an internationally recognized authority in his field, recently said that 1948 will witness a 5 per cent increase in supplies for domestic consumption. However, he went on, even this may not prevent fuel oil from being scarce in the winter. He then urged three voluntary steps to prevent a shortage:

New oil burner installations should return to the prewar rate.

Consumers should continue to conserve both gasoline and fuel oil.

There must be no serious strikes in oil or other basic industries.

This program is dictated by necessity. The amazing increase in oil burner installations that followed the war has created a growing problem—we simply can't heat the whole country with oil, and other fuels are perfectly satisfactory. Conservation by consumers works no hardship on anyone—vast quantities of fuel are wasted in overheated homes, and through dangerously fast driving. Then, strikes in certain industries—such as coal and steel—could deprive the oil industry of the supplies and production it must have to carry out the expansion program.

There will be no serious oil shortage if we use our heads. It's just a matter of putting our record supply to intelligent use.

Girl Scouts Officials Defy Dixie Hate Mob

New York—Despite the invasion of a Girl Scouts training camp near Bessemer, Ala., on June 11 by a band of masked and robed men, officials of the organization refuse to be intimidated, it was learned this week, when they announced that they would continue to conduct training centers of the kind through out the country.

The camp was ordered broken up by the men after two white women instructors had been searched and told that the residents of the area "don't like Negroes and whites living together." Unpleasant rumors were later circulated about the camp and its occupants all of whom were Negroes except the two instructors.

The stand of the national office was expressed in a resolution adopted by the officers and members of the national executive committee on June 24. The resolution follows:

"It will continue to be the policy of the Girl Scouts ____ to serve all their members regardless of race or creed, and to extend membership as rapidly as possible to all those who wish to join. We shall continue our country-wide program of training adults for leadership and shall provide for this purpose the best available instructors drawn from local groups and the national staff."

Shortly after the incident in Alabama, the national director called on Attorney General Tom Clark to investigate the affair, but no reply has been received from the Justice Department up to this time.

The camp site near Bessemer was rented for the occasion by the Girl Scouts and is not a Girl Scout camp as such. Its invasion by the hooded mob was "completely unwarranted," officials of the organization said this week, and subsequent rumors spread about the occupants "have been carefully checked and found to be totally false.

Overloading the Camel

In the words of Dr. Robert E. Wilson, chairman of the board of Standard Oil Company of Indiana, "oil cannot heat all America." That remark was made in the course of an address designed to bring salesmen of oil burners and the hard-pressed manufacturers of old fuels closer together in understanding.

Last year, the oil industry supplied 20 per cent more fuel than in 1946. It is producing at an all-time high in 1948. This is an achievement which has been universally praised by those who understand oil's problems. Even so, the industry cannot meet a limitless demand for oil for heating purposes.

Since 1918, there has been what Dr. Wilson terms an "amazing increase" in the United States' consumption of energy of all kinds. And oil, unbelievable as it seems, has supplied 95 per cent of that increase. The danger now is that the load may become impossible to carry. Last year, oil burner sales were at a rate of nearly five times the average for the ten years preceding the war, and sale of space heaters expanded to an even greater extent.

The oil burner industry, no less than the oil industry can operate on a sound basis only if it recognizes and acts on current conditions. If and when the Middle East can supply the European market, there may again be plenty of burner fuel in this country—but that possibility is at least three years away. In the meantime, we have an abundance of coal and other fuels suitable for heating. We must not expect oil to do it all.

Four Little Rules

This year, the state and Federal forest services are conducting a drive to prevent forest, woods and range fires, 90 percent of which are caused by human carelessness. Four simple rules have been prepared—and every one of them should be memorized and remembered by people who go into the woods on business or pleasure.

1. Hold your match until it is cold—then pinch it to make sure it's out.

2. Crush out your cigarette, cigar, or pipe ashes. Use the ash tray in your car, and never throw smoking materials from the window.

3. Drown your campfire in water—then stir and drown it again.

4. Make sure you know the law before burning grass, brush, fence rows or trash.

There's nothing in those rules a child cannot understand. There's nothing that will cause anyone trouble or expense. Yet their observance would save for ourselves and our descendents a very large part of the millions of acres of fine timber and grazing land that fire destroys each year—and save with it human and animal life, and the breeding grounds of wild creatures.

In a matter of hours, fire will devastate a forest that represents the work of nature for scores or hundreds of years. It will raze our most beautiful vacation and hunting regions. If you don't want to be the cause of such a fire, follow these fur simple rules of conduct in the outdoors.

New Method of Growing Watermelons

Watermelon Farmer Dan Bennett (center) of Navasota, Texas, shows District Agent H. S. Estelle (left) and County Agent Leonidas Watson how he speeds up the sprouting of his melons by a special seed treatment method. This enables him to get his crop to market early when he will receive a premium price. Bennett is holding a handful of seed from a sack of seed he is about to treat by burying them in a hole and pouring warm water over them every day for a week from the pot at right. Through early marketing, Bennett has grossed nearly $25,000 during the last five years.—USDA Photo.

Where the Money Goes

Every now and then, consumer groups draw an unflattering comparison between the price of beef on the hoof, at wholesale and the price charged for table cuts at retail. The difference is large. And that leads many people to a totally erroneous idea of the costs invlved in processing and marketing.

Some time ago one of the meat packing companies explained, in full detail, where the money goes to. At that time, choice cattle were selling on the Chicago market at an average of 32.5 cents a pound—yet steaks were selling in New York for as high as $1.00 a pound. And here are the reasons why

For a thousand pound steer, the farmer received $325. By the time it was dressed and chilled, that steer weighed only 625 pounds. After adding plant expenses, and deducting the value of by-products, the packer had little more than $307 invested in 625 pounds of beef—which works out to 49 1-4 cents a pound.

By the time the beef reached New York, the packer's cost per pound had risen to 51.9 cents. It was sold to the retailer at around 52 cents, leaving but a fraction of a cent per pound for the packer.

By the time the retailer prepared the beef for sale his investment was over 60 cents a pound. His selling cost, plus a small profit, averaged about 12 1-2 cents. Consequently, all the cuts had to move at an average price of 73 cents for each and every pound. Some of the less desirable cuts had to be sold for as little as 40 cents a pound. And that simply means that the price of the choicest cuts, such as fine steaks, had to approach a dollar.

What is true of meat is true of all staple foods. All along the line, production costs and retailing costs are held to the minimum. Profits are minuscular. And the consumer gets the lowest price possible under today's economic conditions.

ADDS PIQUANCY

Something new and piquant for scrambled or fried eggs. Soak 1 1-2 teaspoon powdered rosemary in 1-4 cup butter or margarine for 15 minutes. Use for scrambling or frying eggs.

Farm Talk with Farm Folk

By Jesse Safley

SCENE: Some dairy farm: Time: Early in 1951.

A dairyman (most any dairyman) awakens to the reality that his herd is showing its age and continues to decline in production.

He's an average dairyman milking a herd composed principally of grade cows which has been profitable for several years—both from the standpoint of milk and calf production.

All through the years he has sold his calves for beef with no thought to the fact that his cows are getting old. That doesn't concern him because beef prices are still good and he can always sell an old cow and buy a young heifer for a very little difference in price.

Replacements never did seem to bother him either. He could have bought some back in 1947 when the prices weren't too out of reason but didn't. Now, he finds himself slowly but surely going out of the dairy business.

This scene will be enacted on Tennessee dairy farms within the next three years if farmers continue to market their fat calves. It is easy to understand why farmers will sell heifers when beef prices are so high, but they are not looking far enough ahead in their program when they continue to send all of them to market.

We have seen and heard of many daily and weekly livestock markets where young dairy animals are passing through by the hundreds on their way to packing houses. No stream will continue to run if it is cut off at the source. The milk flow into Nashville and other markets will not continue unless new blood is continously added to herds.

Some argue that none of the quality animals are going for beef, especially animals from registered herds. Granting that, there would be many going hungry if we depended solely on the registered and quality, bred herds for our milk supply.

The recent extended dry weather has prompted many to sell their young animals "while they are still fat" for wear that feed supplies will be short this winter. We question their wisdom. Any farmer who has the soil should be able to produce all the feed he needs.

There are many supplement crops which can be produced for dry feed. They may not be the best quality, but they could go a long way toward carrying the animals through the winter. A farmer who plans small grain pasture for the fall and winter can feed his livestock on a minimum of dry feed.

Think twice before sending young heifers to market.

Farm Tractor Maintenance Studied by 4-H Leaders

In line with the trend toward increased farm mechanization in the South, one-day tractor maintenance schools are being conducted for Negro adult 4-H leaders reports John W. Mitchell, Extension Service field agent of the U. S. Department of Agriculture.

Within the past several weeks, tractor maintenance schools have been held in Ga, and Ark, under the leadership of Extension Service. Instruction consists of showing 4-H leaders how to operate tractors and keep them in good repair.

The 4-H leaders and Extension Service county agents who attended these schools carried the information they gained at these short-courses back to their local communities. It is expected that this will result in the development of county and community tractor maintenance schools.

Department officials say that farm mechanization may increase sharpely in the South during the next few years. It is estimated that by 1950, there may be nearly a million tractors on farms in the Southern States. The number now stands at about 400,000.

Florida Daily Praises Work of Retiring Extension Leader

A. A. Turner, retiring district agent of the Florida State Extension Service, was praised editorially recently by the Tampa Morning Tribune for his important contribution to agriculture in the State of Florida.

"For 32 years," the editorial began, "a patient, intelligent, forward looking Negro has been working faithfully and loyally to increase and improve the farm output of Florida, particularly with those of his own race."

"Turner started his work in four North Fla., counties," the editorial continued, "and now has the work going in 14 counties. He has carried better home and farm life to thousands of rural Negro families. His research and practical knowledge have brought into Florida production a nember of new crop varieties, including the Puerto Rican yam and a widely known and used brand of cane syrup.

"We speak the thanks of the State, of its people, white and colored, to A. A. Turner who has earned a rest after many years of faithful toil in the vineyard," the editorial concluded.

Turner began work for the Fla., State Extension Service in 1915 and retired on March 1. Upon his retirement, he was presented a length of service award by Extension Service.

Farm Fillers

The U. S. Department of Agriculture suggests backyard rabbit raising as a means of improving the family meals and enlarging the Nation's total meat supply.

Turkey preduction in 1947 amounted to 34,795,000 birds. The average price received for turkeys sold last year was 36.3 cents per lb., as compared with 36.2 cents in 1946.

Construction of a laboratory for intensive gaining research on irrigated cotton has been authorized under the Research and Marketing Act which the U. S. Department of Agriculture administers. The laboratory will be built at the A. and M. college in New Mexico.

Older Youth Club

(Continued from page 1)

Up, Paint-Up Campaign which was the club project for the month of April.

At the home of Eva Evans it was interesting to note how she had bought wall paper and paint and did the job herself by painting ceilings and wood work and hanging wall paper in the living room, bedrooms, hall and kitchen. She also went on to show how she hauled dirt and filled in yard gutters which made the yard shrubbery show up all the more beautiful.

Arriving at the home of Mr. and Mrs. Hezzie Morrison, the followers observed how well the rooms had been painted and walls papered by the young house matron. Mr. and Mrs. Morrison didn't stop on the inside but cleaned their yard and arranged a very attractive wood pile. Also seen was a fine flock of purebred chickens. Great interest was taken in telling the onlookers how the job was done by their own efforts.

Continuing on to the home of Mr. and Mrs. Hazel Lee, a running water system captured a great deal of interest. Also, the result of Mr. and Mrs. Lee's efforts in well painted rooms and chimneys and the arrangement of house furniture which had all to do with making this country home an attractive place. The Lees took time out to show the group their purebred chickens and a young colt bred on their small farm.

When reaching the home of Mrs. Susie Wilson, the group saw an interesting arrangement of a back porch made into a complete kitchen and the addition of a side porch to the house. Mrs. Wilson took great pride in pointing to the job she did in wall papering and the arrangement of kitchen work tables.

With her interest still at high pitch, Mrs. Wilson showed how she had put down a pair of brick steps, white-washed trees on the lawn and arranged the wood pile. Also seen was a well fenced pasture by her brother Nelson.

The tour ended at the Wilson home where lunch was served. The lunch was made possible by the Older Youth Club and community friends.

The tour was planned and directed by W. C. Davenport, Negro county agent, and Natalie Peebles, Assistant Negro Home Agent, both of the State College Extension Service.

Plan Now

To collect eggs twice daily and keep them in cool place during hot weather. Thousands of dollars worth of eggs are lost annually through improper care.

To plant that late garden as soon as there is enough moisture in the soil to germinate the seed.

To save all grasses and legumes (no matter the quality) on the farm for hay.

To send your boy or girl to one of the 4-H Club or Future Farmer of America camps during the summer.

To give brood sows extra attention in order to save more pigs at farrowing time.

Apples Fare Better

Cowiche, Wash.—(UP)—Apples have a better chance of getting to the teacher without bruises these days than they did when dad was a boy. Automatic apple lumpers tested here handle 300 to 500 more boxes a day than was possible by hand and cut bruises 20 to 25 percent.

Cracked eggs should never be sent to market. Such eggs spoil more readily, which means a loss and an unpleasant experience for the house wife who purchases them

Dan Bennett

(Continued from page 1)

neighbor of Bennett's suggested that they grow a crop of melons on halves. He was to furnish he labor and his neighbor was to supply the land, seed, workstock, and tools. Bennett's own 30 acres were being worn out growing cotton, corn and sorghum year after year.

From 15 acres of melons the first year, Farmer Bennett received as his share after the sale nearly $1,000. The next year he and his neighbor sharecropped 20 acres of melons and Bennett's half came to $1.800. He began to see that there was real money in melons. He began to ask himself why should e sharecrop melons when he owned 50 acres of land that were now bringing a very poor return.

In 1943 Bennett went on his own. But that year he got his crop to market a little late and didn't get a good price. He vowed not to make that mistake again.

Bennett got to thinking. It was just plain common sense that the only way to get his melons to the market earlier so as to get a premium price was to get his crop started earlier. But how? That was the question. Finally, he hit upon a method.

After three years of refinement, the method is essentially this: About a week before planting time, Bennett digs a hole in his backyard about 18 inches wide and two feet deep. Then he pours in a couple of buckets full of boiling water. When it has soaked in a flour places his melon seed in a flour sack and puts the sack of seed inside a burlap bag and buries it in the hole. Each day for about a week he pours warm water over the buried seed. At the end of the week he digs up his seed and plants them in his field. Results: His melons sprout almost immediately and his crop is ready for market from one to three weeks ahead of some of his neighbors.

However, he has not kept this discovery a secret; he has shared it with his neighbors, with the result that his county is becoming one of the early Texas watermelon markets for northern buyers.

Since 1944, Bennett has planted 25 acres to melons each year. His yield has ranged from eight to 12 carloads, and his returns from $5,000 to $8,000.

With the extra income, Bennett has not only repaired his barn and built himself a new home, but also he has increased the size of farm from 30 to 1225 acres. County Agent Watson has helped him plan a balanced farming program. Bennett doesn't depend entirely on melons. This year he is growing corn, cotton, grain sorghum, hay, wax beans, cucumbers, and sweetpotatoes besides chickens and a few hogs.

"Now I feel that I have a sound farming program," says Bennett, "no matter which way the wind blows, I've got something to sell . . . you know, that makes a fellow feel secure."

Arkansas Farmers Vie Again in Balanced Farming Contest

Arkansas white and colored farmers are vying again this year in their second annual "Balanced Farming" contest, reports the Ark., State Extension Service.

The contest is open to all farmers sharecroppers and tenants, as well as owners. However, each group competes in its own category. Negro farmers compete in the live-at-home division of the contest.

Major emphasis is now being placed on " Balanced Farming" as a means of getting farmers to stop putting all their eggs in one cotton basket, says Associate Director Aubrey D. Gates of the Ark., State Extension Service.

Rural Areas Show

(Continued from page 1)

try as a whole cannot be called high, nevertheless the rural farm segment lags behind the others.

Despite the great need for educational services in rural areas, the NEA survey also reveals, it is common knowledge that country schools are the least adequate of any in the United States at this ime, in terms of facilities and extent of education provided.

On April 1, 1948, the U. S. Senate passed the federal-aid-to-education bill (S 472), by a bi-partisan vote of 58 to 22. A similar bill (HR 2953), must be passed by the House of Representatives before this legislation is enacted.

Both of the federal bills are equalization measures, it is explained, which, through their annual appropriation of $300,000,000, would enable all of the states to give a minimum of educational opportunity to every public school child. The federal funds would be apportioned among the states, under an objective formula, in direct ratio to their need and effort.

Eighteen states have rural farm residents who average an educational attainment at or below the national average for the entire rural farm group. All of these states would benefit from federal aid, thus raising this average, the NEA concludes.

Singing Groups to Share

(Continued from page 1)

be held in capital or largest city of each state, with winning groups competing for selection to appear in the festival semi-finals to be conducted in Washington, D. C.; Raleigh, Charlotte, Charleston, S. Carolina; Atlanta, Jacksonville, Tampa, Birmingham, New Orleans, Memphis, Houston, Dallas, Oklahoma City, Wichita, Jackson, Miss.; Little Rock, Kansas City, Mo.; St. Louis, Louisville, Indianapolis, Cincinnati, Cleveland, Detroit, Los Angeles, Seattle, Minneapolis.

Quartettes, trios and other choral groups desiring to compete for the fabulous prize awards, or, ministers, churches, religious, fraternal and similar organizations wishing to sponsor festival concerts in their city are invited to communicate with National Music Festival Society, 48 West 48th St., New York City. No entry fees or other assessments are to be made. B. J. Murray is contest director.

Joe Lewis, 4-H Boy Wins Award with Grand Champion Calf

Joe Lewis, 11-year-old 4-H club boys of Ala., won an award recently as the owner of a 990 pound calf that was acclaimed the Grand Champion at the West Ala., Fat Stock Show at Demopolis, Ala., for farm boys and girls, reports the Ala., State Extension Service.

Lewis' champion won out in competition with 35 other calves. The animal sold for 55 cents per pound, brings a total of $544.50. The show was sponsored by the Demopolis Chamber of Commerce, and is one of two annual shows in which colored farm youngsters of Ala., show off their prize animals. The other show is held at Montgomery.

Effects of Farm Mechanization Seen in Minimum Wage Rates

The minuimum wage rates for sugar beet workers which the U. S. Department of Agriculture has announced for work on the 1948 crop takes into account the part that farm machinery is now playing in the cultivation and harvest of sugar beets.

Department officials say that studies of labor requirements under different methods of cultivation and harvesting make it possible to evaluate the contribution of mechanization to sugar beet field work. In line with these studies, there is now a reduction in piece-work hoeing rates on farms where cross-cultivation is carried out. Although lower wage rates are established for piece-work that follows in the wake of mechines which reduce hoeing and thinning chores, workers are likely to be able to more than make up for the lower rate by covering a larger number of acres.

The rates announced are to be paid by growers—in sugar beet States except California—who apply payments under the Sugar Act of 1948. The rates became effective on March 15.

Minimum time rates are established at 60 cents per hour thinning, hoeing, or weeding, and 65 cents per hour for harvesting. Minimum price-rates are established for certain operations at varying rates for each of the six wage districts into which the sugar beet States have been divided.

Dr. Arthur Raper to Speak at Va. Farmers Conference

Dr. Arthur Raper, social science analyst of the Bureau of Agricultural Economics of the U. S. Department of Agriculture, was the principal speaker at the Virginia Negro Annual Farmers Conference to be held at Virginia State College on April 15.

Dr. Raper, who is the author of several books, including Tenants of the Almighty and Perface to Peasantry, discussed some aspects of part-time and full-time farming in Virginia and the Upper South.

Other features on the conference program were demonstrations on the development of a practical livestock enterprise, care and management of brooding chicks, pasture improvement, and rural electrification, according to an announcement made by Ross W. Newsome, State agent for Negro Extension work.

Louisiana 4-H Club Youths Show Adults How to Grow Corn

Colored farmers in Franklin Parish, La., are trying their hand at a new method of growing corn this year as a result of a 4-H demonstration last year which showed them up, says T. J. Jordan, assistant State agent of the La. Extension Service.

Jordan says that while the adult farmers were growing corn last year by the old method, the 4-H'ers were carrying out a demonstration in which they used certified hybrid seed, planted it at the proper time, and used the recommended amount to fertilizer. The adults watched to see how it would come out. At harvesting time, the 4-H club boys got a yield of from 46 to 61.3 bushels per acre; the adults barely got 20 bushels per acre.

"There's no argument now," says Jorlan "the adults are convinced that it pays to grow corn the modern way."

Go To It, Captain

James L. Hicks, a columnist for the Baltimore Afro-American, a native of Akron, Ohio, volunteered for Army duty in World War II and worked up from buck private to captain. As a newspaper man of the present "pre-war" period, Capt. Hicks is offering his services to ex-GI's with the hope that they can get some of the benefits promissed them in laws passed by the politicians, but which veterans so often fail to get because of red tape and the downright cussedness of the jobholders who administer veterans' affairs.

Capt. Hicks has found out he says, that "of all of the tricks pulled on veterns, thus far the run-around is the most popular. He means of caurse that the run-around is most popular with the job holders who seem to think that making themselves solid with the politicians who do not want to give veterans their due is a patriotic service.

Capt. Hicks says that he is going to open up once a month in the colums of the Afro a "Nutcracker Post Office." His intention, he says, is to "expose persons in office who are being paid by the tax-payers" to help the veterans.

The captain further explains his service as follows:

"Here is the set-up: You (the veteran) write to this colum, stating your problem in a few words and giving your name and address. Your problem will be published and at the same time be referred to the official who is being paid to give you the answers. The name of the official, to whom your problem is referred, also will be published.

"Then let us know whether that official gave you any help. If he does let's give him credit. If he does not, let's give him---well, let's tell the public about it. If your case is one that cannot be helped, as many veterans' cases are, let's be big about it and not raise the roof.

Capt. Hick, got as his first client Veteran Clifford Greene of Springfield, Mass. He refers this veteran's problem to the Navy's Office of Public Information in Washington and specifically to "Lieut. Dennis Nelson who, Capt. Hicks assures us is well qualified (and well paid) to answer such questions.

Frankly, we see great possibilities for Capt. Hicks' "Nutcracker Post Office." It can be even more effective than either the veterans organizations or the NAACP as for as the Negro veteran's problems are concerned.

This pitiless publicity has more terrors for politically-minded job holders in charge of veterans' affairs than any letter writing that these other organizations may engage in.

Don't Get Dewey Wrong

A lady associate editor of the "Southern Weekly" is quoted extensively the Nashville Banner last week when she contrasted the difference in treatment that Southern Republicans received at the Republican National Convention to that which Southern Democrats received at their National Convention in Philadelphia. The wish is father of the thought, we suspect, when the lady states in effect that the Republicans are more reactionary than the Democrats on fair employment practices, and indicates that Gov. Thomas E. Dewey will be a better friend to backward Southerners than Mr. Truman.

Any Democrat wanting to make sure that nothing will be done, or attempted, to enact fair employment laws for the NATION, of which the South is only a fractional part, will come nearer seeing the status quo maintained by voting for Mr. Harry S. Truman. For if Mr. Truman is elected president, the congress that will go in with him will be dominated by Southern Democrats, opposed to every civil rights proposal Mr. Truman is now frantically advocating.

On the other hand, it is most unfair to Gov. Thomas E. Dewey to say he is insincere in advocating fair employment practices on a national scale. Dewey has already DONE SOMETHING about fair employment practices in the great state of New York. It is also unfair to the Republican Party to say it rejects a proposal to include a pledge of fair employment practices legislation in its 1948 platform. The lady who believes this to be so evidently hasn't read the Republican platform. She possibly confuses what the Republicans said in their national platform with the anti-Republican views that appear in the platform adopted at the Republican State Convention this year.

Here is what the Republicans said in their platform adopted at Philadelphia:

"One of the basic principles of this Republic is the equality of all individuals in their right of life, liberty and the pursuit of happiness. This principle is enunciated in the Declaration of Independence and embodied in the Constitution of the United States; it was vindicated on the field of battle and became the cornerstone of the Republic. This right of equal opportunity to work and to advance in life should never be limited in any individual because of race, religion, color or country of origin. We favor enactment and just enforcement of such Federal legislation as may be necessary to maintain this right at all times in every part of this Republic.

Following the UNANIMOUS adoption of the platform, containing the above plank, Gov. Dewey delivered his acceptance speech. He endorsed the platform without any reservation. Specifically, with regard to the platform, Mr. Dewey said:

"Our platform proclaims the guideposts that mark our steadfast and certain endeavors in a fearful world.

This magnificent statement of principles is concise and to the point.

You unanimously adopted it. I proudly support it. It will be the heart of the message I will take to the country. After January 20th, it will be the cornerstone of our Republican Administration."

Gov. Earl Warren, the vice presidential nominee, in his acceptance speech pledged his loyalty to Gov. Dewey in carrying out the Republican platform. Specifically, Gov. Warren said:

"I pledge you that I will work with him (Dewey) to make this government of ours responsive to the people ot all times. I will work with him to make it a humane government, and an efficient government, and above all, a government of integrity from top to bottom."

Plainly it is unfair to Southerners—Democrats or Republicats to infer that Thomas E. Dewey, as President of the United States, and leader of a great party will break faith with the people on pledges that got him the nomination and will get him elected. There is nothing in the life of this dynamic young leader that justifies the insinuation that he is a double-talking politician, of the same mold of those whom the Democrats have elevated to leadership in recent years. And so, if a sensible and enforceable fair employment practices law is not enacted in the new Republican administration it will not be because Mr. Dewey did not fight for the passage of such a law.

The Dixiecrats could be called the new Bull Moose Party, even though up to now they haven't got around to throwing the moose at any of their meetings.

Get Smart Bro. Dawson

After reading what Congressman William Dawson and his aides say in their widely-circulated appeal for funds with which to elect President Truman, it is clear that the congressman is not taking the kind of medicine he has been recommending for the other members of his race. In our opinion, the smartest thing Mr. Dawson has said since he became a congressman was the simple admonition:

"GET SMART"

The congressman was talking about the great game of politics. Get smart, he urged in dealing with the many conflicts and cross-currents of these politically important times. Get smart, he meant, we presume, with regard to lining up behind a candidate for the presidency this year.

But Congressman Dawson is not only backing President Truman for reelection but asking his generally poor race of people to give a million dollars of their hard-earned money to help finance President Truman's campaign.

Now we hold that neither voting to re-elect Mr. Truman and certainly not the dumping of a million dollars of "colored" money into the very obvious "rathole" that Mr. Truman's candidacy represents, shows "smartness' in politics.

Plainly, President Truman is a "gone gosling." Even if colored voters lined up for him as they were accustomed to line up for Franklin D. Roosevelt they could not elect him president this year. And the way colored voters are lining up for Henry Agard Wallace, and for much better reasons than they have for voting for President Truman, it is plain that Mr. Truman would be lucky if he could command even fifty percent of the support colored voters gave Roosevelt.

We are sure that Congressman Dawson remembers that in 1944, nearly every colored voter who was supporting Roosevelt for president, let it be known that he would vote for Dewey if Roosevelt were not in the race.

In 1948, Dewey is far more popular with colored voters than he was in 1944.

Colored Democrats Giving Big Money To Help Truman

New York —Assurances that 50,000 Negroes in Arkansas would cast tion for President Truman was given this week by Dr. J. M. Robinson, head of the Arkansas Negro Democratic Association.

Dr. Robinson underscored his declaration with a personal contribution of $1000 to the National Citizens Committee for the Re-election of President Truman.

In a conference with Mrs. Anna Arnold Hedgeman, executive director, at the Committee's headquarters in the Biltmore Hotel, Dr. Robinson reported completed plans for gearing his state-wide organization to an aggressive campaign for the re-election of the President. He predicted that all of Arkansas' 9 electoral votes would be cast for Mr. Truman.

Dr. Robinson also turned over to Mrs. Hedgeman a $20 check from his organization with an affiliated membership of 30,000 qualified voters. He made clear that it was only a starter contribution to the fund-raising drive sponsored by the National Citizens Committee. He indicated additional funds would be forthcoming.

These two Arkansas contributions totalling $1200 followed on the heels of a $100 check from the Hon. C. Mott Shavers, leader of New York City's 14th Assembly District. Mr. Shavers, long identified with Democratic Party activities, is one of the leaders spearheading the Truman re-election drive in Harlem.

Discussing the coming campaign with Mrs. Hedgeman, Dr. Robinson took to task Henry A. Wallace, former Democratic Vice President, and declared that he should withdraw as presidential candidate on the Progressive Party ticket. "Wallace is unfair to his friends, unfair to himself, and most important, unfair to the Democratic Party for remaining in a race which he admits he cannot win." He said that if Wallace insists on fighting to the finish for the presidency, he will be guilty of "aiding and abetting" the enemies of Southern Negroes.

Rev. S. L. Scott, Sr., Pleased With S. S. Congress; Commends National Baptist Union-Review

Dr. Henry A. Boyd
Nashville, Tennessee
My dear Dr. Boyd:

This is to say to you that I was happy to be able to make the little contribution that was made to the recent session of the Sunday School Congress, which was held in Kansas City, Mo. I was also pleased to read of the great success that was enjoyed while there. I am praying that as the years come and go that there will come to the Sunday School Congress greater success. As to the National Baptist Union-Review that's published each week I think that it is one of the best papers that is published when it comes to what is going on in a National way all over this Country. I have been talking about it to my many friends, and they too have subscribed for teh same. I shall continue to do whatever I can to give my support to it.

The Virginia Delegation to the National Baptist Convention in Oakland, Cal., will leave on Sept. 4th 3:45 p. m. by the way of the C and O from Norfolk, Va. to Chicago, and on to Oakland, Cal.

We are praying to meet there in the Name of the Lord and talk of His Goodness and in a better way do what we can to bring about better relationship in this sinful world as Christians.

May God ever bless you and keep you strong that greater good my be accomplished through you in His name.

Yours truly,
S. L. Scott. Sr.

Back To 1900 Go Designers Of New Hats For Ladies

New York—There is an entirely different look about the hats for the Fall 1948. Millinery designers have borrowed from the 1900's to give us hats that are Chapeaux—not just a bit of fluff perched on top of the head. Many hats are worn straight on the head. Other hats are worn to one side showing the profile of the face. Such hats call for more hair than the short-haired woman possesses. But, the millinery designers tell us that is no problem, simply attach an extra piece of hair.

The hair-do shown is smart and looks so-right with the new hats. Miss Mary Cunningham, assistant stylist for Howard Tresses poses in a profile hat. The white felt hat features a sweep of black glycerine aigrette feathers and a rhine stone pin. She achieves the one sided effect by attaching a soft cluster of curls while the hat drapes to an extreme over one ear. Her half bang adds a dashing French air.

Whether wearing a hat or bare-headed, every appearance in public is an important one for the fashionwise woman. She uses every art at her command to create the hair-do which will keep pace with the clock. Hair makes sense in the current silhouette, for today a hair-do is a well planned design, measured to fit a person's face and figure, and to complete the fashion picture. Women appear feminine with beautiful heads capped with a flattering coiffure of shining hair.

17-Year Old Boy Scout Of Missouri Cited For Bravery

New York—William Jackson, Jr., 17-year-old Scout of 102 Hill Street, Columbia, Mo., who with three other Boy Scouts saved the lives of five small children from burning to death in their home, is the winner of the 1948 Veterans of Foreign Wars Scholarship, it was announced last Wednesday night by Dr. Elbert K. Fretwell, Chief Scout Executive of the Boy Scouts of America.

The V. F. W. scholarship, consisting of $500, and a gold medal, is awarded annually to an outstanding Boy Scout of First Class rank or higher, between 15 and 20 years old, who has previously received a life saving award of the Boy Scouts and who has demonstrated Scout character, leadership, good scholastic ability and unselfish service to others.

Presentation On Sept. 2

Ray H. Brannaman, Commander-in-Chief of the Veterans of Foreign Wars, will present the $500 scholarship check and gold medal to young Jackson next Thursday, Sept. 2, at 2:45 p. m., at the Kiel Auditorium in St. Louis, during the national encampment of the veterans' organization.

The Negro lad received the Gold Honor Medal from the Boy Scouts as long as it is given for nothing; yet when it comes time to spend a little money there is always someone found who never gave anything for the mere giving. The same goes for the "Pen. Yes, for the Press.

Every once in a while there must be a reminder as to the value of the Negro Press, the value of pub- for his part in the rescue. He represented last year's 47 Boy Scout heroes in a symbolic ceremony at the National Council Meeting of the Boy Scouts in May 1947 in New York.

The four Boy Scouts, all Negroes, were honored for saving the five Glascow children, the eldest five years old, when fire destroyed their home on Oct. 10, 1946, while their mother was away on an errand.

Hubert Stapleton also received the Gold Honor Medal while Augustus Chumley and Burton Richardson received Certificates for Heroism.

The Scouts, returning home from football practice, came upon the blazing dwelling. Finding the front door locked, they broke a window. Scouts Jackson and Stapleton entered the house and passed two children through the window to the other Scouts.

Heavy smoke forced the two Scouts to leave after they tried to force the locked door of a room where they thought there might be other children. They tried again a few minutes later and forced the door open but the smoke and heat halted them. Then crawling on the floor they saw the logs of a crib, when they heard the cries of other children.

Enter Smoke-filled Rooms

Jackson felt around in the smoke and grabbed one child by an arm and another by a leg and ran with them out of the house. They still heard another cry. Stapleton entered the smoke-filled room, found his way to the crib and came out with the fifth child, an infant. Then to make certain, all four Scouts crawled into the room again, felt everywhere but found no one else.

Scout Jackson averaged Grade "A" in his senior year at Douglass Hgh School, Columbia, Mo., this year. An honor student, he was president of his sophomore class, a member of the school band, and a letterman in football and basketball. He also helped to edit his school paper.

Active in Church Work

Jackson was president of the Youth Group of the Baptist church he attends regularly and is a member of its choir. He was secretary of the Church Youth Conference held in Kansas. As a "good turn" he often cleans the church yard.

He took a leading part in a Scout show to raise funds so that his Troop could attend summer camp where he was a leader. He appeared in numerous school assembly programs and before the Kiwanis Club at Moberly, Mo., to promote Scouting.

He directed traffic before and after school to make crossing streets safe for young pupils. He gave blood for the war effort and once for a dying girl. He helped to oil streams to combat polio and once averted a possible accident by reporting an open sewer to city officials.

THE COLORED

YMCA

Can Accomodate

TRANSIENT MALE PATRONS

When coming to Nashville you are requested to stop at the Colored Y.M.C.A., Fourth Avenue North and Charlotte Avenue.

The rooms are located on 3 floors. Splendid outside rooms with much of the modern conveniences.

It is located in near down town Nashville.
There are clerks on duty twenty-four hours every day.

The rents are reasonable.

If any man wishes to take permanent residence in the building, this can be arranged.

Come to the Colored Y.M.C.A. while in the city.

Nashville 3, Tennessee

Columnist Opposes Emigration Bill Of Sen. Russell

New York—Somehow this columnist vehemently distrusts the new proposed bill which is scheduled to be introduced into Congress when it convenes again, by Sen. Richard B. Russell (Dem. Ga.) providing for up to $1500 to Southern families desiring to move to a new area to better social and economic positions. For most of those families desiring to leave would most naturally be colored.

I distrust the motives of the sponsor of this Bill. First, because the content of such a bill would prove to be of negative benefit to the South, whom the sponsor represents, since the South lacks wealth, industrial resources or complete acquisition of the latest improved farm equipment to have a real surplus of labor. And surpluses of labor are the only natural reasons for removal of families from a given area to another, by Government fiat.

Secondly, Sen. Russell is a Southerner and a Georgian with no sincere desire to free either white or Negro from the toils of Southern aristocracy.

Instead of proposing a bill to furnish money to Southern residents to enable them to emigrate to other sections of the country, Sen. Russell could do both his South and the rest of the country a greater service by carrying through the fight for civil liberties in Congress and proposing legislation that would be instrumental in improving the farmland, farm equipment and industrial outlook of the entire South to benefit the people, instead of the few.

Then free men, possessed of a competence garnered through free labor, amply recompensed with decent pay, could either stay in the South or leave it, without federal help, which no doubt under Southern administration would be rampant with "white supremacy" abuse.

Yes, we think that Sen. Russell's proposed bill is just another Southern trick to thwart any effort at legislation designed to achieve civil liberties in the South or it's a well-planned move to use the U. S. Senate as a forum to further degrade the Negro and frighten the wits out of other sections of the country, through their fear of such a mass migration upsetting their own economy.

As long as "State's Rights" and all of its evils exist in the South, we distrust all Southerners who come "bearing gifts."

NAACP Again Takes Non-Partisan Role In Nat'l Politics

Constant criticism over the past few years by several newspapers have apparently brought results in the efforts these editors have made to rescue the National Association for the Advancement of Colored People from its apparent affiliation with a political party. The association, on August 9, sent out on its official stationary a statement to the press acknowledging that it, as an association is a non-partisan organization. The general impression throughout the country for many years has been that the NAACP was an affiliate of the Roosevelt-Truman administration, largely because of the partisanship for the administration that has been shown by Walter White, secretary and Roy Wilkins, editor of the Crisis.

There are just as many, if not more, Republicans in the membership of the NAACP as Democrats, and of course some of the most prominent NAACP members are lined up with the Progressive Party headed by Henry Wallace despite Walter White's criticism of Wallace decision to organize a third party. Dr. W. E. B. DuBois one of the founders of the NAACP is affiliated with the Progressives.

The NAACP statements of non-partisanship is as follows:

John A. Pritchett Chosen As Manager For Dewey-Warren Ticket In Sixth District; Reece And Acuff May Maintain Own Headquarters

Further proof of the determination of the Republicans of Tennessee to carry the state for the Dewey-Warren ticket was demonstrated early this week when the Hon. Ralph Dugan of Athens, state manager of the ticket, by appointment of National Campaign Manager, Herbert Brownell, Jr., came to the city, held a meeting with several Republican leaders of Nashville and Middle Tennessee and announced the appointment of campaign leaders for several counties.

Of considerable local interest was the announcement that the Hon. Jarman-Pritchett, a leader of the Jarman-Protchett forces here and a pre-convention supporter of Gov Dewey for president, has been named manager for the Sixth District, which comprises Davidson County.

The several appointments of county campaign managers emphasized the decision of the Dewey followers to take charge of the Dewey-Warren campaign in the state and not to trust the campaign to the managers that previously were appointed by State Chairman Guy Smith, who had chosen persons to conduct the campaign without consulting any of the Dewey leaders of the state. Mr. Smith's action failed to get the approval of the national leaders of the Dewey-Warren campaign. Mr. Brownell stated that no appointments of campaign managers in the state would be made without the approval of Congressman John Jennings.

It is understood that the Dewey forces will insist that the conduct of the Republican campaign in Tennessee must be entrusted to original Dewey men. Apparently this has not set well with the followers of the Hon. B. Carroll Reece, who claims to "have the organization." However, the so-called Republican organization proved to be so feeble in the 1946 congressional campaign when Mr. Reece was the chairman of the Republican National Committee, that state as well as national Republican leaders are insisting that "new blood" be entrusted with running the campaign this year. The hope has been entertained that Mr. Reece and his faction would agree to this, but there was little evidence of any such agreement as the Republicans gathered in Nashville this week for the meeting of their state executive committee. It seemed possible that the Reece faction woud confine itself to running a campaign that would undertake to elect Mr. Reece as United States Senator and Roy Acuff as governor.

C. W. Moore, Jr., of Lawrenceburg who was president of the Dewey Club of Tennessee prior to the recent national convention was named last week as the Middle Tennessee manager for the Dewey-Warren ticket by the Hon. Ralph Dugan. The appointment of Mr. Moore relieves Fred Elledge, a strong supporter of Gen. A. V. McLane of the position of running the Dewey-Warren campaign in Middle Tennessee, a position which he had been given by State Chairman Smith.

The battle for leadership between the Dewey forces and the followers of Mr. Reece appeared to be so intense it was probable Mr. Brownell himself, might be called to the state to straighten things out. However, it was not thought likely that the national leaders would recede from the position they have taken already—which is that the Dewey forces be entrusted with the chairmanship and other top positions in the campaign organization of the state. It is probable that the national leaders have no such problem to handle elsewhere as they find in Tennessee. There is general acquiescence in all states by the Republican leadership to the right of the national leaders to select those whom it wants to manage the campaign. But in Tennessee, State Chairman Guy Smith failed to qualify as a chairman who was willing to take the necessary steps to form a harmonious working force for the campaign. He showed a partisanship that apparently displeased the national leaders, with the result that the three men Mr. Smith appointed to run the state campaign will not be given the posts Mr. Smith wants them to have. The three persons Chairman Smith named were Fred Elledge of Woodbury; John W. Kilgo of Greenville and Howard H. Baker of Huntsville. All are able men but two were strong supporters of Senator Taft for the Republican nomination and the other was not a conspicuous supporter of Gov. Dewey.

Nevertheless, when Chairman Smith appointed the three leaders he let it be known that he had designated them to run the Dewey-Warren campaign in Tennessee as well as the state campaign. Said he:

Whoever our candidates for goverior and senator may be when the primary is over, they will be fortunate in the management we have been able to obtain for their campaign and that of the national ticket in Tennessee.

In addition to the Hon. John A. Pritchett, manager for the 6th District, it is understood that a county campaign manager for the Dewey-Warren ticket is to be named. However, the 6th District is also Davidson County exclusively and it would be easy for the Mr. Pritchett to be both district and county manager.

Mr. Pritchett's appointment assures the largest participation of colored Republicans in the campaign they have ever had because the new chairman is a sincere "get-out-the-vote" enthusiast. He and the Hon. W. Maxey Jarman see eye-to-eye with a large host of Republicans here who in the past have sat on the sidelines and refused actively to participate in Republican affairs because the management was in the hands of men who had no inclination to build up a numerically strong party—being content with having just enough persons to compose an executive committee.

The most significant fact in connection with the appointment of Mr. Pritchett to manage the campaign for the Dewey-Warren ticket in this city and county is that it is national recognition of the victory the Jarman-Pritchett forces won last November and December when they overwhelmed the Old Guard at the county convention in November and at the district convention in December chose Mr. Jarman and Dr. Henry Allen Boyd delegates to the Republican National Convention and chose Mr. J. L. Perry and Dr. L. A. Bowman as alternate delegates. It is true that the Republican State Committee refused to respect the wishes of the Republicans of this city and county and displaced all of the party leaders the people here had chosen, but apparently the national party leaders do not like the idea of setting aside the will of the people. Especially when it appeared that the action of the State Committee was determined to thwart any attempt of the followers of Gov. Dewey to send delegates to Philadelphia that favored his nomination for the presidency. It is well known that since as far back as 1940 a majority of Tennessee Republicans have favored Dewey for their party's presidential nomination. This year as a result of many unfair tactics, Mr. Dewey was only able to get eight of the 22 delegates on the second and decisive ballot at Philadelphia.

PRUNES FOR SALAD

No cooking necessary for these plump delicious prunes so good to use in salads. Rinse prunes, place in glass jar, cover with pineapple or grapefruit juise and store covered in the refrigerator for 48 hours

NEW FLAVOR

A bit of pickle relish or mustard chow chow folded into your favorite macaroni and cheese dish before baking gives it the new taste as well as a new look.

Bus Riders Expect Another Bite From "Going Broke" Firm

Nashville's bus-riding public seemed perfectly willing to take the plunge into a so-called "socialistic experiment"—that of letting the city take over and run its own transportation system, following announcement that the men who run and service local buses would go on strike Sept. 1, when their Co. intended to put into effect a 9-cent an hour reduction in the wages it pays its workers.

Bus riders were recalling the fact that they already had been subjected to two big bites by the local bus firm, despite the fact that local voters had elected a mayor and a city council majority that was pledged to retain the 5-cent bus fare, from which it was said the bus company had made a big killing all during the war years.

In his 1947 race for mayor, the Hon. Thomas L. Cummings had promised: "Nashville will always have a 5-cent bus fair." However, this was before the big rise in the cost of living for everybody. And so, there was little or no protest when the mayor, after election, agreed to let the bus company put on a 10-cent fare for all patrons who rode beyond the city limits.

But within a year after that raise, the bus company, following a demand for more wages by its workers, sought a straight 10-cent fare—or 100 per cent increase in the price of rides, although no 100 per cent increase in wages was granted the workers, and the company was saying it had to raise fares to meet the demand of the workers for a raise in wages.

This demand for a 10-cent fare was compromised with the company for a straight 7-cent fare or four tokens for 25 cents. It looked like the company was doing its usual "land-office" business with the 7-cent fare. But it continued to agitate for 10-cent fare as the next on program of its series of bites into the wages of bus riders.

There has been long and costly litgation over the fare matter for many months, finally ending in the refusal of Chancellor Thomas A Shriver to let the company put the ten-cent fare on the public solely because the company was claiming to be losing thousands of dollars every month trying to live on a 7-cent fare. City Attorney Blackard and other experts say the company only seems to be losing money because of the way it keeps its books. The public has seen no improvement in the service the company is rendering, and with half of its customers being compelled to stand up at all busy hours of the day. The hundreds of working people of North Nashville who must rise early, catch buses and make a time-wasting circuit down into town in order to go to places of employment in Western parts of the city, were expecting cross-town buses to relieve this situation. It is true that representatives of the bus company have said that cross-town buses would come whenever Mayor Cummings furnished streets suitable for the buses to run on, but the fact remains that these hardworking people continue to pay for service they are not getting.

Many of these workers have been to large cities like Chicago, New York and Detroit and contend that it is downright ridiculous for Nashville to be asking for a 10-cent bus fare to carry people the short distances that the local buses travel in getting most of the customers to their places of employment.

There has been much talk by city councilmen in favor of having the city take over its transportation system by buying out the present owners, who ought to be ready to sell in a hurry if they are, as they say, on the verge of falling into the hands of the receiver. But after quieting the people with soothing talk, the councilmen have turned to such items as a municiple auditorium and a bridge across the Cumberland to provide relief for speed-loving motorists. Nobody is doing anything to ward off the next bite the bus company is about to make on the shriviling pocketbooks of the bus riding-public although they were the "rock in a weary land" for nearly all of the councilmen who got elected in 1947.

It is believed that the public would vote for a city-owned transportation system in an even bigger majority than that it rolled up against Gov. McCord and the sales tax on August 5, if the council would call for an election.

The latest talk is that the city is getting ready to meet the strike threat by introducing a system of electric buses. But a skeptical public is fearful that the proposal will not get beyond the talking stage and along about September 1, the bite for the 10-cent fare, even for riding just a few blocks in the city, will be put on the people and they will be called upon to shoulder the burden and further reduce their standard of living in order to get to and from their places of employment.

"The Use and Abuse Of Church Music"

Paper Written by Mrs. Edna Mae Dorsey of Houston, Texas, for Recent Sunday School Congress Session in Kansas City, Mo.

We must first consider the church at work, a building set apart or consencrated for devine worship. The collective body of christians a particular body of christians, the clergy, to conduct a service, to say prayers. Music is the language of emotion; our emotion is our inner feeling some of the values of music

1. It puts us in communion with God.
2. It helps us in solving life's problems
3. Music has evanglestic values
4. It has educational values
5. It helps in making the unseen real and attractive

None of us have ever seen God but when we sing or hear sacred music we can, through a spiritual eye see God, and with our emotions we feel him within

One way of being sure that the music in our churches is noe misused is to place efficient persons over that department.

Qualifications

1. He or she must have a christian character
2. Must be a loyal church member
3. Must have a pleasing personality
4. Must have a cooperative spirit
5. Must have a sense of humor
6. Must have a spirit of humility
7. Must have a good musical knowledge

When the music director is ot efficient the proper evalution can not be given to our hymns, gospel, or spiritual songs

I shall give example of the two classes of music.

The Hymn: a hymn is a prayer song or a prayer set to music. A hymn is addressed directly to one of the members of the Trinity. Example Nearer my God to thee, or Jesus Savior pilot me.

A gospel song is a testimony set to music and is addressed to the people. Example Work for the night coming.

The music should harmonize with what ever period of the service we are engaged in.

When we are in worship service we should sing such songs as Holy, Holy Some Thou Almighty King, or My faith looks up to thee.

For concencration period we should sing such songs as, Have thine own way Lord. Holy Ghost with light divine.

Music was used in rebuilling the temple. Ezra 3-11 and they sang together by courses in praising and giving thanks unto the Lord because he is good, for his mercy endureth for ever toward Israel and all the people shouted with a great shout when they praised the Lord, because the foundation of the house of the Lord was laid. Psalm 147-7. Sing unto the Lord with thanksgiving sing praises upon the harp unto our God.

St. Mark Bapt. Church Rev. C. T. Lee, Pastor

Mrs. Edna Mae Dorsey

Old Jimcrow Myths About Blood Live On, Nevertheless

By Ray Lawrence

The old vicious anti-democratic segregation of blood is still living, yet during the World War II, the Red Cross began a campaign, encouraging all citizens to donate their blood to save the lives of American soldiers wounded on the battlefields.

Loyal Americans, as loyal as ever, Black, White and Yellow were regular visitors at Red Cross Donor Stations. Of course, there were in some parts of the country, and particular in the south, separate stations set us for patriotic Negro donors. This Jim Crow policy of the Red Cross extended further. It was thought that the blood of a Black man mixed with that of a white man, would cause degeneration of character or would affect the color of his (white) offspring. With this in mind, the Southerners took special pains to carefully label and keep separate all the blood from te Negroes and used it only of Negrocs. The Southerners are so deeply ingratiated in the Jim Crow myth about blood they refuse to accept the findings of the world's leading scientists, who have proven more than oncc it is impossible to identify any race or color by the examination of the blood of the individual. While there are different blood types, such as A. B. AB, and O, there are not dependent upon the race or color of the individual, and all these typcs are found in all races.

Actually, the policy of blood segregation is not based on facts, but on prejudice. It is the same kind of prejudice which provokes white supremacy—the same kind of projudice which fosters jimcrow hospitals, separate sections of passenger trains, and bans Negroes from restaurants, hotels and white educational institutions.

New York May Become Capital Of Film Industry

New York City (G)—There is a tremendous fade out in Hollywood these days, and the reason is the tall stories about the earth-tremors in California. Every day, train loads of Hollywood stars, technicians, producers and sports jacket wearers are arriving East.

Rumor has it that many of the major film plants are reducing their staffs to about one-quarter, and there is hardly any picture making going on. Morale in Hollywood is so low that film folk are selling their houses, and moving whole families to New York, Chicago or to their home towns. What films are being released now, wre produced last year and few new films are being released now, were course, the low quality of current films are also cited as a contributing factor.

North Bound Bethlehem District S. S. Convention Closed Successful Session

Panola, Ala.-(Specıal)-The leaders and members of the North Bound Bethlehem District Sunday School Convention have just closed their 1948 session, which is said to have been one of the largest in the history of Ala. They have as their motto "Building for Christ."

From all reports, this splendid group of workers went over the top spiritually and financially. Mrs. Mary L. Speight, the reporter, says they feel that there is room for more and better success, yet they are still climbing and trying to make their convention second to none in the Baptist denomination.

Much credit is due their director, Rev. H. S. Stanton, president.

Young Men And Women From All Parts Of Tennessee And From Other States Get Rewards For Diligent Study; 11 Are Masters of Art

Two Nashvillians were among eleven who were awarded the Master of Arts Degree at A and I State College's summer commencement, held Sunday evening, August 15th, and 28 other Nashvillians were awarded the Bachelor of Science degree. The graduates heard an inspiring address by Dr. Hugh C. Shuntz, president of Scarritt College, whose subject was "The Abiding Place of Authority." Mr. W. E. Turner of the State Department of Education awarded the degrees and certificates. Following the graduation exercises, a reception was given by President and Mrs. W. S. Davis on the college campus.

The list of graduates was as follows:

MASTER OF ARTS

Myrtle Blackman and Gilbert W. Centers, Nashville; Osie J. Hodge, Shannon D. Little and Lillian R. Maxey, Memphis; Katherine L. Allen, Woodlawn; Kathleen M. Beeks, Covington; Ruby M. Prigmore, Sweetwater; Roy O. Vaughn, Cleveland, a total of nine Tennesseans. Also, Nora L. Roy of Columbus, Ohio ond Harry E. Lash of Dallas, North Carolina.

BACHELOR DEGREES

(Nashvillians)

Bachelor of Science: Roger W. Driver, Robert Lester Everett, Dorothy Oden, Charles Lester Holmes, Fred L. Witherspoon, Clarence Darden Wilkins, all of the Division of Business Administration.

Elizabeth P. Bowman, Corrine Lovie Bradford, Ivey L. Douglass, Grace McKissack, Nannie Christella Wilkerson, Elizabeth Eleanor Williams Wilkins, Bessie Mae Shipp of the Division of Education.

Emerson R. Davis, Katherine B. Jones, Mingo Scott, Jr., Myrtle H. Stone, James J. Vaughn, Princess Prather and Kelly L. Maddux of the Division of History and Geography.

John Louis Driver of the Division of Engineering and Industrial Education.

Minnie Olivia Caldwell, Lottie V. Hyde, John Ada Moss and Olist Tolliver of the Division of Home Economics.

Bernadine V. Carruthers, Division of Humanities.

Eugene Pierre White, Political Science.

Garland Pack, Biology.

OTHER TENNESSEANS:

Division of Agriculture

Andrew Buck Bond, Brownsville, Lucius Bond, Jackson; Ferdinand Jack Holmes, Whitehaven; Earl V. Lucas, Memphis; Charles Maxwell Mack, Tullahoma; Tillman William Payne, Hartsville; James Foster Steele, Brighton; John L. Singleton, Ripley; Raymond Taylor, Brownsville; Altha L. Westbrooks, Arlington

DIVISION OF BUSINESS

Maggie Lee McDowell, Memphis; Napolean Patton, Chattanooga; Edwin James Quinn, Memphis; Bertha L. Washington, Lebanon.

DIVISION OF EDUCATION:

Edith Lyle Bates, McMinnville; Flora Irvine Cox, Chattanooga; Jane Arden Craig, Henry; Rebecca Crawford, Franklin; John Allen Dobbins and Mary Ellen Dobbins, Gallatin; Mayme Peden Harris, Prospect; Walter Hill, Stanton; Henry Holbert, Jr., Clarksville; Annie Cleopatra Hudson, Columbia; Mary Brader Lemons, Fayetteville; Eunice Taber Lucas, Mt. Pleasant; Mattie Lucy McKinley, Carthage; Kathleen McKnight, Centerville; Willie B. Crockett Miller, Christiana; Robert Officer, Oak Ridge; Alma Oglesby, Chattanooga; Arminta Rucker, Springfield; Nannie G. Rucker, Murfreesboro; Bettie Snow Smith, Chattanooga; Mildred Mae Palmer, Sparks, Paris; Imogene Wilmet Springer, Dickson; Ola Mae Todd, Cottage Grove; Bernice Cornelia Trotter, Memphis; James Arthur Welton, Tullahoma; Elma Alder Williams, Murfreesboro; Alexia Blaine Winston, Chattanooga; James Hurley Jones (DIV. Ind. Education), Henning.

Fruzzie Anna Burrus, Murfreesboro; Willie Mae Flack Smith, Shelbyville and Cordell Hull Williams, Hartsvile.

Division of Humanities

Lydia Elizabeth Jackson Clanton, Murfreesboro; Lillian Griggs, Henning; Mary Alice Roberts, Una.

Division of Science

James Harold Bryant, Lebanon; Lela Lucenia King, Chattanooga; Bruce Dunbar Lockridge, Columbia; Charles Whitson, Memphis.

Division of Home Economics z

Wilma Valeria Adkins, South Pittsburg; Malissa Bebe Brown, Chattanooga; Ann Beatrice Gardner, Delrose; Earline Loretta Halliburton, Ripley; Beatrice Fitts Howse, Gallatin; Maxie Lee Johnson, Rockwood; Arlette Maclin, Memphis, Lillian Smith, Portland; Rebecca Smith Hartsville; Mary Ruth Tedford, Knoxville; Altha Louise Williams, Brownsville; Mary Louise Wiseman, Belvidere.

The Dean's Award for Outstanding Research was given to Miss Ruby Prigmore of Sweetwater, 1946 A. and I. graduate who received her Master of Arts degree this year. Her thesis was: "The Quantitative Estimation of the Quality Level of Certain Foods."

FOR OTHER STATES

Division of Agriculture

Robert L. Hurst, St. Louis, Mo.

Division of Business.

John Wesley Jenkins, Loxley, Alabama; Cass Frederick L. Teague, Madisonville, Ky.; Ethelyn Jackson Wilson, Middletown, Ohio.

Division of Education

Vernon Bacon, Paducah, Ky.; Charles Carson, Montgomery, Ala.; Credall Juanita Crosby, Pensacola, Florida; William Athol Leavelle, Hopkinsville, Ky.; Thelma Odessa Thomas, Rhoda, Virginia; Charles Williams, Shreveport, La.; Eleanor Florence Bush, Paducah, Ky.; Lauretta Cantrell, Hammond, Ind.; Georgé A. Penn, Kansas City, Kans.

Division of Humanities

(Bachelor of Arts Degree)

Willie A. Davis, Ruston, Alabama; Thelma Burma Prince, Waterbury, Conn.; Leo Whaley, Williamson, West, Va.

Division of Political and Social Science

Eleanor Mae Bryant, (AB) Savannah, Georgia; John Collins Reed, (BS) Birmingham, Ala.

Division of Science

Marshall P. Bryant, Tulsa, Oklahoma; Warren Cyrus, Dilliner, Pa.; Clem Bernard Holloway, Meridian, Miss.; Jonas Edward Richmond, Prentiss, Miss.; Lily Cee Truly, Shelby, Miss.; Willie J. Williams, Montgomery, Ala.; David James Willis, Newport News, Va.

Certificates

WELDING: Albert Kennedy John T. Gilbert, William E. Holt, Claude H. Toney, and Bennie J Tucker.

WOODWORKING: Robert D. Frazier and Alvas C. Tullass.

Rev. L. S. Thomas Pleased With Congress

Dr. H. A. Boyd
523 2nd Avenue North
Nashville, Tennessee.

Dear Dr. Boyd:

I received your letter a few days ago and we do appreciate your very encouraging letter.

I have been attending the National Baptist Sunday School and BYPU Congress regular for thirty years and I must confess that our last session which was held with the St. Stephen Baptist Church was the greatest of all times: also I feel that the Rev. Mr Williams was at his best.

We must congratulate you and thank God for the work and workers: it seems as if they were at their best.

Dr. Boyd, we thank GOD for you, because I really believe that you are the God-sent Joshua to follow a God-sent Moses for truly you are the man for such a time as this.

I feel that if we would follow Dr. G. L. Prince and you as members of the National Baptist Convention of America we would soon be a race that could measure arms with any group in the world.

LOU SWARZ JOTTINGS

New York City— With this column being one jotting about anything, there's no better time than now to start thinking, talking, acting about at least being alert as to gratefulness. You say what does this mean? Just what it says. Have you ever known the businesses, the individuals, and the groups that you as well as I know enjoy something licity through a Press Agent; the value of advertising through an Advertising Agency or its representative: and surely the value of dropping your dollars with those who have been most liberal without any thought of pay. One might be consulted when money is to be spent whether he accepts your proposition or not. let's wake up and live, shall O say?

Wake up, did I say? And that is just what the Tenants' League is doing here in NYC picketing stores for high prices, advising folk to do without those high priced meats, other foods might as well be included, don't you think? Is it to be inflation or starvation. Or shall starvation be forced because of inflation? The country over everyone might join those picket lines in places where things are too high they nearly reach the sky. DIG? And then we say "I'm forever blowing bubbles.". Do we blow bubbles or words or do we ACT? NYC had its quota and over of Medics and their wives in the last two weeks. California will have its quota and over of Sigma. St. Louis with Deltas, as well as Eastern Stars and Shriners. Rather progressive Groups with something to offer, other than Frolics and fun. Famcee in Tallahassee, Fla., rates top place when it comes to special work shop and Seminars; Fine Arts with Randolph Edmonds. Bill Gray, the pres. is on the ball. Lady Bethune is the beauticians idol and ideal, and her presence in D. C., gave the convention the real "mccoy" Teaming with Alethia Robinson, pianist has been my long desire, and with such a Coach things might well be on the upgrade. Attractive Cecile Walker-s is in Savannah leaves soon for New Orleans where she will do that Social Service Field work for Atlanta U. Hotel Theresa now has Manager, Assistant Mgr. and many new folk as well as new features. Guess so. Nick LaTour is getting about again after his rest in Sydenham Hospital. Sporting their palace on wheels and their cash were three St. Louis sports. Isaac and Enoch Moore, and Buregard Hammond, when they blew into NYC recently. And did we have fun? YES. The happy trio is in Chicago now. Rhea Hall Calloway manages Constance Berksteiner in tip-top fashion whe it comes to the right contracts, and all that goes with managing.

Mr. Stephen Young Writes on Sunday School Congress

Dr. Henry Allen Boyd, 523 2nd Avenue North Nashville, Tenn.

Dear Dr. Boyd: This comes to note you that your kind and welcome white wing messenger of the 7-26-48 was received, read and the contents carefully noted. I was indeed glad to hear from you. Also glad to hear a word concerning the Sunday School and BYPU Congress that was held in Kansas City, Mo., June the 9-13. 1948 which was one of the greatest Summer Schools of Methods that has been held during the 18 years of my affiliation with this great Summer School of Methods. I cheerfully say it is one of the best Schools for Religious Training and for Religious Education throughout the nation.

Oh! Dr. Henry Allen Boyd, I sincerely pray to the Lord that you will live long to carry on this great and important Summer School which inspires an interest in hundreds and thousands of minds to higher ideals. Our Sunday School of the Second Bethlehem Baptist Church is with you in every way and will share our part. I had our Sunday School to subscribe for the Union-Review. I am trying to have the members of the Second Bethlehem Baptist Church School to read the importance of the Union-Review, the Roster of the National Convention.

I close by saying sincerely yours in Christ, Stephen Young, 1318 Schnack Street, Alexandria 12, La.

How long is His love? Without end or beginning,
Eternal as Christ and His life it must be,
For, to everlasting as from everlasting
He loveth the world and He loveth me.

FELT ON TIME & LATE BANNERS
Beautifully Designed
Double Face. Size 11 x 14

TWO IN ONE Price $1.00

Good Morning
Sorry You Are
LATE
Glad To See You

Reverse Side Reads As Above

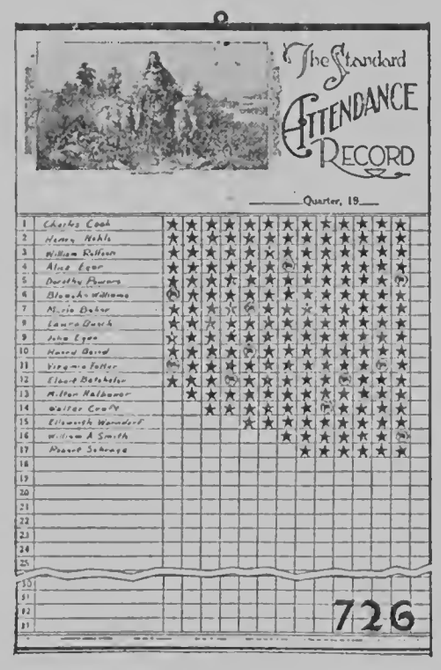
FELT CLASS NUMBERS BANNER
FOR CLASSES FROM
No. 1 to No. 16

Size 11 x 14, ready to hang
Price 80 cents each

TEACHER'S SUNDAY SCHOOL CLASS BOOK
Space for each pupil's names and addresses with record of attendance.
6c each, 72c dozen

BOYD'S CLASS COLLECTION ENVELOPE
For complete class attendance, records of pupils and visitors for each quarter.
35c dozen

VISITORS CARDS
Space for full information as to persons visiting your Church Worship Services, at 1c each for 90c a hundred.



ATTENDANCE RECORD

Attractive Wall Chart in Full Color
Standard Attendance Record
No. 726. Space for 33 names

Improve attendance and add interest in your children's classes by using this beautifully colored wall chart, in colors at the top of the chart. Then the thirteen small squares opposite the name spaces are for recording the child's attendance or record for the thirteen Sundays in the quarter. It is suggested that little gold stars be used to indicate present, red for absence, blue for out of town, and flag seals for sickness. Price of these stars, gummed is 15c a box of 100 of one color. Price of Attendance Record is 35c.

Five Small Children Saved

17-Year Old Boy Scout, Wm. Jackson, Jr., Was Hero

The VFW Scholarship Consisting of $500 And A Gold Medal Awarded For Service

New York, N. Y.—William Jackson, Jr., 17-year-old Scout of 102 Hill Street, Columbia, Mo., who with three other Boy Scouts saved the lives of five small children from burning to death in their home, is the winner of the 1948 Veterans of Foreign Wars Scholarship, it was announced last night, Wednesday, by Dr. Eibert Fratwell, Chief Scout Executive of the Boy Scouts of America.

The V. F. M. scholarship, consisting of $500, and a gold medal, is awarded annually to an outstanding Boy Scout of First Class rank or higher, between 15 and 20 years old, who has previously received a life saving award of the Boy Scouts and who has demonstrated Scout character, leadership, good scholastic ability and unselfish service to others.

Presentation On Sept. 2

Ray H. Brannaman, Commander-in-Chief of the Veterans of Foreign Wars, will present the $500 scholarship check and gold medal to young Jackson next Thursday, Sept. 2 at 2:45 p. m., at the Kiel Auditorium in St. Louis, during the national encampment of the veterans' organization.

The Negro had received the Gold Honor Medal from the Boy Scouts for his part in the rescue. He represented last year's 47 Boy Scout heroes in a smbolic ceremony at the National Council Meeting of the Boy Scouts in May 1947 in New York.

The four Boy Scouts, all Negroes, were honored for saving the five Glascow children, the eldest five years old, when fire destroyed their home on October 10, 1946, while their mother was away on an errand.

Hubert Stapleton also received the Gold Honor Medal while Augustus Chumley and Burton Richardson received Certificates for Heroism.

The Scouts, returning home from football practice, came upon the blazing dwelling. Finding the front door locked, they broke a window. Scouts Jackson and Stapleton entered the house and passed two children through the window to the other Scouts.

Heavy smoke forced the two Scouts to leave after they tried to force the locked door of a room where they thought there might be other children. They tried again a few minutes later and forced the door open but the smoke and heat halted them. Then crawling on the floor they saw the legs of a crib, when they heard the cries of other children.

Enter Smoke-filled Rooms

Jackson felt around in the smoke and grabbed one child by an arm and another by a leg and ran with them out of the house. They still heard another cry. Stapleton entered the smoke-filled room, found his way to the crib and came out with the fifth child, an infant. Then to make certain, all four Scouts crawled into the room again, felt everywhere but found no one else.

Scout Jackson averaged Grade "A" in his senior year at Douglass High School, Columbia, Mo., this year. An honor student, he was president of his sophomore class, a member of the school band, and a letterman in football and basketball. He also helped to edit his school paper.

Active in Church Work

Jackson was president of the Youth Group of the Baptist Church he attends regularly and is a member of its choir. He was secretary of the Church Youth Conference held in Kansas. As a "good turn" he often cleans the church yard.

He took a leading part in a Scout show to raise funds so that his Troop could attend summer camp where he was a leader. He appeared in numerous school assembly programs and before the Kiwanis Club at Moberly, Mo., to promote Scouting.

He directed traffic before and after school to make crossing streets safe for young pupils. He gave blood for the war effort and once for a dying girl. He helped to oil streams to comgat polio and once averted a possible accident by reporting an open sewer to city officials.

We Live On Steel

The side of the steel picture which is most frequently presented to the public is concerned with shortages. It is high time we recognized some of the reasons for shortages. The causes lie in the changed manner of living and working of the American people.

Farming is a fine example. Not so long ago the horse and wagon were agriculture's main motive power. Now we have mechanized agriculture. The farmer's work is done with a long list of machines and tools, all of which involve steel—from an electric transformer to a big tractor. Steel is the very basis of present day agricultural techniques. Here is one striking illustration of why the demand for steel has increased. Farm labor scarcity has caused the use of steel in countless appliances to maintain production.

The same thing is true throughout industry. Motors, the electric utilities, the oil industry, farm equipment manufacturers, makers of household labor-saving devices—all are expanding to meet an enormous and growing demand. Heavy industry, light industry, and consumer activity alike want steel in record quantities.

Steel is expanding, and a billion-dollar building program has been underway for some time. Steel has been plagued with strikes in its own and in related industries, such as coal which cost the country vast tonnage. Its capacity is at a record peacetime level. We're hungry for steel because of a pent-up demand of unimaginable proportions.

USDA Announces 12 Percent Increase For Louisiana Sugarcane Workers

The U S. Department of Agriculture has announced a 12 percent increase in the minimum wage rate to be paid non-harvest sugarcane workers this year by growers in Louisiana who apply for payments under the Sugar Act of 1948.

The Sugar Act requires, among other conditions of payment to growers, that all persons employed on a farm in the production, cultivation, or harvesting of sugarcane be paid in full at rates not less than those specified in the determination. Minimum harvest rates will be determined prior to the harvest season.

This year's basic minimum rate for adult male workers, doing ordinary unskilled labor, is $2.90 per day, an increase of 12 percent over the 1947 minimum wage rate. A similar increase also is in effect for other classes of non-harvest work.

As in former years, the determination also provides that producers must furnish to laborers without charge the perquisites customarily supplied, such as a habitable house, medical attention, and customary incidentals.

A minimum wage rate also has been announced for work in connection with the 1948 California sugar beet crop.

How deep is His love? Oh as deep as man's sinning,—
As low as the uttermost vileness can be;
In the fathomless gulf of the Father's forsaking
He died for the world and He died for me.

Thirteenth Annual Conference Of Catholic Students

Resolution Pledges Support of Upwards of Three Millions to Work for Greater Social Justice for American Negroes

Notre Dame, Ind. Aug. 30.—Upwards of 3,000,000 Catholic students in the United States were pledged to work for greater social justice for American Negroes in resolutions adopted at the closing sessions yesterday (Aug. 29) of the thirteenth national conference of the Catholic Students' Mission Crusade.

Held at the University of Notre Dame, the four-day conference was attended by 3,600 student delegates representing Crusade units in thousands of American communities. Several hundred Negro delegates had prominent parts in the conference, which also was the largest missionary meeting ever held in the United States.

Introduced by Robert Smith Shea, Executive Secretary of Xavier University, New Orleans, La., the resolutions on the Negro held that "prejudice and unjust practices against Negroes are based fundamentally upon ignorance of the history of this group of Americans and a lack of regard for the Christian ideals which demand recognition of the God-given rights of all human beings."

The Crusade resolution also went on record as recommending not only the continued general study of the history of American Negroes, but also a special study of unemployment, housing and health conditions of Negroes in each area where the Catholic Students' Mission Crusade has a unit, with the view of helping to remedy unsatisfactory conditions.

Another resolution called upon Catholic students' "to conform their influence in Catholic schools, that, where legally possible, such institutions be brought into conformity with the mind of the Catholic Church by accepting properly qualified Negroes not only as day but as resident students."

This resolution also pledged Crusade members that "where legal restrictions require separate educational institutions for Negroes, members of the Catholic Students' Mission Crusade will exert their efforts towards securing equal facilities for the Catholic education of Negroes."

In addition the resolution urged Negro Catholics to "take advantage of the many opportunities for education offered them by Catholic institutions, with the aim that they themselves become Catholic leaders among their own people in winning them to Christ and obtaining for them full recognition of their rights as American citizens."

Highlight of the conference was an International Mass celebrated yesterday morning for the delegates in the huge Notre Dame Navy Drill Hall by a Negro priest, the Rev. Harold Perry, S. V. D., of Lafayette, La. A Chinese priest, the Rev. Augustine Tseu of Nanking, China, was deacon, and the Rev. Peter Ryang, a Korean priest now studying in Celevland, Ohio, was subdeacon. The Mass illustrated the universality of the Roman Catholic Church which has communicants in every civilized part of the world.

Father Perry, in addressing one of the conference sessions, stressed the fact that "more and more Negroes are turning to the Catholic Church as the true church of Christ." He urged that more mission schools be built and more priests, brothers and sisters assigned to work among Negroes.

"The Catholic young people of the United States, especially high school and college students," Father Perry added, "have taken a very particular interest in the work of the Negro missions. They also have been directly responsible for much of the progress in interracial relations in recent years. They can continue to further the work of the Negro apostolate by prayer, contributing to the missions, religious vocations for work among Negroes, personal Christlike attitude toward Negroes, real efforts to have each Catholic school opened to Negroes, greater participation in interracial student councils and study clubs, and continued efforts to have all Catholic Youth Organization leagues, teams, athletic games and contests open to all Catholic youth."

Sister Consuela Marie, S. B. S., of Cornwell Heights, Pa., told of the educational work for Negroes by the Sisters of the Blessed Sacrament, founded in 1891 by Reverend Mother M. Katherine Drexel, member of a leading Philadelphia family. Xavier University was started by this order in 1925 and since then has become a leading Negro educational institution, holding a Class "A" rating from the Southern Association of Colleges and Secondary Schools and the American Medical Association. Xavier graduates, she added, "are today maintaining honored and respected livelihoods in every walk of life."

Among other speakers at the conference were two Xavier students, Miss Lois Gonzales of New Orleans, La., and Creevy Clark of Chicago.

American Catholic students also were pledged by their delegates at the conference to help safeguard the American way of life by a more vigorous application of Christian principles to education, government, race relations and other fields. Speakers urged all Americans who believe in God to unite to combat the evils of secularization, or the elimination of God and morality from American life.

The worse the carpenter, the more the chips.

Coffeemaker Is Most Used of All Kitchen Utensils

Davis, Calif (G)—The coffeemaker is the kitchen utensil most often used by the American housewife it was found in a survey conducted in a cooperative project in three states, California, Nebraska and Rhode Island. The survey for California was conducted and directed by Dr. Jean Warren, assistant professor of Home Economics at the University of California College of Agriculture.

The results which were basically the same in the Western, Eastern and Midwestern states ought to be important not only to a manufacturers and retailers, but also to the homemakers themselves.

Next to the coffeemaker house-the frying pan, 10 to 12 inches in diameter. A smaller 8-inch frying pan came in tenth. On the other hand, the 1 quart saucepan made third place, while bigger saucepans lagged behind in sixth and eighth position. The pancake turner was fourth and the bread knife fifth. The lowly dishpan ranked seventh, the medium-sized egg beater ninth.

Far back among the also-rans were the baking utensils, which may be an indication that farm homemakers do less baking than formerly. Dr. Warren and her group also made the interesting discovery that family size had no influence in the kind, number and size of utensils.

If we know how much the habit of being thankful might do for us, I am sure we would take time out every day to count up a few of our blessings. When the spirit of thankfulness takes its place in our consciousness, we radiate life from the very center of our being to the world about us. And our very well-spring of life is renewed within us. Anyone who cannot get into the spirit of being thankful should turn to the Psalms of David. There is an ideology that is alive with thankfulness.

—William E. Towne

Eight Scholarship Awards Given By Delta Sigma Theta

ST. LOUIS.—The award of eight scholarships and three special awards, one to a Liberian student, were officially announced to delegates attending the 20th annual convention of Delta Sigma Theta Sorority, on Thursday afternoon. The total scholarships are valued at $5,000, and were decided upon by the National Scholarship Board of Delta which met in Cincinnati in mid-July. Delta's convention continues throughout this week.

The special awards created were:

1. A foreign scholarship for a teacher to study metrods of elementary school education in New York City.

2. The Juliette Derricotte Special Scholarship Award, to be established at the University of Pittsburgh Graduate School of Social Work, for professional training in group work (available to any Delta).

3. A special Delta award for study and participation in the Institute of Race Relations at Fisk the summer of 1949.

The eight Delta recipients for the 1948-49 awards are:

Mary Jeanette Campbell, Epsilon Chapter, Ohio State University, Columbus. Miss Campbell lives in Dayton, Ohio, and will enter Wellesley College this fall to study pre-dentistry.

Miss Verna M. Cotton of Apha Lambda Chapter, North Carolina College, Durham. Miss Cotton lives in Engield, North Carolina, and will enter the Graduate School of Carnegie Institute of Technology, Pittsburgh, to study Library Science.

Miss Charlie Lucille Davis, Alpha Beta Chapter, Fisk University, Nashville. Miss Davis will complete work in musicology for an M. S. legree at Radcliffe College.

Miss Dorthola Frances Grant, Beta Iota Sigma Chapter, Langston University, Langston, Oklahoma. She will study Clinical Laboratory Technology at Meharry Medical College, Nashville, Tennessee.

Miss Grace Williston Parrott, Gamma Theta Chapter, is a graduate of the University of Dayton, Art Department. Miss Parrott lives in Washington, D. C. She will study at the Traphagen School of Fashion in New York City.

Miss Margaret Louise Price of Gamma Gamma Chapter, Philander Smith College, Little Rock, Arkansas. She will complete her work in home economics for the B. S. degree at Philander Smith College.

Miss Bufordyne Westbrooks, Alpha Zeta Chapter, Talladega College, Alabama. Miss Westbrooks will enter the Graduate School of Journalism at the University of Wisconsin, Madison. She is the first Delta to receive the Julia Bumbray Jones Scholarship Award. This award is in memory of Mrs. Jones of the Pittsburgh Courier.

Miss Fay E. Woodson, Beta Lambda Chapter, University of Toledo. Miss Woodson wil complete work for the B. S. degrec in Art Education at Toledo University.

Members of the Scholarship are Miss Dorothy Height, National President, New York City; Mrs. Reber S. Cann, National Secretary, Cincinnati, Ohio; Miss Beatrice E. Penman, National Treasurer, Kansas City, Kansas; Mrs. Ella P. Stewart, elected member, Toledo, Ohio; Miss Naomi R. Cherot, Chairman, Kansas City, Kansas.

A man who had learned to share taxis in Washington went to Boston on business. He jumped into a cab with another passenger at Boston's South station, having overheard the first fare give a destination close to his. He sat back with a cheery smile and, turning to the other passenger, said pleasantly, "My name's Jennings."

"Mine," said the Bostonian coldly, "is not."

Do You Get Along With People?

By H. E. Goodloe)

Man yproblems arise for discussion in the Department of Superintendents of the National Baptist Sunday School Congress. About 80 per cent of the cases presented, the trouble has usually been with the other fellow—what the pastor, teachers, or some members of the Sunday School fail to do. No one has ever come and found any trouble with self.

One fine characteristic of successful leadership is to be able to examine self for some of the weaknesses that may exist in our Sunday school program. Are you a student who constantly examines the old program and looks for new techniques to improve the administration? How is your approach? Are you always on the job working to make yourself broader? God has so planned this great worll that there is always something good around you if you know how to take advantage of it.

This writer was sitting in a hot church not many Sundays ago and picked up a fan and began to read. The contents were so interesting that I pass it on to you.

TEN COMMANDMENTS OF HOW TO GET ALONG WITH PEOPLE

1. Keep skid chains on your tongue; always say less than you think. Cultivate a low persuasive voice. How you say it often counts more than what you say.

2. Make promises sparingly and keep them faithfully, no matter what it costs you.

3. Never let an opportunity pass to say a kind and encouraging thing to or about somebody. Praise good work done, regardless of who did it. If criticism is needtd, criticizt helpfully, never spitefully.

4. Be interested in others; interested in their pursuits, their welfare, their homes and families. Make merry with those that rejoice; with those who weep, mourn. Let everyone you meet however humble, feel that you regard him as one of importance.

5. Be checrful. Keep the corners of your mouth turned up. Hide your worries, pains and disappointments under a smile. Laugh at good stories and learn to tell them.

6. Preserve an open mind on all debatable questions. Discuss, but not argue. It is a mark of superior minds to disagree and yet be friendly.

7. Let your virtues, if you have any, speak for themselves, and refuse to talk of another's vices. Discourage gossip. Make it a rule to say nothing of another unless it is something good.

8. Be careful of another's feelings. Wit and humor at the other fellow's expense are rarely worth the effort, and may hurt where least expected.

9. Pay no attention to ill-natured remarks about you. Simply live that nobody will believe them. Disorlered nerves and a bad digestion are common causes for backbiting.

10. Don't be too anxious about your dues. Do your work, be patient and keep your disposition sweet, forget self, and you will be rewarded.

End.

Ewell Is Bringing Home Olympic Medal

London, England, Barney Ewell, former Star Athlete of Penn State, will take home to the U. S. A. "the bacon," as they say—an Olympic gold medal which he won here during the Olympic Events.

Ewell who hails from Lancaster, Pa., won laurels along with Lorenzo Wright of Wayne University in the 400-meter race. Other American sprinters are Harrison Dillard and Mel Patton.

The Olympic Events held at Wembley Stadium drew several American Negroes including the Track Team of several young women.

Once again America can be proud of another victory brought about by American Negroes.

James E. Gayle Says 2,000 Laymen Will Enroll In Houston

Houston, Texas—James E. Gayle, New Orleans, Executive Secretary of the National Baptist Laymen Convention, announces that the Annual Convention of Baptist Laymen will be held in Antioch Baptist church, during the week of Sept. 8th. This session will be outstanding because of the enlargement of the Department of Christian Education of the Laymen Movement. where more than 2,000 laymen will enroll from the various churches throughout the nation in the Study Course Classes set up for Baptist Laymen.

A feature of this session will be the presenting of the John L. Webb Distinguished Service Award to the layman doing the most outstanding work in his church. Dr. William Holmes Borders will be the Banquet Speaker at the issuing of this annual award.

J. C. McClendon, President of the Laymen's Movement states that great pains have been taken in selection of teachers and lecturers for this educational program. Much interest is being shown ir the annual national artnight, September 10th, at the Antioch Baptist church, 315 Robin Street, where top gospel singers of the nation will appear. Much ists night that will be held Friday thought is given to the objectives of the laymen movement that is, the Old Ministers' Home and the American Baptist Theological Seminary, located at Nashville, Tenn., and the John L. Webb Foundation Scholarship Fund. Awards each year are given to some layman of the denomination that has done an outstanding piece of work in his church or in the field of Religious Education.

The following religious educators who will appear on program are: Dr. Charles L. Dinkins, Nashville; Dr. R. C. Woods, Arkansas; Dr. Roscoe Mitchell, New York; T. J. Upsack, Texas; Rev. John F. Morris, New Orleans;; Rev. G. W. Harvey, Nashville; J. W. Foster, Oklahoma; M. C. Averhart, Mississippi; Thomas A. Dorsey, Chicago; Rev. T. W. Leggins, Denver; James E. Gayle, New Orleans; H. S. Dixon, Georgia; Rev. Gardner C. Taylor, New York; Carl Smith, Kansas City.

New Secretaries For American Bible Society

New York, N. Y.—The Rev. Paul A. Collyer has been elected Assistant Secretary of the American Bible Society for work in the Society's program of Foreign Distribution. He will begin his duties November first.

Mr. Collyer is a Baptist, a graduate of Denison University and Colgate-Rochester Divinity School. In 1940 he went to China as a missionary and was engaged in language study there when the war engulfed him and his family. Their effort to reach home was thwarted in the Philippines where they spent many months in internment. Mr. Collyer's anticipated return to the field was prevented by health conditions in his family.

The American Bible Society announces the appointment of the Rev. Richard Harris Ellington as Secretary of its Northwestern District which cares for the work in the States of Illinois, Iowa, Missouri, Wisconsin, Minnesota and North and South Dakota. Mr. Ellingson will assume his duties on October 1 at the Society's new headquarters in Minneapolis.

Mr. Ellingson is a minister in the Evangelical Lutheran Church and for the past two years has served the Westwood Lutheran church of Minneapolis. Before that for three years he was a Chaplain in the United States Navy. He graduated from Luther College, Decorah, Iowa and from the Luther Theological Seminary in St. Paul, Minnesota.

"Greatest Story" Broadcasts Resume With Biblical Drama Based On Children's Love

New York, N. Y.—Resuming its broadcasts for the third year after a brief summer vacation period, "The Greatest Story Ever Told" will be heard again, beginning Sunday, September 12, at 6:30 p. m., EDT, over the American Broadcasting Company network, with the Biblical drama, "Of Such Is the Kingdom."

The program will be based on the quotation from Mark 10:14, 15, " . . . Suffer the l ittle children to come unto me, and forbid them not; for of such is the kingdom of God. Verily I say unto you, whosoever shall not receive the kingdom of God as a little child, he shall not enter therein." The second program, on Sunday, September 19, will be "Men With the Mark," based on Luke 6:38, and the parable, "The seed is the word of God."

The dramatic impact of these programs, the outstanding radio creation of our time, will be continued along the same themes and patterns used previously in the broadcast. Each Sunday's program will be based on an important teaching of Christ, dramatically illustrated for the radio audience. A symphony orchestra, and a choir, will furnish the background music and incidental choruses. The opening and closing musical selections, so well liked, will continue to be emphasized.

"The Greatest Story Ever Told" will be directed by Henry Denker, who also writes the script. William Stoess is the musical director. Fulton Oursler is the creator and originator of the program.

All broadcasts of "The Greatest Story Ever Told" are heard all over the world, being beamed by shortwave to 57 countries on all the continents.

Recordings of the programs are also available for schools, churches, and similar groups and institutions for use on public address systems or for class study. List of available programs can be secured from Recording Division, American Broadcasting Company, New York, N. Y.

Calcium Found To Improve Many Crops Of Farm

Berkeley, Calif., (G)—Calcium deficiency is one of the reasons why many serpentine soils, soils very rich in magnesium, are infertile. This has been established in experiments carried out by Dr. James Vlamis and Prof. Hans Jenny of the University of California College of Agriculture.

The experiments did not support the theory that chromium, nickle, or cobalt are responsible for poor growth in serpentine soils as has been assumed for many years. Nor was there any evidence found that these clements arc causing the resettc disease in lettuce observed on serpentine soils. While fertilizing the soil with nitrogen and phosphate increased growth it did not cure rosette disease. However the addition of a special form of calcium overcame the disease and improved thc fertility.

Home: The place where we are treated the best, and grumble the most.

PULPIT BIBLES

We are offering the finest quality of Pulpit Bibles at the following prices:

$10 - $15 - $25 - $35

ALL ARE STANDARD SIZE

10½x12½ Large Clear Type

Send all orders to

National Baptist Publishing Board

523 Second Avenue, North

HENRY ALLEN BOYD, Secretary

Nashville 3, Tennessee

Receipts

ICE BOX COOKIES

1 cup brown sugar
1 cup white sugar
1½ cups butter or margarine
3 eggs, beaten
1 cup nut meats, choped
1½ teaspoons soda
1 teaspoon cinnamon
1 teaspoon nutmeg
1 teaspoon salt
4½ cups flour

Cream butter or margarine and sugars. Add eggs. Mix and sift dry ingredients and add with nuts to first mixture. Mix well and then kneed into small rolls. Wrap in wax paper and put in icebox overnight. Cut in thin slices and bake on greased cooky sheets for 10 minutes in a 376-degree oven.

FIG, SWEET POTATO CASSEROLE

14 fig bars or newtons
6 sweet potatoes
1 cup crushed pineapple
3 tablespoons butter

Crumble the fig bars or newtons into small bits. Cover with crushed pineapple that has been drained. Cook sweet potatoes in slightly salted water until they are tender. Peel them and mash thoroughly with butter.

Add the fig bars and the pineapple and salt to taste. Place in a buttered casserole and bake in a moderate oven (350 degrees) for about 20 minutes or until thoroughly hot.

NUT MACAROONS

4 egg whites
½ teaspoon salt
1 teaspoon almond extract
½ teaspoon, vanilla
3/4 cup sugar
3 cups cornflakes, slightly crushed
1 cup pecans, coarsely chopped
1 cup coconut

Add salt to whites, beat to a coarse foam. Add flavoring. Add sugar in 1-tablespoon portions continuing beating until stiff and glossy. Fold in cornflakes, nuts and coconut. Drop from teaspoon onto well-greased baking sheet. Bake in moderate oven (350 degrees) until delicately browned, about 15 minutes. Remove promptly from baking sheet. About 3½ dozen.

LAMB RIBLETS WITH VEGETABLES

3 lbs. breast of lamb
Salt and pepper
4 tbsp. shortening
¼ cup vinegar
¼ cup water
1 can string beans
8 small onions
8 small carrots

Cut into servings. Season with salt and pepper. Brown in skillet with shortening. Add vinegar and water. Place beans, onions and carrots on top of meat. Cook on high heat and when steaming freely, turn to low heat for 60 minutes. Serves six.

LAMB SHANKS WITH VEGETABLES

4 lamb shanks
Salt and pepper
4 tbsp. fat
6 peeled carrots
1 lb. fresh peas
4 tbsp. butter
4 peeled potatoes

Cut shanks into servings. Season with salt and pepper. Brown in fat. Place in cooker with heat high. Place potatoes and carrots over these. Add peas and butter. When steaming freely, turn heat to low and steam.

A combination which gives you colors just as bright as carrots and peas and which satisfies the requirement for a green and a yellow vegetable every day is that of peas and yellow squash. The whole squash are steamed to fork tenderness and served with melted butter to which a dash of white pepper has been added.

Peaches, canned or frozen, take on a new deliciousness in the early spring when menu have become weary. A number of desserts are more tempting if peaches are used in them, and today I have served them around caramel nut ice cream.

CLOCK COOKIES

1-3 cup margarine or butter
1 cup sugar
2 eggs
2 squares unsweetened chocolate
½ tsp. vanilla
1¾ cups sifted flour
¼ tsp. baking soda
½ tsp. salt
¼ cup confectioners' sugar

Cream margarine and sugar together. Add eggs and beat well Add melted chocolate and vanilla. Sift flour, baking soda and salt; add to chocolate mixture and blend well. Pack into 3¾ inch square refrigerator container which has been lined with waxed paper. (Long ends on the waxed paper make it easier to slip dough out.) Chill thoroughly Remove dough from refrigerator container and slice in ⅛ inch thick slices. Place on lightly greased baking sheet, and bake in moderately hot oven (375 degrees F.) 8-10 minutes. Cool. Moisten confectioners' sugar with water to make a smooth paste. On each cookie use a small paint brush or toothpick to paint numbers 12, 3, 6 and 9 in their respective places as on a clock face. Use dots of frosting for missing numbers. Make hands on clock face to reach a few minutes past 12 midnight. Yield: 18 large cookies.

A good accompaniment for them will be a hot fruit punch

CROWN ROAST OF LAMB

2 racks of lamb
Cubes of salt pork
Salt and pepper
Potato stuffing

Have the butcher prepare the crown roast of lamb. Wipe with damp cloth, season with salt and pepper, and place in shallow pan Stick the cubes of salt pork on each exposed bone. Roast. During the last hour fill with mashed potatoes seasoned with onion and brush the top of potatoes with buttered crumbs. To serve remove cubes of pork and replace with cutlet frills. Garnish with garden peas and currant jelly. Allow 30 minutes per pound in 350-degree oven. Allow two ribs per person.

Americans are not much given to eating mutton and think of it only in terms of leg of lamb or lamb chops, and English visitors find it difficult to get mutton chops, one of their favorite delicacies, in our markets. Most sheep here are sold while they are still young enough to be classified as lambs.

There are two types of lamb chops, the rib and T-bone. These are usually served broiled, but they may be sauteed or fried, or they may be served breaded.

There are other cuts of lamb which make good eating: stuffed lamb breasts or a shoulder of lamb rolled and stuffed. Ways of using lamb left from the first serving of a roast include lamb stew, meat pie, broiled lamb patties, or barbecued lamb.

Here are two recipes for serving other cuts of lamb.

ORANGE TARTS

6 baked tart shells
1 cup sugar
1-3 cup sifted all-purpose flour
¼ teaspoon salt
1 cup orange juice
1 tablespoon lemon juice
Grated rind of 1 orange
3 eggs, separated
6 tablespoons sugar

This filling goes into baked tart shells but because the merringue topping needs cooking, set your oven at 325 degrees or slow.

Sift together 1 cup sugar, flour and salt. Stir in orange juice, lemon juice and orange rind. Beat egg yolks until light and combine with flour-fruit mixture. Cook this over boiling water, stirring occasionally to prevent lumping until thickened, or about 20 minutes. Cool. Fill baked tart shells.

Beat egg whites until stiff and beat in the 6 tablespoons of sugar gradually. Put a large lump of the meringue on top of each tart and bake in slow oven (325 degrees) until meringue is a light brown on top, probably 15 to 20 minutes.

ORANGE BREAD

1 cake yeast, compressed or dry
2 cups lukewarm water
1-4 cup orange juice
1-4 cup grated orange rind
1-2 cup sugar
1 1-2 tsps. salt
3 tbsps. melted shortening
1 egg
4 cups sifted flour (about)

Soften yeast in one fourth cup lukewarm water. To the remaining water add orange juice, rind, sugar, salt and melted shortening. Add two cups flour. Mix well. Add egg and softened yeast. Beat well. Add remaining flour to make a soft dough. Turn out on a lightly floured board and knead until satiny. Place in lightly greased bowl. Cover and let rise in warm place until doubled, about one and one half hours. Punch down. Let rest 10 minutes. Divide into equal parts. Shape each part into loaf. Place in greased 8 1 2 x 4 1 2 loaf pans. Let rise until doubled, about an hour. Bake in moderately hot oven (400 degrees F.) about 45 minutes. If desired, brush slightly cooled loaves with confectioners sugar icing. Yield: two loaves.

Another bread that will give springtime meals a special sparkle is Sally Lunn, a hot bread that originated in the resort town of Bath, England, nearly two centuries ago. Sally Lunn can be made with or without yeast. Either recipe will make a fine choice for some Sunday evening entertainment, with preserves and tea or coffee.

SALLY LUNN (NO. 1)

2 cups flour
2 tbsps. sugar
1 2 tsp. salt
1 scant cup milk
3 tbsps. butter
1 cake yeast
1 4 cup warm water
1 egg

Sift flour, sugar and salt. Warm milk and pour over butter. Stir in flour, add yeast after it is dissolved. Beat egg separately and add to mixture. Let stand until double its bulk. Brush with melted butter, sprinkle with sugar and bake in moderat oven. Serve warm cut into squares.

SALLY LUNN WITHOUT YEAST (NO. 2)

2 eggs
1 scant cup sugar
3 cups flour
4 level tsps. baking powder
1 cup sweet milk
2 tbsps. butter

Cream butter, add sugar and blend thoroughly; beat yolks of eggs and add to sugar-butter mixture; sift flour with baking powder and stir into first mixture alternating with milk; fold in beaten egg whites last. Bake in flat pan in 350 degree F. oven. Serve hot with butter.

BAKED BROWN BREAD

2 3 cup sifted flour
1 tsp. soda
1 2 tsp. salt
1 cup corn meal or whole wheat flour
1 egg
2-3 cup rich milk mixed with 2 tsps. vinegar.

Sift dry ingredients together. Beat egg. Add soured milk and molasses. Stir egg mixture into dry ingredients and beat until thoroughly smooth. Pour into greashed loaf pan. Bake in a moderate oven (350 degrees F.) until firm, about 45 minutes. Yield: one loaf. Evaporated milk may be used in this recipe.

NUT BREAD

1 egg, beaten
1 2 cup water
3 4 cup rich milk
2 1 2 cups sifted flour
1 2 tsp. salt
1 2 cup sugar
1 1-3 tbsps. baking powder
1-2 cup chopped nuts
1 2 cup chopped raisins

Mix egg, water and milk. Sift together the flour, salt, sugar and baking powder. Add nuts and raisins. Stir egg mixture into flour mixture. Flour should be only just dampened; the batter is supposed to be lumpy, so do not overmix. Pour into greased loaf pan. Bake in moderate oven (350 degrees F.) about 50 minutes. Yield: one loaf.

MEAT BALLS WITH NOODLES

1-2 cup bread crumbs
3-4 lb. ground beef
1 egg
3 tbsp. grated onion
1 tsp. salt
1-4 tsp. pepper
2 tbsp. fat
3 tbsp. enriched flour
1-2 tsp. salt
1-8 tsp. pepper
2 cups milk
1 tbsp. salt.
3 qts. boiling water
4 ozs. broad noodles

Combine bread crumbs, ground beef, egg, onion, 1 2 teaspoon salt and 1-4 teaspoon pepper. Mix thorouhly and shape into small balls about 1 1-2 inches in diameter. Heat fat in skillet. Add meat balls and brown well on all sides. Remove meat. Add flour, 1-2 teaspoon salt and pepper to fat remaining in skillet, mixing thoroughly. Gradually stir in milk and cook until thickened, stirring constantly. Add meat balls to sauce. cover and cook slowly about 15 minutes or until meat is thoroughly done. While meat balls are cooking, add 1 tablespoon salt to actively boiling water. Gradually add noodles and boil until tender (about five minutes). Drain and rinse. Arrange noodles and meat balls on hot platter. Serve with gravy.

TASTIER CEREAL

Added interest can be given to the morning cereal if a few raisins are cooked in it. They give added nutrition, too. If a spicy touch is desired, try adding amout a half teaspoon of cinnamon and 1-8 teaspoon nutmeg when cooking enough oatmeal for 4 to 6 servings.

SALMON RAREBIT ON TOAST

3 tablespoons butter
3 tablespoons flour
1 teaspoon salt
⅛ teaspoon pepper
⅛ teaspoon paprika
2 cups milk
1 cup grated American cheese
1 pound can salmon
1 tablespoon lemon juice

Melt butter in saucepan, add flour and seasonings and blend. Add milk while stirring and cook over low heat until smooth and thick, stirring occasionally. Add grated cheese, stirring to blend. Drain salmon, remove bones and skin and break in small pieces. Fold into sauce with lemon juice. Serve on hot buttered toast. Serves six.

FRANKFURTERS IN BARBECUE SAUCE

4 tablespoons vinegar
2 tablespoons flour
1-2 cup finely chopped onion
2 teaspoons salt
2 teaspoons paprika
1-2 teaspoon pepper
2 teaspoons chili powder
4 tablespoons brown sugar
3 tablespoons Worcestershire sauce
1-2 cup catsup
12 large skinless frankfurters

Add vinegar gradually to flour to make a smooth paste. Add onion salt, paprika, pepper, chili powder, brown sugar, Worcestershire sauce and catsup to make a sauce. Mix well. Pierce frankfurters with a fork and arrange in 3-quart casserole. Pour sauce over frankfurters, cover and bake in a moderate oven (350 degrees; about 30 minutes. Makes 6 servings.

CHICKEN GUMBO

1 chicken
1 doz. pods okra
3 ears of corn
3 qts. water
6 large tomatoes
2 Irish potatoes
1 onion

Cut chicken into frying pieces. Put four slices of bacon in heavy skillet, fry, remove bacon, dredge chicken in flour and saute in bacon grease. Pour quart of boiling water over chicken and cook until meat falls from bone. While chicken is cooking, boil vegetables in two quarts of water until done. Add cooked chicken and liquid to vegetables, thicken, season and serve. Serves eight.

SPAGHETTI LOAF WITH MUSH ROOM SAUCE

1 tbsp. salt
3 qts. boiling water
4 ounces spaghetti
1 12-ounce can table ready meat
3 eggs, well beaten
1 cup milk
2 tbsp. grated onion
1-4 cup chopped green pepper
2 tbsp. chopped jarsley
1 tbsp. Worcestershire sauce if desired
1 tsp. salt
1-8 tsp. pepper
1-4 cup buttered bread crumbs

Add one tablespoon salt to actively boiling water. Gradually add spaghetti and continue cooking until tender, about 12 minutes. Drain and rinse. While spaghetti is cooking, grind meat, add eggs, milk, onion, green pepper, parsley, Worcestershire sauce. salt and peper. Fold in spaghetti. Pour spaghetti mixture into greased 1 1-2 quart casserole or loaf pan. Sprinkle bread crumbs on top of spaghetti mixture. Place baking dish in a pan of hot water. Bake in moderate oven (350 degres F.) about one hour. Slice and serve hot with mushroom sauce.

Mushroom Sauce

1 10 1-2 oz. can mushroom soup
1-2 cup milk

Combine soup and milk in the top of a double boiler and heat thoroughly.

Let water run gently over cooked macaroni, spaghetti or noodles in a colander to "blanch" them. If they are to be served hot, use hot water. If to be used in cold dishes, such as salads, or when prepared ahead of time for later use in combination in recipes use cold water

ONIONS STUFFED WITH HAMBURGER

4 large onions, parboiled
½ pound ground beef and veal mixed
½ teaspoon poultry seasoning
1 teaspoon bread crumbs
Salt
Pepper
2 tablespoons butter or margarine

Scoop out the center of the parboiled onions. Chop finely. Add remaining ingredients (except butter or margarine) and mix well. Brush inside of onion cups with part of the buter or margarine mixture. Dot tops with remaining butter or margarine. Place in pan with small amount of water, covering bottom. Bake 25 minutes in a 400-degree oven.

FLUFFY LEMON CREAM

3 egg yolks, slightly beaten
¾ cup granulated sugar
⅛ teaspoon salt
1 lemon grated rind and juice
1 tablespoon boiling water
3 egg whites, stiffly beaten

Mix egg yolks, sugar, salt, lemon rind and juice, and water in top of double boiler and stir over hot water until sugar is dissolved. Continue cooking, stirring constantly until smooth and thick. Fold mixture into stiffly beaten egg whites. Place in serving dish and chill. Serve garnished with whipped cream. 6 Servings.

Guaranteed Living: The fellow in jail has a guaranteed job. He is also guaranteed a fixed annual "wage." He is guaranteed food and shelter. If he is in for life, he is guaranteed an old-age pension.

People who want everything "guaranteed" in this world have to take the surrender of freedom that goes with it. The only organization that can "guarantee" is the government. and the only way the government can guarantee is to put us all in a vital chain gang and divide the potatoes we raise.

Personally, I'll take freedom and the risks that go with it.

—Don Herold

At school for the first time, the small boy started to sob bitterly.

"What's the matter, Willie," asked the teacher.

"Please, Miss. I don't like school, and I've got to stay here till I'm fourteen."

"Don't worry about that, said the teacher. Look at me. I've got to stay here till I'm sixty-five!"

On the Air

REV. MELVIN EARL, D. D., Pastor of the St. Paul Baptist church, San Francisco, Calif., who will broadcast over Station KWBR, Saturday, September 11th at 9 p. m., (PST).

San Francisco, Calif.—The Rev. Melvin Earl, D. D., pastor of the St. Paul Baptist church is conducting ONE HOUR Radio Broadcast over Station KWBR for the National Baptist Convention. The Broadcast will be at the Mt. Zion Baptist church, Saturday, Sept. 11, 1948, at 9 p. m., (PST.) Rev. Earl will have with him a chorus of 40 voices. He will also interview various leaders from all parts of the country. This will be a great asset to the National Baptist Convention on the West Coast. Rev. Earl organized the St. Paul Bapt. church in San Francisco in 1946, and has a progressing membership and a great following. He is one of our future oncoming ministers.

He was born in Texas, but is now living in California and has for the last 23 years. He began his ministry in California and received his knowledge of Theology and Bible Learning in Los Angeles, Calif. It has been proven that he is an organizer and builder. We are glad to have this young minister with us in our great work. Let us pray that whatever field he works in will be a blessing to all mankind. He and the St. Paul Bapt. church of San Francisco along with his many friends and followers will do their part to welcome all to the National Baptist Convention in Oakland California.

Tibetans' Language Is Being Taught At California U.

Berkeley, Calif., (G) "All seemed strange to us in America," Tsepon Shakabpa, leader of the first Tibetan trade delegation ever to visit the United States said recently, until we came to the University of California.

The Berkeley campus of the University seemed familiar to the Tibetans, they said, because it was there that they heard their own language spoken by Prof. Ferdinand Lessing, Agassiz professor of Oriental Languages.

The Tibetans, who spent two afternoons on the campus as the guests of Prof. Lessing, made records in their language for use in the Department's Tibetan language course.

"It was an extremely rare opportunity," Prof. Lessing said "to get these records of spoken Tibetan. Also the delegation has promised to assist the University in obtaining Tibetan books which we have not been able to get before."

The University's course in the language concentrates mostly on written Tibeta and was the first course of its kind to be offered in American Unversity.

The Bell Tolls

By Leonard H. Bell

THIS IS "STATES RIGHTS"

The welkin is ringing today with the political garrulity of dusty Southern egotists, who pathetically plead their case for "States Rights." In their usual unctuous manner they have completely forgotten the existence of such a divine thing as HUMAN RIGHTS.

Recently a 13-year-old Negro boy escaped from slavery in Louisiana, where he had been held as a branded slave.

Kentucky educators devised a plan last week to escape a Supreme Court ruling on equal educational facilities by having the professors of the University act as "tutors" to Negro students who desire subjects or courses not taught at the Kentucky State College.

Virginia in order to keep the Negro in economic, social and psychological slavery has laws of every sort detrimental to the Negro and his welfare on its statue books, even one law defining a "Negro".

In Memphis, Tennessee two white policemen brutally beat a 34-year-old Negro maid with blackjacks while taking her to jail.

These are some of the reasons that certain Southern dialect comedians are making the welkin ring for their lovable "States Rights." They would like to continue their sadistic pursuits.

Mt. Zion Baptist Sunday School Children Saw R. H. Boyd Statue

Young People's Department Of The Church Pastored By The Rev. J. W. Watkins, Visited The National Baptist Publishing Board's Plant On Tuesday

Teachers Of The Departments, And Instructors Of The Several Grades Carried Them In Busses To The Plant Established By The Late Baptist Leader

On Tuesday morning of this week the children from the Mt. Zion Baptist Sunday School of the church located at 11th Ave., and Jefferson St., under the pastorate of Dr. J. W. Watkins, visited the National Baptist Publishing Board, located at 2nd Ave., N., and Locust St. The children were under the direction of their teachers, departmental leaders and instructors, Mrs L. Landers, daughter of the late R. H. Boyd, Mrs Loretta Green, Mrs. Ella Mae Freeman, Miss Marivia Hayden, Miss Birdie Williams, Mrs. Pearlene Cheatham, Mrs. J. L. Stinson.

Upon their arrival at the plant, they were greeted by Sceretary Henry A. Boyd, the oldest son of the late R. H. Boyd, Miss S. B. Wilson, the office secretary, Mrs. Marguerite Reed, Mr. H. B. Haley, Mrs. Annie Talley, Miss Hattie Butcher, Mrs. Ellen Turner, who acted as guides. The two executive officers of the plant, Secretary Boyd and Miss Wilson shook hands with each of the children, then divided them into groups and the guides took them through the plant They stood long and gazed at the statue of the late R. H. Boyd, as they were told of his work, his worth, his rise from slavery, that he did not attend school until he was forty years old. The guides told them he established the plant that they were going through, that he was the first president of the Citizens Savings Bank and Trust Company, the first president of the Nashville Globe Publishing Company. the National Baptist Church Supply Company and the National Baptist Union-Review. After this, they began their trek through the six buildings occupied by this mammoth printing and publishing plant known throughout the world.

They went through department after department, their guides explained to them the work being accomplished, whether it was book keeping, stenography, typewriting, typesetting. press work, bookbinding, cabinetmaking, editorial work, proofreading, first and second class mailing, assorting and distributing stock in the raw and following it through to the finished product, or whether it was in the book sales Department. These children took in every word that the guides were telling them. It made an indelible impression upon them, and from their attentiveness one could see that they were having day dreams about the time when they too would grow up into manhood and womanhood so they could do this same kind of skilled labor.

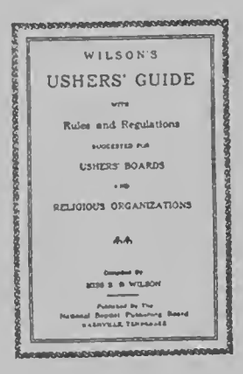
The following are the names of some of the chilren that could be secured, as many of them were so anxious to see that they would not even stand still, they wanted to go, and go they did. throughout the plant.

Anna Hardge, Clarallease Stratton, Mattie Eva Mathis, Charles Green, John Henry Red, Mary Elizabeth Mathis, Nadine Fizer, Jean M. Davis, Dorothy Ann Cheatham, Emma Jean Harvey, Jeanette Tompkins, William R. Bailey, Ransom S. Ritter, James Edward Hawkins, James Bigsby, Lorenzo L. Hayden.

Constance Nixon, Hazel Cole, Paula Baker, Annette Fields, Patricia Fields, Geneva Thompkins, Rosetta Moore, Vera Hayden, Ruth Herman, Miriam Gayles, Sirley Larkin, Clarissa Bigsby, Carolyn Hickman, Marjorie Fizer, Gwendolyn Moore, Barbara Bailey.

USHER GUIDE

WILSON'S



WITH SUGGESTED RULES AND REGULATIONS

We recommend it, because this book is simple in its presentation, but large enough in its scope to help ushers individually or collectively.

PRICE $1.00 per copy

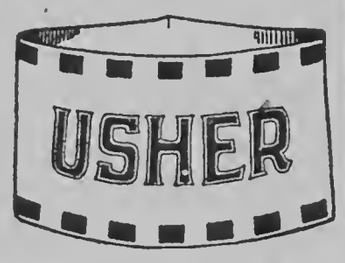
USHER BADGES

Are Made To Order

THIS BADGE IS A BEAUTY

Two colors of ribbon used, one side for general use, other for In Memoriam, one side printed in Silver, the other side is printed in Gold. In the bar we will place station of officers (not name of person) On face of badge any wording desired, including name of church. Always give full information. Price $1.50 per badge. No. C. O. D. Orders.

USHERS' ARM BANDS



Stenciled in white made of blue wool felt. 4 inches wide.

Price 50c each

Blue Felt Usher Arm Band, with sewed white letters of white felt. Very durable and attractive.

Price $1.00 each

OVAL SHAPED USHER ARM BAND

These Ushers' Arm Bands are very attractive; made of high-grade felt material, in colors red, blue and green, each with white letters, and elastic band to fit around the arm. Size 6½x4¾ inches, 30c each; $3.00 a dozen.

USHER STAR

A silver five pointed two inch STAR word USHER engraved in black, with hook clasp pin.

PRICE $1.00 EACH

Lou Swarz Rated Ph. D. In Comedy

St. Louis, Mo., (G)—Lou Swarz, Actress-Comedienne, of New York City, spent a few days here, having come for the funeral of Kate Boone Harris, the only sister of her deceased mother. Amanda Boone Schwartz.

Miss Swarz has steadily won her way into the hearts of all in the theatre as well as those who have heard her, she is being called the "PHD Commedienne," because of her high- class comedy sketches which always keep her audiences in sitches, many say Miss Swarz mnst have a Ph. D .in comedy.

Due to her New York ventures the actress is combining her talents with two of the country's most progressive business women, Misses Rose Morgan and Oliva Clarke in opening a Charm Studio.

Miss Swarz left city immediately after the funeral services of her aunt.

Definitions

Boy: Merely a noise with dirt on it.

Honesty: The best policy because it has so little competition.

Steam: Water gone crazy with the heat.

Cleanliness: Cleanliness is next to godliness, but in childhood it's next to impossible.

Youth: The first fifty years of your life—the first twenty of anyone else's.

Public Speaking: The art of diluting a two-minute idea with a two-hour vocabulary.

Fortune Hunter: The man who seeks a girl for her pa value.

Fishnet: A lot of little holes tied together with string.

GI Education To Be Made Easier By New VA Ruling

Washington —(G) The Veterans Administration has now torn away some of the red tape of the registration procedure for the G. I. Bill's training and education program.

On Sept. 1 veterans will be required to file certificates of eligibility at least a month in advance of training.

Under the revised system a VA claim number will be assigned as each certificate is received and the Administration will be ready in advance, to handle the veteran's claim for subsistence allowance at once.

Too, each veteran will be given two copies of his certificate for presenting to the school or training institution.

Eddie Johson Wins Tokyo Bout

By Global's London Representative

London, England—Eddie Johnson, former Kansas City Boxer, who is now stationed in Tokyo, won from Basilio Alvez of Uruguay in the Boxing Eliminations during the Olympic Games here in London.

Both fighters were Negroes, and although many spectators seemed displeased at the decision, Johnson stated that with his winning the first and second rounds, and although losing the third, anywhere in the world, he would have been acclaimed the winner.

Cotton Mechanization Research Given Priority for Next Year

Research leading to the development of more satisfactory equipment for mechanizing the production and harvesting of cotton and improved equipment and techniques for ginning it were given top priority for consideration in fiscal year 1949 under the Research and Marketing Act.

This action was taken recently by the Cotton and Cottonseed Advisory Committee of R. & M. A. The committees emphasized that research relating to the mechanization phases of cotton production be speeded up as much as possible, and that ginning research as it relates to mechanically harvested cotton be expanded immediately

The committees agreed that all cotton research underway be continued, and that an additional specialist be assigned to study foreign markets for cotton. In line with this recommendation, Dr. Ide P. Trotter, director of the Texas State Extension Service, has been loaned to the U. S. Department of Agriculture to study conditions in the Far East affecting foreign markets for U. S. cotton.

In the field of marketing, new lines of research work given the greatest emphasis by the committees were: (1) Development of better equipment and methods for the physical handling of cotton bales in marketing channels; (2) improvement of marketing and storage facilities and equipment; (3) development of methods of eliminating or controlling fires at gins, and for detecting fire-packed bales; and (4) provision through demonstration, so far as possible, a dependable and continuous supply of one-variety planting seed to farmers at a reasonable cost.

To expand the utilization of cotton and cottonseed products, research was recommended which would find a rapid method of measuring crease resistance of cotton fabrics and for treating these fabrics chemically so that they will drape more satisfactorily and thus improve their marketability. The recommendations also include the planning and construction of more adequate buildings and facilities for cotton and cottonseed research at the Southern Regional Research Laboratory at New Orleans. Plant breeding and soil studies are to be made in the promotion of prduction.

Profitable TVA Farming System to Be Discussed in Broadcast

The profitable Tennessee Valley Authority farming system, under which an income goal of $100 an acre has been set for white and colored farmers of the area, was discussed over Station WAPI of Birmingham, Ala., Saturday, May 1, 1:30 p. m. CST, reports Dr. J. R. Otis, Negro State Extension leader of Ala.

Participants on the program were a farmer, Wilbert Warren, of the TVA region, a colored county agent, C. A. Williams, and the assistant extension editor for the Negro division of the Ala., Extension Service, Charles E. Trout. They described how the $100 per acre system works.

Among other things, the group pointed out how the system provides for a balanced cotton, dairy, and hog program in some north Ala., counties. For example take a farmer with 80 acres. Under the system, he would be advised to plant 20 acres to cotton, 20 to corn, 10 to clover followed by grain sorghum, 10 to oats followed by clover, 10 to permanent pasture for a small dairy herd; five to alfalfa and five to grazing range for five brood sows.

Such a farming program, carried out with proper soil conservation methods, would produce an income of $3,000, or $100 per acre, says Dr. Otis. About $3,000 of this would come from cotton, $2,500 from dairying, and $2,500 from hogs. Besides it would provide a good diet for farm family. Dr. Otis says that 80-acre farmers under the program would milk 10 cows and raise 60 head of hogs for market.

15 Louisiana Farmers Form Tractor Co-op

In an effort to compete with larger farmers in reducing labor costs, 15 colored farmers af Louisiana have formed a tractor co-operative, according to a report received by the U. S. Department of Agriculture from the Louisiana State Extension Service.

Each of the 15 farmers put $100 in a pool and made the down-payment on a $3,000 tractor equipped with trailer, double disk, and other attachments. The co-op has employed a man to operate and maintain the tractor and has developed a farm-by-farm schedule of operations with tractor power. Co-op members have agreed to pay $1.50 per acre for land disked; non-members will be charged $3 per acre. All monies will go into the treasury to pay the notes on the tractor, and to cover cost of operation and maintenance.

Employment Opportunities Open for Persons Trained in Marketing

How to get more white and colored personnel trained at our colleges and universities for about 3,500 agricultural marketing jobs which Federal and State agencies expect to fill within the next five or six years was a problem discussed here recently by a committee representing Land Grant Colleges and the U. S. Department of Agriculture.

The committee's recommendations, which were made to the colleges and universities, included the need for placing greater emphasis on some courses now being offered, and for introducing new courses.

E. A. Meyer, administrator of the Resarch and Marketing Act, pointed out at the committee meeting that the Federal government, State departments of agriculture, State extension services and experiment stations, and private industries are looking for men who can do marketing jobs. The demand will continue, he said. Federal and State agencies receiving R. & M. A. funds expect to hire about 700 trained men and women each year for the next five years, or a total of 3,500 persons.

Marketing, as discussed by committee, needs in some of its phases men and women trained in engineering, economics, business administration, nutrition, home economics statistics, chemistry, bacteriology, entomology, and related fields of research. It was pointed out that an agricultural background is desirable, but not always required.

Meyer says that as in other expanding fields, opportunities for advancement should be more rapid in marketing-consumption than in most other types of agricultural work, because of the likelihood of a continued heavy demand by private industry for those trained in the many phases of marketing. Probably half of the 3,500 recruits will be those with advanced training, a master's or a doctor's degree or its equivalent.

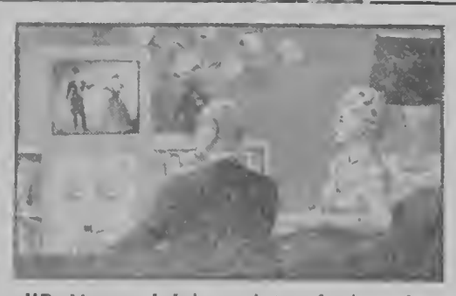
The committee points out that training in marketing will be valuable to graduates who take jobs in teaching, extension work, in private industry, or who farm for themselves. Because of the urgent need for personnel trained in marketing, the committee is urging colleges and universities to offer such courses during their summer sessions

"Security is One Crop I don't Rotate!"

I'M PLANTING STEADY IN U. S. SECURITY BONDS

"That's the big crop I keep after every year. It will pay off in education for my children, improvements in Betty's kitchen, more land and a nest egg for me. And best of all, for every $3 I invest in Savings Bonds I'll get $4 back.

"I know Jae will be ready far callege quicker than you can say 'alfalfa.' I'm earmarking same af my U. S. Security Bands ta send him to schaol in style.



"Betty and I have lots af plans for madernizing aur hame and the farm. It wan't be hard, thanks to the maney we're putting regularly in Savings Bonds.

"I'm looking forward ta plenty af leisure haurs as years ga an. I keep ane batch of my bands in an envelape labeled: 'Things I've always wanted to do.'

"Bigger than anything else my Savings Bonds can buy me is the backing they give ta America's security. It's a case af helping my cauntry . . . and myself."

USDA Announces Final Goals for 1948 Crops and Livestock

Final 1948 farm production goals for most major crops and livestock were announced last week by the U. S. Department of Agriculture. Establishment of goals follows review of recommendations by State USDA councils.

Assuming that the 1948 goals for peanuts, some types of tobacco, sweetpotatoes, and truck crops for processing will be at Department-recommended levels, the acreage goals will total 354 million, or 7.4 million larger than actual acreages in 1947. Livestock goals are somewhat smaller this year than last, but have been set as high as expected feed supplies make feasible.

Gardeners Urged to Read Seed Labels Carefully

Purchasers of seed for lawn or vegetable gardens are urged by the U. S. Department of Agriculture to read the label on the package carefully to find out the percentage of germination and other qualities.

At the beginning of the garden season a year ago, the Department made a survey in 134 stores in the District of Columbia and discovered that many dealers were seliing seed not properly labeled.

The Federal Seed Act of 1939 requires that all seed shipped in interstate commerce must be fully and accurately labeled to indicate the quality of the seed. The label of lawn seed must show the percent of purity, the amount of noxious weed seed, and the percent of germination.

Although the law requires that seeds must have been tested for germination within six months prior to date of sale, the Department survey revealed that many dealers were found to be selling packaged vegetable and lawn seed carried over from the previous season and therefore showing a test date more than six months old. Other dealers were selling from open containers without labeling the retail packages as required by law.

Nashville AVC Favors Ending Army Jim Crow

By Mason McKinney

The executive committee of the Nashville chapter of the American Veterans Committee (AVC) has unanimously endorsed the action taken by President Truman in his recent executive order which calls for the eventual abolition of racial discrimination and segregation in the armed forces.

Chairman Mason McKinney has announced that if world conditions are such as to warrant a peacetime draft, then common sense should dictate that we put an end to the wasteful and ineffective use of our human resources that is currently so prevalent in our armed forces.

This stand by the Nashville AVC chapter supports the position of the national and regional organization of AVC which favors the elimination of segregation and discrimination and the increase of democracy in the armed forces.

$41,255 Now In Defense Fund Of Ingram Family

New York, Aug. 12—Receipt of contributions last week amounting to $289.71 brought the Ingram Defense Fund to a total of $41,255.47, the NAACP announced today. Contributions received last week included $152 from the East Side Ingram Club, Detroit; $12 from the Thrift Twelve Savings Club, Akron; and $5 from the Committee for Civil Rights, Brooklyn.

Hard Working Gentle Bees to Be Reality

Bees that sting less, gather more honey and resist diseasc soon will be available as a result of new discoveries in breeding, Prof. W. A. Price, head of the entomology department at thc Agricultural Experiment Station at Lexington, told a meeting of the Kentucky Beekeepers Association.

Applying methods used in artificially breeding dairy cows and in producing hybrid corn, scientists found ways to control queen mating. Thereby they are working to produce superior honey-makers—bces not so anxious to sting and willing to work harder. They will also produce better pollinizers and bees more resistant to foulbrood.

Plant breeders also are developing plants with more sugar in the nectar, and with flowers having shorter stems, so bees with short tongues can reach the sweet food.

More attention is being given to thc use of bees as pollinizing agents, Prof. Price said. It has been shown that the yield of red clover seed can be increased from a bushel to the acre, which it about the average yield without bees, to 12 bushels an acre with bees and 100 per cent pollinization.

The new sudlfa drug treatment, coupled with the breeding of disease-resistant bees, will eventually wipe out foul brood, which has long been a menace to beekeeping, Professor Price said.

Old Age Pension Is Great Need For Baptist Veterans

Many Leaders Favor Idea Which May Reach Fruition at 68th Annual Convention

If some leaders of the National Baptist Convention of America can gain sufficient support in putting over their ideas, the Constitution of the Convention may be amended to provide a Board to handle funds for disabled ministers, in some form. There are two schools of thought on this matter; some want it to be a pension outright for those pastors who are physically unable to carry on their work and cannot look after the affairs of the particular church or churches that they have served; then there is another group who feel that it should be in the form of a pension to be given and paid by the convention after a minister has reached a certain age. It is thought however, that these two schools of thought would come together, discuss the matter, formulate plans and arrange for the raising of the funds either by direct taxation or volunteer contribution, so much per capita from each church member, each Association, District or General Association or Organized Groups registering with the Convention from year to year.

One Baptist leader voiced the opinion that if one dollar could be raised from each Baptist, according to their statistician's report, it would total two million, six hundred fifty thousand dollars in cash for one year, and that if this could be raised over a period of ten years it would reach the staggering sum of twenty million, six hundred fifty thousand dollars; and, said he, if this was invested in U. S. Bonds over a forty or fifty year period at a rate of two and a half percent, it would bring into the Convention or into this Department of the Convention in interest, something like five hundred sixteen thousand, two hundred and fifty dollars, a year, roughly speaking, and this of itself, would be a sufficient amount to pay these heralds of the eross who have worn themselves out or become disabled in the ministry of Baptist churches, a salary of around one hundred dollars per month, to be raised from the interest paid on this investment. He said it might ly worked out, and should be done.

Many letters have come to the National Baptist Union-Review urging that such a plan be considered. In order therefore, to test the matter out, the secretary of the National Baptist Publishing Board sent out this month more than one hundred telegrams to the leaders throughout the nation in a kind of a straw vote, so that when they reach the convention he would have some kind of an expression as a guide for the convention to go by.

However, it was learned here that no matter of this kind has ever been presented in a tangible way to the executive board, even at its last meeting during the session of the Sunday School Congress held in Kansas City; but it was discussed in Kansas City, and it was discussed at the first session of the board held in 1948 down in New Orleans, La., but because of a crowded agenda and a heavy program the matter was not brought up, because the time for discussion would have been too limited.

Dust Bean, Potato Plants to Destroy Insects Now

By Dr. Floyd BRALLIAR
Garden Editor
The Nashville Tennessean

The little shot-beetles that eat holes in the leaves of beans and made them look as if someone might have shot them with a shotgun have been unusually abundant ths year but as they do very little permanent damage, we have said very little about dusting or spraying in order to get rid of them.

But the Mexican bean beetle may be expected to put in another appearance at any time now. And we can not afford to allow them to live and thrive on our plants. They are the most serious pest bean growers have to contend with. The pest, is just before they arrive, so best time to fight bean beetles or we advise all gardeners who have had trouble in past years with Mexican bean beetle or with Colorado potato beetle to get busy at once.

Cryolite Excellent

Possibly the one best dust to use for the control of either of these pests is eryolite. Cryolite is practically non-poisonous to man and is poisonous to these insects. It is cheap, so we advise that all potato vines be thoroughly dusted with cryolite at once

If a good job of dusting s done, so that the dust gets on the underside of the leaves, it will kill all the Colorado potato beetles as fast as they arrive. They will not even get a chance to lay eggs

If we dust the second time in 10 days we can be sure that your potatoes will not be injured this year. Cryolite will also kill all other insects that may attempt to attack potatoes.

Dust Beans Also

If your beans have already bloomed and set pods, dust them also at this time even though you may find no indications of the effect of the bean beetle Because none of us like to have green beans covered with dust of any kind, we do not recommend dusting them after the pods begin to set, unless the Mexican bean beetle has already appeared. If they have put in their appearance dust at once and wash pods thoroughly when you pick them This beetle increses so rapidly that it may take no more than a week or ten days for it to kill your plants after the first ones arrive

Daybreak

Dee Wood

It's such a lovely morning, Lord,
I'd like to say a prayer,
Or sing a song about the sunlight
Sparkling everywhere,
It paints the gatepost orange
And the path all golden bright,
While the mirror's edge makes rainbows
Dancing in the light.

I'd like to thank you, Lord, for this
Day I've watched dawn with you!

Dr. W. O. Harper's Library

Former Ohio Pastor Left Over 650 Volumes Of Valuable Books

Deceased's Daughter Feels That Some Baptist College Or Library Should Have Collection

When the Rev. W. O. Harper, D. D. passed away this year and was buried in Ohio his entire library, which was supposed to be one of the most extensive of any Baptist minister of either Convention, according to information coming from his daughter, Mrs. Ethel Gray, who resides in the nation's capital, and who says she is anxious to dispose of it, consists of nearly 700 volumes of books. Mrs. Gray has requested the National Baptist Union-Review and Secretary Boyd to contact Baptist leaders and allow them to make an offer for the entire list of publications. They appeared in a recent issue of the National Baptist Union-Review alphabetically arranged.

Mrs. Gray says she recognizes the fact that some of the books may be slightly worn, but all of them contain full contents as they were first published. Many of the publications are rare, because some of them are out of print and could only be found at some second-hand store. Secretary Boyd has consulted a number of highly-educated ministers who have completed their college work, their university work and their theological course. Each of them has written to the effect that the entire lot would be quite an advantage to any library of any educational institution, or they would enhance the size and value of a minister's library, provided of course, that he has discriminating taste in wanting such a list of Reference Books, Theological Studies, Books on the Bible, Encyclopedia, etc.

The late Dr. Harper was a personal friend of the late Rev. Ernest Hall, D. D., who, at the time of his death is said to have had the only library and collection of books superior to that of Harper; but Dr. Hall's library has already been disposed of.

Mrs. Gray says it was her father's desire, and one of his great ambitions before he died, that this collection of books should be so placed that they could continue to be used by religious leaders; so the Rev. Mr. Boyd in his announcement in the Union-Review, is asking for offers for the entire set which will be sold for cash and the proceeds turned over to Mrs. Ethel Gray, the daughter of Dr. Harper, to add to whatever is to be realized in cash from his estate.

Unopened Eyes

Sadhu Sundar Singh told of a bird's nest in the Himalayas, which he had taken time to observe while passing on a journey. The young birds with yet unopened eyes, when ever the rustling of their mother's wings was heard opened their mouths and received what she brought. They could not see her, but they accepted the fact of her love, and took by faith what came to them through her ministry. From this he drew the spiritual application that men, though higher in the social and intellectual scale, are yet inferior to te nestlings. For men, because they cannot see God doubt His existence, even though they are constantly receiving from His benevolent care all things of which they have need.

The sadhu's application suggests that men disbelieves because of his immaturity. But there is a deeper reason. Paul points it out (2 Cor. 4:4, R. V. marg.): "In whom the god of this age hath blinded the minds of the unbelieving, that the light of the gospel of the glory of Christ, who is the image of God. should not dawn upon them." It is not immaturity that shuts out the knowledge of God from the race. Mankind is not slowly but steadily evolving through education and moral perfecting to a clear vision of eternal things, as many are urging. Like birds he is born blind, but sight can come only through supernatural enlightenment. To see God requires a new and a spiritual birth. To attain to the likeness of the Son of God new nature is needed.

It is a humiliating thing, but a truth of Scripture, that the wise of this world have not the capacity through their wisdom to see or to know God. The All-wise and the All-holy reveals Himself to the childlike. And as in nature, so in grace, childlikeness comes through birth.

Denominational Executives To Meet in New York

November 22nd To 23rd Are The Dates Announced By Dr. Gerald Knoff

Session To Be Held In Hotel New Yorker, According To Statements And Letters Mailed By Miss Susie Mae Agee Of The International Council

New York, N. Y.— (Spl.) —Denominational executives who make up the International Council of Religious Education will hold a meeting in this city on November 22 and 23 in Hotel New Yorker. An official notice of this has been sent out from Dr. Gerald Knoff's office by Miss Susie Mae Agee, who is acting for the Doctor.

This meeting will bring to the nation's metropolis the executives of forty-two denominations. During their stay they are to delve into those problems of administrative, executive and managerial affairs of these religious groups. It was not known until the middle of July that these dates were permanent, as a poll had been sent out to all of these leaders asking them to decide upon the most convenient date. The result was that November 22 and 23 was the most convenient to a majority of them.

The secretary of the International Council, Dr. Roy G. Ross, and the two associate secretaries, Drs. Knoff and Landis, with other staff members from Chicago's headquarters, are expected to be in attendance for this special meeting.

Birds Like Play Time

Just as human beings build homes in the country or cottages at the mountains or the beaches, so the bowerbird of Australia builds a country home. Deep in the forest, under the overhanging branches of a tree, so well hidden that only careful search reveals it, a cozy little bower is built.

These ingenious homes are decorated with shells, pebbles, or bones, and have entrances at each end. When the bower-bird wants a change from the strenuous duties of home, he flies to the little bower in the mountains and here remains for certain periods of the year for rest and recreation. The bowers are used by the bird solely for amusement and relaxation and not as regular nests.

Birds build apartment houses, too. The weaver-bird is the builder of the most wonderful nests in the world. Travelers in Africa have brought back remarkable tales of the apartment houses which the bird makes. The nests are made of grass and joined together. Sometimes as many as 320 of them have been found thus united.

They look a little like mushrooms and are so large that at a distance they have been mistaken for native huts.

Oh, the endless variety in God's creative acts. — HIGH-SCHOOL CHRISTIAN.

Now Bring on the Steak

If and when you sink your teeth into sirloin steak again, you may be interested in knowing that the word has an usual history. It seems that King James I of England became very enthusiastic when a particularly fine loin of beef was placed before him one day when he had worked up an appetite by hunting. He drew his sword and knighted the meat, calling it "Sir Loin." It has been sirloin ever since!—Religious Telescope.

Definitions Not Found in Webster's Dictionary

A statistician: A man who draws a mathematically precise line from an unwarranted assumption to a forgone conclusion.

Tact: The unsaid part of what you think.

Poise: The art of raising the eyebrows instead of the roof.

Rich man:: One who is not afraid to ask the clerk to show him something cheaper. ,

Winter: The season when we try to keep the house as hot as it was in the summer, when we complained about the heat.

Conscience: The still small voice that makes you feel smalled voice

.. Christian Observer

Bureaucracy

Latest bureaucrat story making the rounds in Washington concerns an efficiency expert who stalked into the office of Petroleum and Oil-Shale Reserves, and walked up to two clerks. He asked the first clerk, "What do you do here?"

The clerk, fed up with red tape, buck-passing, forms, office politics, and above all efficiency experts, answered: "I don't do a thing!"

The efficiency expert nodded, made a note, then asked the second clerk, "And you, what's your job here?"

The second clerk, a fellow sufferer, said, "I don't do a thing either."

The efficiency expert's ears perked up. "Hmmm," he said, "duplication-"—Pathfinder

College President Says Teach Youth To Fight Bigotry

Tuskegee Institute, Ala., Aug. 18, 1948—"Our colleges and our secondary schools have before them a much bigger task than the mere teaching of science, mathematics or the language arts," said Pres. C. V. Troup of Fort Valley State College in delivering the commencement address to the Tuskegee Summer School graduates at exercises held in the Institute Chapel Friday night.

"Negro youth in America," continued the Georgia educator, "must be taught those techniques for survival which will enable them, in spite of handicaps, to find the fullest possible expression for their God-given talents." Four survival techniques were listed by the speaker: "Young people must be taught to be dissatisfied with second class citizenship and the indignities which charaeterize it. Aggressiveness in terms of "a willingness to take a determined stand for that which one regards as right" was advanced as a second technique.

Sumner County Has Most Dairy Farmers Cooperating with 170 Striving to Rid Herds of Dreaded Disease

Mastitis, one of the most destructive diseases among dairy herds, is slowly but surely being brought under control in Tennessee, according to Dr. A. A. McMurray, director of the mastitis control program for the State Department of Agriculture.

The program which is being conducted on a strictly cooperative basis between the dairyman and the state department, has been put into effect in almost every dairy county in Tennessee, Dr. McMurray said.

Dr. McMurray, who is being assisted in the work by seven technicians, explained that the state makes all the necessary checks to determine the extent and cause of the disease without cost to the farmer and the farmer in turn agrees to follow the advice of the specialist assigned to his herd.

Middle Tennessee has been taking a lead in the program. Robert A Boudreau is the technician in charge of the work in this area and he is now cooperating with dairy farmers in a dozen counties.

Sumner County has the most farmers cooperating with 170 striving to rid their herds of the dreaded disease, which reduced production and quality of milk and often renderes the animal worthless.

Typical of those farmers is Joe Johnson of Hendersonville. Johnson is milking a grade herd of 33 cows in partnership with Miss Sarah Berry, one of the most progressive farm operators in Sumner County.

"I had thought that if there was one thing I knew how to do it was how to milk a cow," Johnson said. "I have since learned that most everything I did was contrary to the rules for profitable milk production."

My first impression when I heard of the program was that no man would have time to do all the things necessary to prevent mastitis losses," Johnson said. "However, I have found that I spend only one hour and 18 minutes milking under the new method as compared to one hour and 30 minutes under the old."

"No dairyman can afford to operate his dairy in the old haphazzard method. I am on this program and I intend to continue to operate in this manner until I have eliminated all mastitis in this herd."

Boudreau assisted Johnson in checking his herd for mastitis and also had laboratory tests made on each animal in the herd. It was found that a large per cent of the animals had from a minor to a major case of mstitis.

Johnson was quick to adopt the recommended sanitation and management program. This included washing each cow's udder with an individual cloth from a bucket of warm chlorene water from one to two minutes before the milking units was attached, rinsing of the milk unit teat cups in cold water and warm chlorene water before attaching it to the udders and the removal of the unit as soon as the milking process is completed.

"I have learned that I can't operate two units and remove them from one animal to another in the correct manner without leaving them attached to the udder too long," Johnson said. He now uses only one unit at a time and has found that he saves time and has also increased production.

Production increases because the animal is prepared for milking in the correct manner, Boudreau explained. By having the animal ready for milking and removing the unit as soon as the last milk is drawn, there is less chance for injury, the starting point of all mastitis infection, the technician explained.

"No milkman can successfully operate two units at the same time and if you are to use the second unit then you should by all means use the second milkman," Boudreau said.

The program has been in operation in Tennessee on a small scale for three years. It was only initiated on a state-wide basis a year ago, but it has gained the favor of farmers so rapidly that calls continue to flood the director's office.

"Tennessee has pioneered the control and prevention of mastitis for the rest of the nation, Commissioner of Agriculture O. E. Van Cleave said. "We know now that the disease can be prevented and it can be controlled and the services of the department are available to any and every farmer in the state."

Harvested Worms Take Joy Out of Line-Wetting

By Arthur Edson

Washington— (AP) —Your government yesterday dealt a cruel blow to all ex-boys who also are ex-earthworm hunters.

It came out with a booklet telling how to grow your own worms.

Remember the classic picture? Barefoot boy_ _ battered straw hat _____fishing pole_____ digging for worms.

Why, it was half the fun of fishing.

There was the dark spot down by grandpa's barn. Nearly every spade full contained at least one fat earthworm which later would be spit upon, for luck, before being dunked into the nearest pond or creek.

Well there's no halting progress.

Your government points out that fishermen long have been so lazy they have gone to dealers for their worms. So it's time we all understand the best way to grow our own.

The way people in the fish and wildfire service put it, in their "propagation of minnows and other bait species." the kid who dug for earthworms seems rather silly, hunting worms for his tin can.

"A tub two feet in diameter and 10 inches deep." they say. "should produce several thousand worms a year."

Easy does it, too.

Get yourself some good loam, well moistened. Get yourself some mama and papa worms. Each day feed them chicken mash or a mixture of coffee grounds, dried cracked wheat and bread crumbs.

The ultra-lazy can mix one pound of lard with two pounds of corn meal, and have enough worm groceries to last a month.

Within three months, a worm is bait-sized. Within six months, he's worm-sized.

Things have come to such a pass that we no longer dig worms. Says that booklet.

"The worms can be harvested by emptying the box and sorting out those of suitable size."

All right, all right. Let progress come. Let the automobile crank, the hand churn and the mustache cup go—and good riddance.

But for my money a fish so dumb he would nibble on a harvested worm isn't worth catching.

Harvested, indeed!

Britain Trims Meat Ration to Dime's Worth

LONDON—(AP)—The food ministry said last night each Britain will have to get along on six pence (10 cents) worth of fresh meat again next week because of the recent dock strike.

The other half of the one shilling (20 cents) meat ration will be for the second straight week, canned corn beef. When meat supplies return to normal, Britons will be required to take only two pence worth of corn beef.

The ministry, however, gave housewives some good news along with the bad.

They will be allowed an extra pound of sugar for jam making during the four-week period beginning July 18. Tomato supplies are expected to be so heavy that price control will be lifted around mid-August.

Dry Weather, Neglect Harm Evergreens and Boxwoods

By Dr. Floyd Bralliar
Garden Editor
The Nashville Tennessean

Hundreds of evergreens and boxwoods, especially those that were set out late last fall or early this spring, are suffering greatly because of the prolonged dry weather and the failure of the owners to know how to care for them.

We recently saw one rather expensive planting where every tree had already died. Though undoubtedly they might have been saved had they been given the proper care. In the first place evergreens should be kept thoroughly well watered all summer long. This is especially important for those plants that have not been set out more than a year.

Should Be Soaked

Evergreens cannot be dug and moved economically without cutting off a large proportion of their feeding roots, and yet many people never think it is necessary to reduce the leaf surface of the tree, nor deos it ever occur to them that the roots that are left on the plant must absorb as much water at one time as the entire root system was absorbing before the plants were dug.

If the trees are planted where the drainage is reasonably good, the ground around the tree should be thoroughly soaked twice a week, during dry weather, and even though drainage is not good it should be soaked once a week.

Mulch with Peat

Evergreens and especially boxwoods will thrive much better if the soil under and around them is mulched two or three inches deep with granulated peat, cottonseed hulls, or lawn clippings. Boxwoods come from rather cool but never extremely cold climates, where the soil is slightly sour and uniformly moist. This mulch goes far toward furnishing this condition for the roots of the trees.

Red spider, that demon that is almost microscopic in size, and multiplies with great rapidity kills hundreds of junipers and retinispora, every year but it seems more destructive to boxwood. To present this at least once a week turn the hose on these plants, giving the water plenty of pressure. It is best to hold the nozzle of the hose under and near the middle of the trees and spray outward so that the water strikes the under side of the leaves where these spiders work.

Will Destroy Spiders

If this is done faithfully and accurately, it will keep down the red spider pest, but as a special precaution, it is also wise to spray boxwood with a good insecticide, especially recommended for boxwood. Your dealer from whom you purchase your insecticide should be able to tell you what you should buy. We personally insist on a material that contains both pyrethrum and rotenone.

Apply any insecticde from the inside of the plant outward, so as to get it on some of the leaves. Red Spiders are already beginning to appear in abundance.

Pay Up Mortgages, Other Debts Before Buying, Babson Advises

By Roger W. Babson

Babson Park, Mass., June 3—The Agricultural department in Washington is putting out warnings as to the high prices of farm land. Their agents are advising against the purchase of more property at present prices. Readers are also disturbed by the chart which appeared on page 79 of Time Magazine May 3.

The facts are that these big increases in land values are not the same in different sections of the country. Probably the farm values fairly near large cities are abnormally high. They are selling not on their value as producing farms, but rather on their speculative value for sub-divisions, etc. This also applies to pasture land near small cities. There seems to be an abnormal demand for "bottom land" which in many cases is selling far above a sensible price.

The special concern of the Agriculture department, however is in connection with land being bought on mortgage. They are very much opposed, at the present time, for farmers to buy land for which they cannot pay cash, believing that sooner or later a crash is coming, due to an inevitable decline in farm prices, of course, the ultimate value of a farm is whether or not it can raise crops which will pay a fair rate of interest on the land after all expenses, and this of ceived, as well as the wages and course depends upon the price re- other expenses which must be paid.

City and Town Property

The Federal Reserve Bank in Washington is especially disturbed at the continuous climb in mortgage loans on city and town property. This is probably due in part to the activity of the Federal Loan and Savings Banks in soliciting mortgages. Certainly this should be curbed at the present time. It is wrong for mortgage loans on real estate to be climbing during a period in which business loans are dropping off steadily and are being reduced.

These Federal Loan and Savings Banks must be careful not to be part of a vicious circle whereby someday the property, upon which they are now loaning and which loans are in part guaranteed by the Government, will come back into the Government's hands. If the Government then adopts a policy of selling these houses at auction, the houses for which the veteran now pays $10,000 will be selling the open market for $5,000 or even less. It s entirely possible that what happened to city and small town real estate in the 30's, could easily repeat in the 50's.

Reasons For Being Cautious

There are four definite reasons which people should carefully consider before further bidding up prices for any kind of real estate. These reasons are as follows:

(1) The upward trend in mortgage indebtedness, which in some localitics is reaching a dangerous point.

(2) Threats of surplus farm products and even certain manufactured of producton.

(3) The recent downward trend in the buying power both of farmers due to lower prices of farm products and of the industrial population due to the increased cost of living.

(4) The fact that a large proportion of the money now being sent to Europe will be used to aid Europe to produce more farm products and manufactured goods in order to be independent of us.

How to Invest

Use your earnings first to pay up your mortgages and other debts. Then put your buildings and machinery into good shape so you can go through the next depression without any maintenance costs. After this, give your wife a break by buying her a modern kitchen and bathroom.

She was patient and thrifty for you during the hard times: she now is getting older and cannot do so much. Be liberal with your church and give your children a useful education in agriculture, mechanics or business. Above all, have a good savings bank account or a safe deposit box of U. S. Government "E" bonds. DON'T KEEP THESE IN YOUR HOUSE.

Soil Analysis Pays off Eaglesville Farmer

A 25-cent investment saved J. R. Turner of Eaglesville, more than $50 last fall when he was making plans to seed his 12-acre field to rye and pasture grasses. Although he had already bought some 3,000 pounds of fertilizer, he followed the advice of a neighbor and had an analysis made of the soil. The result was that no additional fertilizer was needed. It was used on other crops. Turner is convinced that soil analysis is dependable. The 12-acre field was seeded with one bushel of rye. two pounds of Ladino Clover, 10 pounds of orchard grass and one pound of white clover per acre. It has provided excellent grazing all fall and winter. Recently the field carried 29 head of beef and dairy cows, more than 60 sheep and nine hogs for four weeks. Turner will clip the field to give the other grass es a chance. The rye clippings will be saved for hay.

U. S. Will Offer to Subsidize '46 Tobacco Exports

Washington, May 31—(AP)—The Agriculture Department said today it will offer to subsidize export of between 30,000,000 and 40,000,000 pounds of surplus 1946-crop fire-cured and dark air-cured tobacco.

It will make subsidy payments to exporters equal to one-third of the sales price of such tobacco. The tobacco is now held largely by grower associations and the department under the prices supporting loan program.

Foreign buyers would get the tobacco for two-thirds of a price to be determined by the department to be "fair and reasonable." Officials said prices would range between 30 and 40 cents a pound, at shipboard, depending on grades and qualities.

Stocks held by dealers would be eligible for the subsidy program.

The subsidy would be paid on sales or contracts to sell filed with the department prior to June 24. The tobacco must be exported no later than December 31.

Subsidies will be paid out of a share of customs receipts which regularly are turned over to the department for disposal of farm surpluses.

The types of tobacco eligible for the subsidy program are Virginia fire-cured type 21: Kentucky and Tennessee fire-cured types 22, 23 and 24; one-sucker type 35, and Green River type 36.

Throwing wire, pieces of lumber, with nails in them and other metal with sharp edges into the corner of the horse lot is a common yet dangerous practice.

Renovate Strawberries Now for More Profitable Crop, Horticulturist Says

Renovate and fertilize strawberries now for a profitable crop next year, J. J. Bird, associate horticulturist of the University of Tennessee said today.

"There are entirely too many 50 to 75-crate per acre crops produced in Tennessee," he said.

Bird blamed the low and unprofitable yields on the failure of producers to properly manage the plant field following harvest.

Renovating—removing weeds and excess plants should be completed in time to allow fruit bud formation by September.

A number of methods are commonly used and they are all desirable if carried out properly, Bird said.

Some strawberry growers run a bull tongue plow down the middle of the bed of plants, others baroff on either side of the bed leaving an eight to 10-inch strip.

These methods followed by a cross harrowing to remove weak and excess plants proved satisfactory during the past season, Bird said.

The horticulturist cautioned farmers to use an adequate amount of commercial fertilizers following the renovation. He recommended a minimum of 500 pounds of 4-8-8 or a fertilizer as near that analysis as possible per acre.

Whether you produce berries for home or commercial uses, it is always profitable to give the plants attention at the right time, Bird declared.

A pink elephant, a green rat, and a yellow snake walked into a bar. "You're a little early, boys," said the bartender. "He ain't here yet."

WOMAN'S PAGE

A Few Hot Weather Suggestions

Turn to crisp, colorful salads and sliced cold meats for summertime suppers. Roasts or meat loaf, prepared in the cool of the morning, will do double duty. served both hot and cold, and you'll find the same trick handy for some vegetables—potatoes, for example. Bake potatoes in the oven when you are cooking the meat; they'll be ideal creamed with a quickly prepared sauce at dinner time. Toss a salad, serve fresh fruit for desert and your meal will be complete. and easy!

Garden Meat Loaf

1 lb. ground beef
1-2 lb. ground pork
1-2 lb. ground veal
2 tsp. salt
1-2 tsp. pepper
1 cup bread crumbs
1-4 cup butter
1-2 cup minced onion
1-2 cup minced celery
1-2 cup milk
1 egg, beaten
3 tomatoes (cut in flowers)

Mix beef, pork, veal, salt and pepper. Add bread crumbs. Brown onion and celery in butter. Add to meat mixture. Add milk, egg and mix. Pack in greased pan or form into loaf. Arrange tomatoes over loaf last half hour of baking time. Bake in 375-degree oven 1 1-4 hours. Serves six.

Beef And Liver Loaf

1 lb. sliced liver
Salt and pepper
1 small onion
1 lb. ground beef
1 egg
1 cup soft bread crumbs
3 tbsps. butter or margarine
3-4 cup thick sour cream
1 pimiento
1 cup cooked rice
3 tbsps. thick sour cream

Sprinkle the liver with salt and pepper, broil on both sides and remove tough pieces of vein and skin. Put onion and liver through food chopper. Add beef, slightly beaten egg, two teaspoons salt (above), 1-8 teasuoon pepper, bread crumbs (fried in butter) and the 3-4 cup sour cream. Mix well and pack about third of this mixture in greased loaf pan. Chop pimiento, mix with rice and small amount of sour cream, cover layer of meat with rice, then add rest of meat, pack down and bake in 350-degree oven for about one hour. Serve hot or cold. Serves 6-8.

A perfect accompaniment to a cold meat and salad platter would be slices of French bread or finger rolls, spread with garlic butter and toasted.

Cold Meat Salad Platter

Salad

2 cups cooked diced carrots
2 cups cooked diced potatoes
1 1-2 cups cooker diced beets
1 1-2 cups cooked green peas
3 hard-cooked eggs, chopped
Assorted cold cuts
Lettuce cups

Dressing

1-4 cup salad oil
2-3 cup vinegar
1-8 tsp. black pepper
3-4 tsp. salt.
1 tsp. prepared mustard
2 tbsp. cold bouillon
1 tbsp. chopped parsley

Mix oil, vinegar, pepper, salt, mustard, bouillon and parsley. Let stand 30 minutes. Combine diced vegetables and eggs. Add dressing and toss lightly. Fill lettuce cups with salad mixture, surround cups on platter with cold cuts. Serves 12.

Stuffed Tomato Salad

6 medium-sized tomatoes
3-4 lb. cottage cheese
4 tbsps. mayonnaise
3-8 tsp. grated onion
1-8 tsp. salt
1-8 tsp. pepper
1-2 Spanish onion, sliced into rings
1 large green pepper, sliced
1 sweet red pepper, sliced
Endive or letuce

Slice off stem of tomatoes, remove seeds and invert to drain. Mix cottage cheese with mayonnaise, grated onion and seasonings. Fill tomatoes with mixture. Replace tops on tomatoes. Arrange stuffed tomatoes, with onion and pepper rings, on endive or lettuce leaves. Serve with nut mayonnaise.

Nut Mayonnaise

Add four tablespoons pistachio or other nut meats, slivered, to one and one-half cup mayonnaise. This dressed up mayonnaise lends a rich flavor to simple salads. Serves 8.

Contrast the crusty bread or hard rolls which are ideal with meals of this sort with a fruit bread.

Raisin Bread

1-2 cup sugar
1-2 cup molasses
1 tsp. salt
3 cups whole wheat flour
1 cup white flour
2 cups sour milk or buttermilk
1 tsp. baking soda
1 cup raisins

Mix ingredients, pour into three No. 2 round tin cans that have been well greased. Bake in 350-degree oven 50-60 minutes.

Barbecue-Hash

3 cups diced cooked meat
1-4 cup grated onion
2 tablespoons lard or drippings
2 teaspoons salt
1 1-2 cups vinegar
1-2 cup water
1-4 cup prepared mustard
3-4 cup chili sauce
1 tablespoon brown suger
1 1-2 cups diced cooked potatoes

Brown onion in melted lard or dripping. Add meat and brown lightly. Season. Make barbecue sauce by combining vinegar, water, prepared mustard, chili sauce and brown suger; shake well Add barbecue sauce to meat and onion mixture and allow to simmer for 15 minutts.

Add diced cooked potatoes and heat long enough for flavor to blend, about 10 minutes. 6 servings.

RHUBARB PATSY

3 to 4 cups diced fresh rhubarb
1 cup sugar
1 tespoon butter
1-2 cup ready-to-eat bran
1-2 cup milk
1 egg
1 1-2 cups sifted flour
3 tespoons baking powder
1-2 cup sugar
1-2 tespoon salt
1-3 cup shortening

Arrange rhubarb in baking pan; sprinkle with 1 cup sugar and dot with butter.

Soak bran in well-beaten egg

COOKIE-MAKING TIP

When seedless raisins are to be used in cookies, soak them for a few minutes in hot water, then drain and add them to the cooky dough. The baked cookies will seem more moist and fruity.

MUSHROOM RABBIT

2 tablespoons butter or margarine
2 tablespoons flour
1-3 teaspoon salt
Dash cayenne pepper
1-4 teaspoon dry mustard
1-2 teaspoon Worcestershire sauce
1 cup milk
1 1-2 cups grated American cheese
1 (4 oz.) can sliced or button mushrooms
6 slices toast

Melt 1 1-2 tablespoons butter in top of a double boiler. Blend in flour, salt, pepper, mustard and Worchestershire sauce. Add milk and cook until thick, stirring constantly. Add cheese and stir until cheese melts. Melt remaining 1 1-2 tablespoons butter in a skillet. Add mushrooms and sauce for 5 minutes. Add saulted mushrooms to cheese sauce. Serves to 6 on toast.

Waldorf salad —apple mixed with celery, walnuts and mayonnaise—is particularly delicious when served on salad green accompanied by a small ball or scoop of cottage cheese

STRAWBERRY AND ORANGE JAM

3 cups prepared fruit
4 cup sugar
1 box powdered fruit pectin

Peel 1 large orange and 1 large lemon. Remove sections of pulp, free from membrane, and dice Crush thoroughly 1 quart fully ripe strawberries. Combine fruits and measure 3 cups into a large saucepan.

Measure sugar and set aside. Place saucepan holding fruit over high heat. Add powdered fruit pectan and stir until mixture comes to a hard boil. At once stir in sugar. Bring to a full rolling boil and boil hard 1 minute, stirring constantly. Remove from heat, skim, ladle quickly into glasses. Paraffin at once. Makes about 7 six-ounce glasses

A jar of cocoa or chocolate syrup kept ready in the rerigerator may be used in cold drinks, over simple cakes or ice cream. A drop or two of peppermint extract may be added to the syrup on occasion for a taste-change.

STUFFED EGGS EN CASSEROLE

8 eggs—
1-3 cup grated cheese
1 tablespoon lemon juice
1-2 teaspoon dry mustard
1-2 teaspoon salt
1-3 cup melted butter or margarine
3 cups white sauce
1-2 cup blanched almonds

Cook eggs in boiling water for 20 minutes. Plunge into cold water to cool. Remove shells and cut eggs crosswise. Remove yolks and mash. Add cheese, lemon juice, seasonings and butter or margarine. Refill the whites. Arrange in a casserole. Pour white sauce over all. Sprinkle with shredded almonds. Place in a 350-degree oven and bake for 20 minutes.

SUPPER DISH

A tasty corned beef hash mold, filled with creamd onion is a good choice for an informal family supper. To prepare, combine 1 cup milk with 2 well-beaten eggs. Mix 2 cans corned beef hash with milk-egg mixture. Pack in a well-greased nine-inch floured ring mold and bake in a moderate oven(350 degrees) for 30 minutes. Turn onto hot platter and fill center with tiny whole creamed onions.

Spinach is best cooked when you use just a little water. The water that clings to the leaves after washing the spinach is all you need.

Canned luncheon meat takes on new glamour when topped with pineapple perserves or crabapple jelly and baked until heated thoroughly.

PICNICKERS' CHOICE

Egg and ripe olive sandwiches are the pick of picnickers for good-tasting lunch box fare. Slice olives from pits and combine with coarsely chopped hard-cooked eggs. Season with prepared mustard, salt and pepper, and a bit of celery for variety. Blend together with mayonnaise. Spread between slices of Russian rye bread

LUNCHEON ENTREE

Make the most of all the fresh green asparagus that is in the markets. Instead of serving it for a vegetable, lay the cooked spears on a slice of toast and top with creamed hard-cooked eggs with a bit of chopped chive on top. It makes a good-looking supper or luncheon entree.

Stuff wet shoes with soft paper or absorbent cloth to take up moisture.

DESSERT SUGGESTION

You can prepare your dessert right at the table when you serve chocolate waffles shortcake fashion. Arrange drained sliced canned peaches between waffle quarters, then top with more peaches and whipped cream This dessert is perfect for summertime when the cook likes to stay out of the kitchen as much as possible.

YAM AND PINEAPPLE CASSEROLE

3 cups cooked, mashed sweet potatoes
1-4 cup butter
1-4 cup firmly packed brown sugar
1 1-2 teaspoon salt
1-8 teaspoon cloves
3-4 cup drained crushed pineapple
2 egg whites stiffly beaten

Combine sweet potatoes, butter, brown sugar, salt, cloves and pineapple, and mix well. Fold in egg whites. Turn into a buttered 1 1-2 quart casserole. Bake in a moderate oven (350 degrees) about 45 minutes, or until potatoes are puffy and browned. Six servings.

HOUSEHOLD HINT

The finger of an old cotton canvas glove placed over the end of a curtain rod will enable one to slip the curtain onto the rod with no danger of catching or tearing the material on the metal rod.

CLEANIING HINT

Don't neglect the rug and carpet cushions you use to prolong the life of your floor-coverinps. They gather dust if neglected, just as your rugs and carpets do. Vaccuum clean the pads at intervals and you will have cleaner floors, rugs and carpets.

STITCH IN TIME

If pockets on Junior's trousers or Dad's work clothes tear at the top corners, stitch them with a diagonal stitch when they are new. Start from the top corner tand proceed southeast or westward as the case may be for 1-4 to 1-2 inch and then straight down until it meets the first cross row of stitching.

SUBSTITUTE COCOA

Cocoa may be substituted for chocolate in cake baking when the latter is not in the house. Use 3 tablespoons of cocoa plus one-half tablespoon shortening for each square of chocolate called for in the recipe and sift the cocoa with the dry ingredients.

Plants frequently fail because they are drowned with too much water or allowed to dry out in a warm dry atmosphere indoors.

Be sure that your kitchen equipment includes a fat salvage can.

Of the herbs which have survived in cooking, parsley is the most popular. Dill is next. Tarragon, which is the favorite flavoring for vinegar, is a tender perennial, but there is an annual form which gives much the same flavoring.

Extend Redemption Period for '47 Naval Stores Loans

Farmers who secured Government loans on their naval stores last year instead of selling them outright have until June 1 of this year to redeem their products, the U. S. Department of Agriculture has announced.

Department officials says that this two-month extension from April 1 will enable producers to benefit from any advance in the market prices which may result from the early spring demand for turpentine for painting.

African Population to Benefit by Increased Colonial Food Output

Important by-products of European expansion of food production in Africa and other colonial areas will be improved living conditions, better diets, and increased health and educational facilities for the native populations, says the March issue of Foreign Agriculture, a U. S. Department of Agriculture publication.

The British, Belgians, French, and the Netherlanders are planning increased agricultural production in their colonial territories, according to the publication. Commodities to be emphasized will be vegetable oils, rice and cocoa. However, in some areas fruits, vegetables, dairy and other livestock products will be included in the program.

Expansion of agricultural production will require the clearance and drainage of millions of acres. From the point of view of the native population, this will mean the removal of the breeding places and natural habitats of many disease-carrying insects and other pests, including the tsetse fly which is a carrier of sleeping sickness.

In addition to creating more healthful surroundings, increased agricultural production will bring with it an improved domestic water supply, irrigation, electric power, transportation and processing facilities. These will serve to increase the income of both workers and producers, it is pointed out.

The British agricultural program calls for a larger production of cocoa, wheat, rice, soybeans, and peanuts, says the USDA publication. In East and Central Africa, Great Britain plans to plant 1,605,000 acres of peanuts by 1952. The plan envisions the establishment of 107 mechanized peanut farms of 30,000 acres each. The peanuts are to be used as an additional source of fats and oils.

One British area of Africa has inaugurated a long-range rehabilitation project for redistribution of the population and the livestock from soil-depleted disticts to newly irrigated areas. In addition to providing ample water supplies, the government hopes to introduce improved methods of husbandry, soil conservation, and agricultural mechanization on a communal basis for about one-fifth of the native opulation in the section. The British also have plans for promoting increased agricultural production in Jamaica and Malaya.

The Department publication says that the Belgians plan to increase the production of vegetable oils from palm kernels and cotton seed in the Belgian Congo, while the Netherlanders are attempting to restore their production of copra and palm oils in the East Indies to prewar levels.

The French are working out a program which proposes to mechanize the cultivation of peanuts for oil on a million acres in their African colonies. Also, they plan to develop cooperatives for semi-mechanized peanut production by native African growers.

Home Demonstration Week Observed May 2-8

National Home Demonstration was observed throughout rural America during May 2-8, says Extension Service Director M. L. Wilson of the U. S. Department of Agriculture.

More than 3,500,000 white and colored farm women, who are taking part in home demonstration work, participated in the observance. The theme of the week was "Today's Home in Tomorrow's World."

Use cottage cheese often for a low-cost protein food.

THE MODERN FARMER

VOL. XXI. NASHVILLE, TENNESSEE, AUGUST 15, 1948 No. 7

Congressman Praises Sharecropper Veteran Who Wins Top Honors

Overlending Can Injure Farmers Says Com. C. R. Arnold

Washington, D. C.—"Production credit associations not only have the responsibility of supplying their members with sound short-term agricultural credit for constructive purposes but it is also their responsibility to AVOID making loans for unwarranted expansion, speculative activities, and non-essential purposes that will add to inflationary pressures." Thus pointed out C. R. Arnold, Production Credit Commissioner of the Farm Credit Administration at a meeting of Production Credit officials in Washington.

"We have been going through one of the most profitable periods that agriculture has ever experienced," continued Mr. Arnold. "It has been easy for some farm and ranch operators to become careless and extravagant in their methods of doing business. Rising prices have obscured many of these situations. It may take only a moderate decline in prices of livestock and farm commodities to bring embarrassment to over-extended operators and their creditors.

"The farm operator who has made no progress during the last few years may be a poor credit risk and may be injured through the use of easy credit. In times like these, production credit associations can perform a real service to their members in giving credit guidance along sound and constructive lines. The associations would do grave injury if they were to encourage excessive use of credit through loans which cannot readily be repaid with some-

(Continued On Page 4 Col. 3)

Don't Take a Chance

The National Board of Fire Underwriters has issued a timely warning concerning fire hazards that are especially great during summer and early fall.

The fire rate in vacation cottages and resort hotels runs high—due almost entirely to simple careless ness. Many summer homes are far from fire departments, and once a fire gets going, a total loss often results. The only defense is constant watchfulness. Don't overload electric circuits with extra appliances. Don't use refrigerators and similar equipment which have been out of service for months without oiling them. And —above all—see that stoves and pipes are all protected from woodwork, and that fireplaces are screened.

Keep some sort of fire-fighting equipment ready at hand. If a fire is detected quickly, a garden hose or a hand extinguisher may check it before serious damage is done.

The best part of a vacation is getting out of doors. But, in time, there won't be any enticing out of doors to visit if we fail to control fires. Watch your smoking materials and never leave a camp fire until it has been thoroughly smothered with water and damp earth.

In short, don't take a chance. Then you'll have a happy, healthful vacation— and so will everyone else.

Farmer Awarded Merit Certificate By South Carolina Bankers Association

Washington, D. C. — James Archie, South Carolina farmer who has climbed up from sharecropping to the ownership of an 88-acre farm through the assistance of the Farmers Home Administration of the U. S. Department of Agriculture, was awarded a certificate of merit recently by the South Carolina Bankers Association for outstanding soil conservation work on his farm.

Farmer Archie, who lives near Chester, S. C., is the first colored farmer in the Catawba Soil Conservation District to receive the bankers award, reports E. N. Williams, State Supervisor of Extension Work with Negro Farmers.

Archie and his wife worked their 88-acre farm one year as sharecroppers and four as renters prior to 1942. They were paying three bales of cotton rent each year to a local bank which had charge of the croded and run-down farm. Then one day a representative of the bank suggested that the Archies buy the farm. They were told to talk it over with the county supervisor of the Farmers Home Administration.

"Figuring we had nothing to lose, I made a visit to the county FHA office," Archie relates. "After discussing the matter with the supervisor, I made an application to buy the farm." Soon the Archie's application was approved and they were on their way to owning their own farm. Today, they are well ahead of schedule in repaying the 40-year farm purchase loan.

During the summer of 1943, Archie asked the Chester County unit of the Catawba Soil Conservation District for assistance in making a complete soil diagnosis of this run-down farm on which he was breaking his back trying to eke out a living.

Technicians of the Soil Conservation Service made a map of Archie's farm which showed the production capability of each acre. This map was turned over to Thomas F. Carter, a Negro conservationist who understood not only the land, but also many of the problems which the Archie family faced. Carter assisted Archie in planning his farm field by field for a cotton and dairy program.

Terraces were built, and a four-

Displays Best Ham at Exhibit

Sharecropper Veteran Horace Savoy, center, of Maryland points out to Congressman Lansdale G. Sasscer of his district his prize-winning ham at the recent Maryland Ham and Egg Show. Looking on at left is Mrs. Ida Holland, first prize egg winner, and at right are two 4-H'ers. Thomas Barnett and John Wallace. The exhibit was held at Upper Marlboro, Md..

Farm Credit Helps Farmers Climb Out Of Debt And Into Ownership

Washington, D. C. — Thousands of white and colored farmers are being helped out of debt and into farm ownership by the Farm Credit Administration of the U. S. Department of Agriculture, says A. H. Fuhr, assistant to the governor of the agency.

Typical of many of the colored farmers who are being aided is Edward Turner of Talladega County, Ala., a former tenant who is now buying a farm of his own. When Mr. Turner applied to his Production Credit Association for a loan seven years ago, he still owed a local merchant $1,400 even after he had turned over his entire cotton crop of 11 bales, all of his corn, four head of workstock, a wagon, two plows, and other farm equipment.

The association conferred with the local merchant and arranged for Mr. Turner to pay off his old debt which finally boiled down to only $20. Then the association approved his application for a loan of $315. With the interest rate at

Farmer Increases His Net Worth Up To $10,000 By Conserving His Soil

Within 10 years, Prentis Monk, an Arkansas farmer, has increased the net worth of his farm from a mere $600 to about $10,000 by following sound soil conservation practices, reports H. C. Ray, Extension Service district agent of Little Rock, Ark.

A few years ago, Mr. Monk was really up against it trying to make ends meet, operating his 40-acre hill farm near Magnolia, says District Agent Ray. At that time, his farm wasn't producing even enough to feed two mules—his own and one he borrowed from a neighbor. Things got so bad that he had to work at odd jobs to buy groceries and pay the interest on a $400 mortgage on his small farm and three-room shack.

Then one day, he went to a farmers meeting being conducted by the County Extension agent. When the meeting was over, he went up to his agent and told him his problem. The agent helped him make contact with his Soil Conservation District office and

Horace Savoy Wins Commendation At Ham And Egg Show In Maryland

Washington, D. C.—Emphasizing the importance of a well-rounded live-at-home program in his address at the recent Maryland Ham and Egg Show, Congressman Lansdale G. Sasscer praised a young colored sharecropper veteran Horace Savoy, of his district for exhibiting the best home-cured ham on display at the show, reports District Extension Agent Martin G. Bailey. The exhibit was held at Upper Marlboro, Md.

"The farmer who usually gets ahead," said the Congressman, "is the one who isn't always running to the grocery store to buy things he could raise at home. This young veteran, who served in his country's armed forces for three years during the war and who has returned home and is now taking on-the-job training in order to be a better farmer, is to be commended for producing and curing the best ham on exhibit here," Sasscer declared.

The Congressman also praised the othed farmers who had products on display at the show. "This is evidence," he said, "that you are not counting on your tobacco crop to carry the whole farm load. But instead you are growing a larger part of your own food so that you can use your tobacco dollars to buy land, or improve your home and raise your level of living."

The show was initiated a year ago by County Agent James R. Taylor, who says it is part of his program of helping to stimulate more of the farmers in his county to increase their production of food for home use. This year the show was sponsored by veterans who are taking on-the-job training in agriculture under Taylor.

Veteran Savoy, one of County Agent Taylor's star trainees, has been share-cropping near Hall,

Asst. Sec. Chas. F. Brannan Says Nation Will Benefit By Removal Of Disadvantages

The entire Nation will benefit by the removal of the many disadvantages which handicap rural people, said Assistant Secretary of Agriculture Charles F. Brannan in an address last week before a meeting of rural and town people in Burlington, Ia.

In reviewing the Department's testimony on a long-range agricultural program before the agricultural committees of the Senate and House, Brannan said that a portion of that testimony was concerned with the disadvantages of many rural areas.

"We shall never achieve farm parity in living," he said, "unless we fearlessly tell the truth about farm conditions. Admittedly, agriculture stands at the peak of its all-time prosperity. Yet in 1946 the average per capita income of farm people was $779 compared with $1,288 for nonfarm people," the Assistant Secretary asserted.

"I believe firmly," Brannan declared, "that the interest of the entire Nation will be served by striving to bring about a condition in which rural areas are no longer disadvantaged in such elementary aspects of living as electrification, running water, housing, education, recreation, and medical care."

Take A Stand On "Moderate" Drinking

The menace of beverage alcohol is that its use may result in the disease known as alcoholism. What to do with the victims of alcohol is a public problem of the first order. Few hospitals are equipped for treating alcoholic patients. By common consent the jail has been substituted for the hospital. The public conscience has not been educated in the wisdom of studying the nature of the disease or of dealing with it at its source.

Alcoholics Anonymous is doing a noble service in reclamation of alcoholics, but the popular mind is callous to the frightful human cost of the liquor traffic, and rationalizes the situation by saying that drinkink has been with us since the days of Noah and will probably remain with us for a long time to come.

The liquor industry is a legalized business, one of the big industries of our coluntry. It pays enormous taxes to the government, employs labor, and furnishes a market for the products of the farm. It assists the officers of the law by insisting that automobiles do not drive when drinking, observes the time of opening and closing its bars, observes holidays, and in every way is a law-abiding institution—so they say.

The public mind is not shocked by the figures given by dependable statisticians. It is said on good authority that of the 100,000,000 of our population fifteen years of age and over, 50,000,000 drink. Of these, three million are excessive drinkers, and 750,000 are known alcoholics. Dr. Jellinek of Yale believes that 25 per cent of crime is due to alcohol. Dean Luther A. Weigle says that the menace of liquor is "greater now than it ever has been anywhere, or at any other time." The drink bill of the nation reached the appalling figure of $770,000,000 in 1946, which is more than the total of the amount spent by state and federal governments for public health and hospitals, plus all money spent under the Social Security Act, including old age assistance and help for the blind and crippled and dependent children, plus all the money spent by the Veterans Administration for 1944. This does not include the hidden costs of drinking such as part of the cost of crime, hospitalization of alcholics, accidents and absenteeism due to drinking, nnot mentioning money spent for bootleg liquor, all of which would add another billion or two.

It seems that a growing number of our population is disposed to blink at this dark picture, preferring to accept thee pleasing propaganda of the movies, newspaper and magazine advertising, and the flaming pictures of the billboards glamorizing liquor as a public benefactor, and escape from monotony and boredom, the freer from worry, fear, and inferiority, the concomitant of all "gracious" living, and other such false claims. In spite of this tissue of lies the ancient proverbs still holds: "Wine is a mocker, strong drink is raging: and whosoever is deceived thereby is not wise" (Prov. 20:1).

Fearing the growth of popular opposition the liquor interests are counseling moderation. One must know when to stop. In the exercise of self-control one strengthens his will-power and develops character, it is claimed. The doctrine is contrary to fact and experience. We know that the powers of inhibition are wakened when alcohol is taken into the system, and the fine edge of moral discrimination is blunted. In a men's Bible class in a Pittsburgh church one of the members reported in the writer's presence that an eighteen-year-old girl of a good family said in his hearing that she expected to attend a party that night. She would drink till twelve o'clock and after that she "didn't care what happened."

There are multitudes of otherwise good people who, while deploring the excessive use of alcoholic beverages, see no harm in an occasional beer or cocktail. When to refuse to drink would throw a wet blanket over the party or invite jibes and innuendoes, a special brand of courage is needed for one to stand up to his conviction.

To drink or not to drink poses a question of far-reaching consequences, both to oneself and to his neighbors. He who can "drink or let it alone," usually does not let it alone. Total abstinence is far better and safer. Besides, as a Christian one must have regard for his neighbor who may be less endowed with moral stamina than himself. The apostle Paul refused to eat meat if in so doing he caused his brother to offend. The same principle holds in this case. One who drinks regardless of the power of his example is a consummate egoist and violates the law of brotherly love which the teaching of Jesus enjoins upon us all.

It is wrong to drink even in moderation. The only way is total abstinence.

He Giveth More

"He giveth more grace," James 4: 6
"He increaseth strength," Isaiah 40: 29
"Mercy unto you, and peace, and love, be multiplied," Jude 2

He giveth more grace when the burdens grow greater,
He sendeth more strength when the labors increase;
To added affliction He addeth His mercy,
To multiplied trials, His multiplied peace.

When we have exhausted our store of endurance,
When our strength has failed ere the day is half done,
When we reach the end of our hoarded resources,
Our Father's full giving is only begun.

His love has no limit, His grace has no measure,
His power no boundary known unto men;
For out of His infinite riches in Jesus
He giveth and giveth and giveth again.

—Annie Johnson Flint.

Dying Testimonies Of Native Converts

Winifred Higginson

From "Alliance Weekly"

Miss Vaughn of China gives this instance. During a meeting of several days' duration in China in 1904 the audience consisted of the most stupid and ignorant of Chinese women. Among these a Mrs. Jang seemed more stupid than the rest. Because her husband had desired her to know of Christianity, she had come with her two children.

"There was little time for individual work. Our reliance was on the words, "If ye abide in me, and my words abide in you, ye shall ask what ye will, and it shall be done unto you." After four days Mrs. Jang returned home a new creature in Christ.

"Some months later, while we were holding similar meetings in a neighboring town, she again appeared, this time with three children and a dog. She remained for four days, got what she could of truth, and went home.

"A year later she became ill, and her family was intensely bitter because of her change, and that she had unbound her feet. They persecuted her by all sorts of little meannesses. But through it all she maintained a bright testimony, only grieved that her dear ones would not receive what so thrilled and comforted her. The disease had about done its work when I visited her village, but I received a welcome of boundless affection from her. Days passed and the end drew near. We prayed only for a peaceful passing; a lifting of the grief for those who had rejected her testimony. I made my supposed last visit to her. We shall never see our friend again. She is very near her heavenly home,' I had said.

"Early the next morning when we went to see her, we were amazed at the progress she had made during the night. To our intense surprise, she regained her health rapidly ad although never vigorous again, she lived for nearly a year to praise and glorify her Lord. She had kept the faith and believed that God could use her and in some mysterious way she was spared for a short time longer to do His will.

Prayer

O God of Life, we thank Thee for beautiful little things which we never dreamed could make us so happy, and for the way the stars shone on long hard stretches of the road we had to tread.

We thank Thee for the small expectations which ended in great delight; for the visitations of friendship which took us by surprise in this quarreling world of ours, and for the success which startled a heart schooled to face frequent defeat.

We thank Thee that when we prayed for courage to face the worst there was often the infinite mercy so much less than the worst; and we thank thee that some of our desires were not satisfied because a wisdom deeper than our own withheld what we wanted for the moment and gave us what we needed forever.

We bless Thee that, bereft of some things we felt we could not live without, we have had bestowed upon us other things to enable us to live on—a vision in the restless night, a quiet heart in the dreaded tumult, an inspiring thought when we were at our wits' end, a sufficient grace in spite of our weakness.

We praise Thee for that within us which, bloody and also bowed, has not been utterly conquered and never shall be, because those who love us make us continually ashamed of lying in the dust.

Bless our future days to courage in our own troubles and kindness in the troubles of others.

Bless our work to a little splendor and our homes to great loving.

Bless our country to responsible freedom and our world to new hope.

Forgive our sins against Thee and against one another; and lead us gently down the years, out of the good that is into the better that is yet to be. For Christ's Sake. Amen.

First Knowledge Of The Bible

Said Secretary Betts of the American Bible Society: A young Yugoslav, with whom I shared a seat on the airplane, asked me politely about my business occupation. I told him I was a representative of the American Bible Society. "Bible," he asked, "What do you mean—Bible?" He had never heard the word before. I tried to explain: the Bible is a book of sacred writings, and tells the life story of Jesus of Nazareth. Apparently he had never heard the word "Jesus." So I spent a few minute telling him something of Jesus Christ. Then I had an inspiration. I happened to have in my brief case copies of the Gospel of St. Luke and St. John in Serbian. They had just been published by the Bible Society. I offered him a Gospel. His eyes lighted up as he recognized his own language, and be begged to keep it. I assured him it was his, and gave him the other Gospel to go with it. God grant that it may prove to be but the beginning of a new and richcer chapter in his life?

The Busy Train

By Marian Kennedy

Huffle, chuffle goes the train,
Huffle, chuffle, puff!
Starting oh, so very slow,
Juff! Chuff! Huff!

Huffling and chuffling
With little puffs so short,
Juffing down the shiny track
With a snuffle and a snort.

Clitter, clatter, clitter, clatter,
Clickety, clack, clack!
Gliding round the corners,
And clicking down the track.

Whistling at the crossings,
Hurrying on again,
Huffing, puffing, clicking, clacking—
What a busy train!

CHOICE WORSHIP SERVICES AND PLAYS

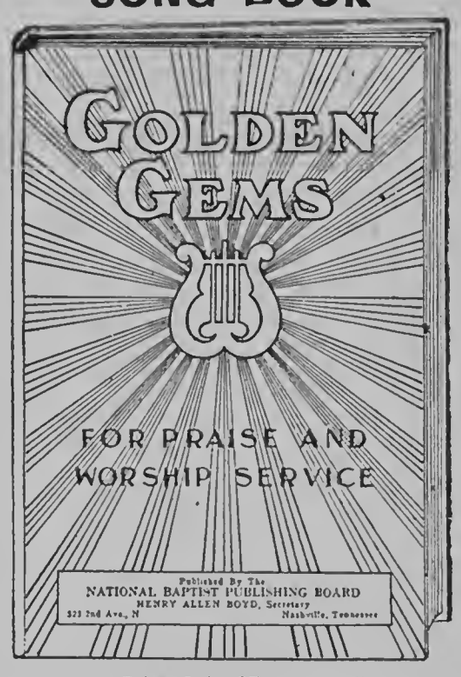
A book that fits in with the urgent needs of the present day. Written by various authors familiar with church requirements. Among its contents are several choralogues: The Woman at the Well; The Nativity; The Prodigal Son; etc. Tribute to the Rural Church is a beautiful tableau. The Little Church of Childhood is a plea for the continuance of the rural church. The Melting Pot is a patriotic number climaxing with the church's contribution to the country. Others are for Lord's Day observance and general occasions. A valuable book. 40c.

PLANS AND PROGRAM BOOK

Here is a collection that will provide an abundance of program material to those entrusted with the responsibility of preparing suitable programs for socials, Sunday School entertainment, Young People's Societies, etc. It is a book for many occasions and contains 142 pages

Price 60c per copy

OUR NEWEST AND MOST POPULAR SONG BOOK



Price Only 35c per copy

NATIONAL BAPTIST HYMNAL

JUST OFF THE PRESS

Responsive Reading

and other valuable information never contained in the book before, are given in this Revised Edition for the use of those who know and appreciate the best in music. New Songs have been added to the well known and best loved familiar airs and songs. When you need new books for the choir, just think of the Revised National Baptist Hymnal, the best book you could buy anywhere for all occasions.

A Little Peacemaker

David took the beautiful red apple from his mother's hand with a big thank you. "It's the last one, Son," she smiled "When I go to market tomorrow I will certainly get some more apples like those." "That suits me," laughed David, as he hastened out on the back porch to eat it.

He was about to sink his teech into its sweetness when he heard half angry, half sobbing young voices. "It's mine, you give it to me," cried one. "I want it!" sobbed another little voice.

Two small neighbor boys came around the house, Chubby Tommy looked as if his heart would break. And David knew that the new toy Tommy was trying to resuce from Peter was his own, the one which his father had given him only that morning. It was easy to see that its shining newness had attracted little Peter, who now was holding on to it with all the strength his small hands possessed.

"See what I've got!" said David. holding up his beautiful red apple. At oncc the crying ceased and the wet eyes widened with intrest. I'll tell you what I'll do," continued David. "If Peter will give Tommy back his toy, I will show you both how I can split this apple in two without using a knife."

Peter let go of Tommy's new toy, and David began twisting the apple in his hands until, quick as a flash, it broke right through the middle. The little boys laughed out loud as David handed them each a half of his apple.

Then it was David's turn to laugh as the little fellows ran off, hand in hand. He was still laughing when he entered the kitchen. "I'm glad to meet you, Mr. Peacemaker," said Mother with a twinkle in her eye.

"Peacemaker?" asked David.

"Yes, of course," answcred Mother "I saw what happened just now from the window. Remember what Jesus said, David. 'Blessed are the peacemakers; for they shall be called the children of God."

"And I guess blessed means happy," said David, as he thought of Tommy and Peter, the best of friends oncc more.

How I'm Bringing Up My Son To Live In A World of Many People

By Perry Como (singing star)

Note to Teachers: We believe your students will be impressed when their favorite singer (and he is an idol of the younger set) expresses himself in this democratic fashion.

A few hundred years ago, a guy by the name of Columbus made a trip to this country. He came from Europe and started a custom that has grown to pretty big proportions. The neverending flood of immigrants from all parts of the world since 1942 has included all races, all colors, all creeds. Checking in at our ports have been Catholics, Protestants, Jews and Moslems—Negroes, whites and yellow complexions—Europeans, Asiatics and Australians. A mixture that has made America a great country—a haven for the oppressed and underprivileged.

I have a boy six years old of whom I'm pretty proud. In that respect, I guess I'm no different from millions of other parents. I'm proud of the way he smiles, I'm proud of his intelligence—I'm proud of many things out him. But I'm proudest of an outlook that he's developing—slowly but surely—about his fellow man.

From his earliest days, my wife and I have done our best to impress on Ronnie that the next fellow is as good as he is. That the signers of the Declaration of Independence weren't kidding when they said, "We hold these truths to be self-evident, that all men are created equal, they they are endowed by their Creator with certain inalienable rights, that among these are Life, Liberty and the pursuit of Happiness."

Our country has just gone through a terrible war—a war to whose purposes the Comos heartily subscribed. Not only did we fight to rid the world of tryants but to insure minority people a place in the sun. To insure them the right to hold their heads high with a dignity intended for all humans—not only the majority. Ronnie is only a young boy, but we are constantly striving to explain to him, the language he'll understand, what it was all about—that Abraham Ievine is as good as Michael Rafferty, that George Washington Smith has the same rights as Angclo Ferraro.

Of coursc, words are important but they can never be an adequate substitute for action. That is why my wife and I try to translate our theories into action. Children are extremely imitative—particularly when their parents are involved And when we have friends visiting of all different nationalities and faiths, Ronie gets the idea. He goes out and chooses his friends on the same basis that we do. His only test, learned from us, is, "Is he a nice guy?" Ronnie doesnt even think in terms of, "What's his nationality?"

That's why we're proud of our son. He is learning to be a good citizen in the fullest sense—not only of this country but a citizen of the world. He is learning how to live with other people.

The Compassionate Heart

By H. H. McConnell

The world is moved toward Christ only by those who care.

He loved me and gave himself for me." How the heart of Paul must have leaped within him as he penned these words. What a sense of wonder must have possessed him as the magnitude of this thrilling conception gripped his mind. Christ's love is an individual love. It is not an impersonal love for the mass of men, but it is channeled down to the individual life. He is the individual Saviour of the individual soul.

There were two things which were a continual source of wonderment to Paul. He was amazed that the grace of God had singled him out and conferred upon him the riches of grace and the riches of glory; and the sense of wonder never left him that he should be entrusted with the good news for others. "Unto me who am less than the least of all saints was this grace given to prcach unto the Gentiles the unsearchable riches of Christ."

And what an amazing thing it is that the believer is privileged to be an interpreter to the world of the compassionate heart of the Master. "As the Father hath sent me," said Jesus, "even so send I you." Let your mind dwell on that and try to encompass its meaning. We who bear his name before the world are to be the interpreters of his grace and power and love. We are to reeal these qualities to others. Round about us are "those for whom Christ died" who are equally precious in his sight as those who are his own.

Physial and Spiritual Need

No wonder Paul says, "Put on, therefore, as God's elet, holy and beloved, a heart of compassion.' Reently, my spirit was stabbed broad awake by an incident in the life of Wilfred Grenfell. He had been taken aross the bay by an old fisherman to attend a man who was dying. They were cold and wet and hungry when they arrived at the fisherman's home. Tea was served to Dr. Grenfell, and they apologized that there was no sugar or milk. In the home were children pooryl clad and looking undernourished. Dr. Grenfell climbed the ladder to the second floor and found an old man dying of cancer of the throat. His aged wife her eyes blinded by cateracts, was tenderly ministering to him. When Dr. Grenfell returned to the first floor, he asked the fisherman who had brought him, "Is that your father?" "No," was the laconic reply. "A relative then," persisted Dr. Grenfell. Again the answer was in the negative. Finally, the fisherman volunteered the information that he was a neighbor. "How long has he been with you?" queried the doctor. "About a year," was the answer. "Does he pay for their food? asked Dr. Grenfell, only to receive the answer, "They have nothing." Said the doctor in wonderment, "Why do you share your living with them when you do not have enough for yourself and family?" And the old man answered with this piercing question, "What would do you, doctor?"

What would you do? what am I doing? That is the question every one of us must answer in this day when there are so many millions of men, women and little children who lie down hungry each night.

But tragic as is physical hunger, the unfilled hunger of the soul represents a greater tragedy. Our age has become sensitive to poverty and pain, but indifferent to sin. We are sympathetic to the hunger of the body but callous to the greater tragedy of soul hunger and spiritual starvation which is all around about us.

Our Lord never neglected man's physical needs, but his supreme concern was to meet and satisfy those deeper hungers of the soul, and how the church—yes, how we as individual Christians—need to recapture the fervent, glowing, yearning passion of our Lord in his love for men.

Renewed Subsoil Required

We have talked much about a new world. We have made our blueprints and day dreamed a great deal about a world brotherhood which shall be characterized by unselfishness and peace "Where man calls man his brother and loves as himself another." But our dreams are always rudely interrupted by one stubborn, ugly fact —the fact of human sin. All through history the blueprints of a better world have been destroyed in the blazing inferno of the wickedness of the human heart. There is no power to deal with that but the redeeming power of the cross of Christ.

In a great apartment project in New York City, a slum and industrial area was cleared and impressive apartment buildings arose on that site. The plans called for beautiful landscaping. The ground was preparcd, top soil was brought in, and the grass was planted. It flourished for a time, and then bare spots appeared, and it was not a healthy loowing lawn. The soil was analyzed. It was discovered that drippings from the oil tanks formerly located there had fouled the soil. Heroic remedies were undertaken. The soil was removed in the depth of siv feet, and new healthy soil was put in its place. The project cost -200,000. They knew that there was no use to plant grass and trees and bushes and try to produce beauty on the surface when the soil beneath would not support it. And have we not learned that we cannot build a world of righteousness and beauty and peace out of soil of unredeemed lives?

As a must in any blueprint for the building of a new world, there must be the foundation of bringing men one by one into a saving knowledge of Christ and to an honest attempt to live life as he would have lived. and that requires the channel of loving compassionate hearts.

When that type of compassionate zeal possesses those in the pulpit and those in the pew, the love of Christ has found interpreters. The world is moved toward Christ only by those who care and who care intensely. There rises a cry from our stricken world today to those who are Christ's, "Put on, holy and beloved, a heart of compassion."

The End of Darkness

Frances Fitzpatrick Wright

Perhaps next to the bare necessities of food, fuel, clothing, and shelter, men have worked hardest for light.

First they had only the light of the campfire; then they made torches of wood. After a long time, they made crude greese lamps of clay, or candles of tallow. A great step forward was taken when kerosene lamps were perfected. In time kerosene lamps were replaced by gas, piped intto the houses for illumination. Gas lights, however, were discarded almost entirely when Edison, the great wizard of electricity, perfected the incandescent lamp. Electric light has indeed turned night into day; bu the use of it, factory work can be done almost as well by night as by day; doctors can operate at any hour, airplanes can land safely out of a midnight sky. Man has conquered physical darkness with artificial light.

And what of spiritual darkness? From the earliest times, men have yearned and searched for an inner light to guide them out of the larkness of fear and ignorance, out of the darkness of evil thoughts. Far back in the Old Testament we find this cry for help. "O send out thy light and thy truth. let them lead me." And in Psalm 119, these words "The entrance of thy words giveth light."

Always, light has been the symbol of goodness and truth; darkness has been the symbol of evil and ignorance. When the good old priest Zacharias speaks of the birth of the Christ child he says, "The dayspring from on high hath visited us, to give light to them that sit in darkness and in the shadow of death."

When Jesus grew to manhood and realized fully the power of evil and the darkness it brings into human souls, his whole purpose was to bring the light of goodness and truth into every seeking soul. He said, "I am the light of the world," and another time he reminded his followers of their obligation to the world, saying, "Yc are the light of the world . . . let your light so shine before men that they may see your good works and glorify your Father which is in heaven."

It was many years after Jesus' earthly career was finished that John wrote of him, "The darkness is past, and the true light now shineth." The long search for spiritual light ends in Christ for each individual who finds him. His spirit enlightens the understanding and thc conscience.

Kate Shelley's Bravery

It was July 6, 1881, Kate Shelley stood by the kitchen window of her home in Boone, Iowa, watching a terrific storm. All lay long the wind had blown; the ran had descended in torrents, and as night came on, it seemed to grow worse. Kate had seen houses falling trees uprooted; cattle swept into the raging river, already six feet above its normal height. Men had been watching Honey Creek Bridge over the river all day, but it had stood the strain.

The lightning was blinding, ad the thunder was so loud that Kate had found it impossible to make her mother hear her when she talked. The night was very dark and Kate stood by the window wishing that some man were to be in their home to protect her mother and the little ones during the night ahead. A girl of 16 didn't seem of much use in a storm such as was raging outside the window.

due, and it is the way of the big headlights of an oncoming freight train as it rounded the curve. Then the lights suddenly disappeared; the train didn't come by the house as usual.

"Mother;" screamed the girl, "Mother! Honey Creek bridge must have gone down! I saw the freight's headlights! Now they are gone, and the train has gone, too- What shall we do, mother? The express is soon due, and it is the da yof the big reunion. It will be crowded, mother, what shall we do?

"What can we do, child? asked her mother, shivering with dread. "There is no one here to go."

"Then I must do something,' cried Kate. 'The lives of all those folks on the train depend on me. There is no other house this side of the bridge."

"What could you do in a storm like this?" asked her mother again. "You couldn't stand, Kate. You couldn't get to a place where you could stop the train."

"I must try to get to Moingona," said the girl. "That is only a mile away, and there is an operator there."

"But the trestle!" warned the mother. "Remember you could not cross it in the daylight. How could you make it in the darkness and storm?

"I can only try," answered Kate, trying on an old hood over her head, and putting on a great coat that had belonged to her father. "You know it is what I ought to do," and she opened the door, letting in a great gust of wind and rain. Her mother watched her from the window, praying for Kate, trying to believe that she would come back again in safety.

Kate went first toward the bridge. She had been right in her surmise that the bridge had been swept away. There lay the freight, partly submerged in the water below. The bridge had been carried down the stream, and in the flashes of light she could see the great steel skeleton rearing its head beyond the freight train. The water was crashing against the piers as if to push them away, also.

Quicky Kate turned to run along the track toward the trestle, but the storm now beat directly in her face, and progress against it seemed almost impossible. To breathe was difficult; at times she was driven back over the very same ties she had passed. A tree. crashing down behind her, made her dazed and weak. The way seemed endless. Rounding a curve in the darkness, she knew that the thestle lay ahead of her.

The trestle! It was five hundred feet long and below it the Des Moines River was thundering and pounding against the abutments. By the light of the occasional lightning, she could see where the trestle began; then all was pitch black. Finding it impossible to keep her balance, she dropped to her knees. The rain dashed in her face, making it hard to watch the track when the light came. Very cautiously, yet as hastily as possible, she went crawling along the trestle on the slippery rails. Once her hand went between the ties and she bumped her face on the rails, cutting it badly, and making her head swim Would she never get across? The way seemed endless.

At last her hand felt solid ground, and Kate Shelley gave a cry of Joy. Not a moment was to be lost. She jumped to her feet and hurried toward the small station a quarter of a mile away. What mattered if if shc fell? If she lost a shoe? If she tore her clothing? She was trying to save the lives of men, women, and little chiludrcn

Dashing into thc little station, she gasped,

"Honey Creek Bridge has gone! Stop the express! The freight train is in the river!" Then she fell unconscious to the floor.

So the long express train, with its crowded cars containing many of the leading citizens of Iowa, came to a full stop less than two miles from the trestle, and the passengers, as they sat in the cars and waited for the storm to abate, learned of the courage of that girl of sixteen who had risked her own life to stop the train.

When, later, the Legislature of Iowa presented her with a golden medal, and also with a purse of gold which had ben contributed by those whose lives she had saved, Kate Shelley thanked them kindly, and then said—:

"I wasn't really as brave as you have made me out to be. Mother has always taught me to do the thing that I thought I ought to do, no matter how hard it was going to be; that is what mother has always done, too. So I just did what I knew 1 ought to do."

Recipe for Rest

When at night you sleepless lie,
And the weary hours drag by—
Lift your thoughts to God above.
Bending down to you in love.
Feel his presence by your bed—
His soft touch upon your head.
Let your last thought be a prayer,
As you nestle in his care;
Ask him all your way to keep,
Then—why then—drop off to sleep

When the trumpet is needed the music of the flute will not suffice. Too long the flute has been the dominant instrument in the organized orchestra of Christianity. —Dick Shepard (quoted by G. Bromley Oxnam.)

THE FORUM

The Modern Farmer

Published monthly by the Modern Farmer at Nashville 3, Tennessee.

Farmer Increases

(Continued from page 1)

apply for assistance. A Soil Conservation Service technician came to his farm, studied it carefully, and then made a map of it, planning a cropping system for each acre in terms of the needs of Mr. Monk and his family and in line with the capability of his land.

Part of his farm was selected for meadow, three acres of eroded land were devoted to pine seedlings, and the remainder was terraced for growing cotton and corn rotated with soil building crops. By 1938, he had paid off the $400 mortgage and made the downpayment on 80 acres of woodland. Six years later, Mr. Monk was out of debt and had built a modern, eight-room home for his family of 11, and a new barn for his livestock.

Last year, he was acclaimed the champion soil conservation farmer of Arkansas and was awarded $100 at the Log Cabin, Ga., Soil Conservation Jamboree. In addition, the Arkansas Bankers' Association presented him a certificate of merit, and the Dorcheat Soil Conservation District gave him a $100 prize for outstanding soil conservation work.

By farming the conservation way, Mr. Monk now produces annually about 14 bales of cotton. $700 worth of calves and hogs, 600 bushels of corn, 800 bales of lespedeza hay, 500 bushels of sweet potatoes, 350 bushels of Irish potatoes, 50 gallons of syrup, five gallons of milk a day for his family, poulutry, eggs, and fresh fruits and vegetables for a well-balanced diet.

"When I applied to the Soil Conservation Service for help," Mr. Monk says, "everything I owned, including my land, wouldn't have brought $600. Today, my farm and home and livestock would easily bring $10,000.

His livestock consists of four horses, eight milk cows, eight calves, two brood sows, 21 pigs, and 100 chickens.

Farmer Awarded

(Continued from page 1)

year strip rotation was set up which called for planting every other terrace at intervals in small grain followed by lespedeza, a hay crop. "Grain and lespedeza will rebuild land faster than anything I know," Mr. Archie says. As proof of this statement, he says that after putting his soil conservation program into effect, his cotton yield rose from about a half bale to the acre to a bale and a half per acre.

With the increase in grain and hay which resulted from his soil sonservation program, Archie began launching his dairy program. Today, he has five milk cows. Besides getting plenty of milk for their seven children, the Archies have a milk check of from $25 to $40 coming in every month from a nearby creamery to which they sell milk.

The improved farm practices which the Archies are carrying out are reflected in better living. Hams and sides of bacon may be found in their smokehouse yearround, and on the pantry shelves are hundreds of quarts of canned meats, fruits, and vegetables. "We butcher four or five hogs every year and we usually can a calf and about 800 quarts of fruits and vegetables," say the Archies.

In 1944, the family built a new home made of concrete blocks. It sits on a ridge overlooking most of their farmland which neighboring farmers come to look at regularly to see how they are conserving soil.

Farmer Archie is high in his praise of those who gave him a helping hand in getting started and are still aiding him. Special mention is made of Soil Conservation Service, Extension Service, the Farmers Home Administration, and the Production and Marketing Administration. He uses his PMA payment largely for terracing and pasture improvement. He was the first colored farmer in his county to construct terraces with a two-horse turnplow and get them approved for payment the first year.

His county agent has asked him to be a leader in the soil conservation group which is being organized in his community. His answer is, "I am ready and willing to do what I can to help other farmers get on the road to better living on the farm."

The Wicked Device

One of the whiskey distillers took advantage of "Father's Day" to advertise widely, using the caption "Are You Really Playing Ball With Your Son?" It challenges fathers to "wise and sensible drinking." The idea is, of course, to set an example to the son. It would seem to us that thoughtful American citizens ought to express frankly their disgust for this sort of propaganda. There are today many thousands lyiny in drunkard's graves who were taught by their fathers hiw to drink "moderately." As there stretched out a helpless drunkard on the floor of a home, the father confessed, "I saw my own sins stare at me through the eyes of my son. By the way, what other business is there that requires a warning concerniny its products? What the manufacturer needs to warn his customers to be "moderate." What maker of shoes needs to warn his customers to be "sensible." The Better Business Bureau has a gigantic problem on its hands in dealing with liquor advertising, and it had better get busy if it is to preserve its reputation as the upholder of business ethics in advertising.

Farm Credit Helps

(Continued from page 1)

4½ per cent, he was able to repay his production credit loans at the end of each crop-year and have something left over to put aside.

By last year, he had saved up enough to start buying a farm of his own. Also, he has workstock, new farm equipment, milk cows, hogs, poultry, and a year-round garden, says Mr. Fuhr.

As of last December, over 400,000 white and colored farmers held membership in the Nation's 503 Production Credit Association. During the year, members borrowed a total of $757,611,000 on which to help run their farms.

Mr. Fuhr left last week on a trip through Kentucky, Tennessee, Missouri, and Arkansas where he will confer with rural leaders in an effort to acquaint more farm people with the credit facilities of his agency.

Horace Savoy Wins

(Continued from page 1)

Md., even since he returned from the service. Last year, he netted $1,500 as his share of the tobacco crop he raised. "I've salted some of it away," said the young veteran, "to help buy a farm of my own in the next year or two, if I can find one at the right price."

In placing two blue ribbons on Savoy's 35-pound dry-cured smoked ham, the judges declared that his product was by far the best piece of cured pork on exhibit. Savoy, who has just turned 25, said his prize-winning ham was one of four he cured last fall as part of his home-grown food supply.

While the young veteran was taking first place with his ham, his 23-year-old wife, Mrs. Roberta Savoy, was winning second place with her eggs. First prize in the egg contest went to Mrs. Ida Holland of Brandywine, Md.

When Mrs. Savoy was asked how much she spends each week in feeding her family of four, she replied, "Sometimes as much as Two Dollars for sugar, flour, and a few other things we can't raise, but there are many weeks when I don't have to spend any money for food."

Explaining how her live-at-home program works, Mrs. Savoy said, The landlord has cows and he furnishes us milk; we have about a half-acre garden from which we gather enough tomatoes, kale, beans, and other products to meet our year-round vegetable needs. "You see," she pointed out, "I can about 200 quarts of fruits and vegetables every summer."

The Savoy's have two boys—one six-weeks-old and the other, four years. "I want to give my boys a start on the land," the sharecropper veteran said, "My parents have 15 children, and, of course, they couldn't help us much. But it's going to be different for my boys," he declared.

Before going into the army, Savoy was employed in a shipyard, however, he was reared on a farm nearby where he now lives. "I just wanted to get back on the land," said the veteran, 'to see what I could do."

Overlending Can

(Continued from page 1)

what lower agricultural prices.

"The future progress of associations and the long-term benefit they will be to agriculture depend upon how soundly they make and service short-term loans to their members."

The Religion Of Thrift And Savings

By William Pickens, U. S. Savings Bonds Division Treasury Department, Washington, D. C.

Oakland, Cal—Out of the strength of the individual members come the strength and power of the church; and out of the power of the churches come the power, the influence and the honor of the church association or the denomination. That means that the first link in the chain of power for the church and the denomination, is the power and security of the individual members. The stronger the individual, the stronger is his church and the stronger is the church denomination to which that church and that member belong.

This is very true and obvious in the economic sense: the poorer the membership in this world's goods, the poorer the preacher, the smaller the salary, the weaker the sermons, the smaller the congregation and again the poorer the church treasury. The small congregations and the discouragement of the membership mean a still poorer church. And so, the vicious circle turns on.

To raise the tone and standing and future of the church and the denomination, any uplift all round and all the way through must begin with the individual member. Give him a better economic foundation, more economic security and better hope for his own future, and you help the future of his church every other thing to which he belongs. Show me a church today whose members hold the most Government Bonds of that E, F and G variety, and I will show you the church which not only stands at the top now, but that also has the outlook for standing ahead ten, twenty and thirty years from now.

In the United States there are between 3 and 5 million Negro Baptists, constituing one of the best organized churches in the world today. Suppose the great and loyal leaders of the Negro Baptists in America should start a movement to have every member enrolled in a Baptist church, anywhere, also enrolled in the U. S. Treasury Department as the possessor of one of even the smallest Bonds, like that $25 E-Bond; what a stability that would give the great Bapt. Church for a hundred years to come, and the first hundred years would insure the standing of that church for many generations following the first hundred years.

An E Bond for $25 costs only $18.75, which means that a Baptist with five children could ultimately see that there was a Bond in the name of each member of the family in about half a year by buying one Bond each month. For every three dollars which he put into E Bonds, the family would get back four dollars at the maturity of that Bond.

And do our good church people know that F and G Bonds may be bought also in the name of the church or of any other organization which the purchaser of the Bond wishes to assist? The E Bond which can be bought only in the name of one or two individuals, pays a little more than three percent per annum when held to maturity of the Bond; but the F and G Bonds which may also be bought in the name of organizations pay two and one half percent per annum. This is good interest all round, from the best Bank in the world—The United States Government. That Bank is as safe and sure as the very life of the United States itself, and to most Americans that means as safe as, if not safer than, anything else in this world of ours. Through this Bond method, the security of the individual is made commensurate with the security of his country.

This is a good point at which to commend the far-seeing leaders of our Negro churches, who have led their members, by word of mouth and word in print, to deposit as much of their hard-earned money as possible in the E, F and G Bonds of the United States Treasury Department. That is true of all of our churches but is notably true of leaders, like Drs. G. L. Prince and Henry Allen Boyd of one wing of that Church and Drs. D. V. Jemison and W. H. Jernagin of the other great wing of the Baptists. These men are wise enough to be "making hay while the sunshines" and to be storing up blessings and opportunities for future leaders and coming generations of their churches.

William Pickens, Director, Interracial Section U. S. Savings Bonds Division., Treasury Department Washington, D. C. , August 9, 1948

Gallatin Soldier, Killed Overseas, Back For Burial

Gallatin, Tenn.—Sgt. Peter Wiley Vertress was laid to quiet rest, Thursday, Aug. 26th, in Gallatin, Tenn., by the side of his illustrious father, the late Rev. Peter Vertress. His body was brought from the Eastern Theater of War where he was killed in service some three years ago.

Dr. J. N. Rucker the outstanding Baptist preacher orator of Natchez, Miss., served as Master of Ceremonies and delivered a matchless eulogy wherein he depicted his brother-in-law as a brave soldier for America and God Almighty. Dr. T. J. Griffin of Chicago (a second brother-in-law) delivered the main eulogy and placed his deceased brother-in-law by the side of Abraham Lincoln and Jesus Christ who gave their lives in a combat for the freedoms of men. Mrs. K. B. McKissack sang and the Rev. C. H. Bell of Indiana offered prayer. The obituary was read by the soldier who accompanied the body home.

His distinguished mother, Mrs. Diora Vertrees; his sisters, Mrs. J. N. Rucker, Mrs. J. T. Odum and Mrs. Bertha Griffin along with his brother, R. C. Vertrees sat together in the church which their father pastored and built and sobed their last regrets over the flag draped casket of their beloved brother and son. Friends from all walks of life were there to say goodbye.

NEW FARM BILL EXTENDS SUPPORTS ON BASIC CROPS

The new farm bill, passed in the final hours of the 80th Congress, extends price support on basic crops, Carl Fry, state chairman of the PMA said today.

Price supports at 90 per cent of parity were maintained on wheat, corn, cotton, peanuts, tobacco and rice, Fry said.

The program is effective until June 30, 1950.

Cotton had previously carried a price support of 92.5 per cent of parity.

Irish potatoes harvested before January 1, 1948, milk, milk products, hogs, chickens and eggs will all be supported at 90 per cent parity until January 1, 1950.

Fry said that under the new legislation price supports for burley tobacco will continue at 90 per cent of parity indefinitely. The bill provides for the continuation of supports for fire-cured tobacco at 75 per cent of the burley loan rate and dark air-cured tobacco at 66 2-3 per cent of the burley rate. The bill provides for proclamation of tobacco marketing quotas on present quota tobacco, regardless of supplies.

Control of Insect, Pests Becomes Gardening "Must"

By Dr. Floyd Bralliar,
Garden Editor
The Nashville Tennessean

It has come to me that, one of the "musts" in gardening is the control of insects.

The insecticide business has grown to huge dimensions, and many new companies are organized every year. Many research men are working on the problem of making or discovering some new material that will be more effective and simpler to use than anything already on the market, and each year sees several contenders. Most of them are more or less effective in killing insects, but some are so deadly poisonous to men and other animals that they must be used with extreme care. Fortunately we do not have to rely on these poisonous insecticides, whether new or old. There are two well known insect killers that will do the work without danger of poison to anyone. Either one of them will do this work when used alone, but they are much more effective when combined.

Persian Powder

The first of these is pyrethrum, the old Persian insect powder, that was widely used 100 years ago. The other is rotenone. Rotenone has been used in India and in European gardens for years before it was introduced into this country. Usually under the name of Cubor. Pyrethrum is not poisonous at all, and rotenone is so slightly toxic that we may consider it non-poisonous. Both pyrethrum and rotenone can be had in dust or liquid form.

A single application of rotenone insecticide every week will control mast insect pests of the garden without danger to anyone. If we wish to be doubly sure we use a combination of rotenone and pyrethrum. It isn't necessary to know all of the names of the insects or the time that each kind may be expected to appear. Just apply your insecticide every week and you can control the pests.

Rotenone Effective

Rotenone will control the Mexican bean beetle, the shot beetle that eats holes in the bean leaves, flea beetles on tomatoes, radishes, carrots, beets and plants grown for greens. It will control spotted and striped cucumber beetles on melons and squash, caterpillars on cabbage, broccoli, cauliflower and lettuce, aphids on turnips, and melon worms and pickleworms on cantaloupes.

Plant lice or aphids are not always killed by rotenone but they are very easily killed by pyrethrum, or by a combination of rotenone and pyrethrum. Should you chance to find cabbage aphids, be sure that you use either pyrethrum or a mixture of pyrethrum and rotenone. Nicotine sulfate will do the work, but nicotine is a deadly poison and there is always a risk in using it on vegetables that are to be eaten.

DDT Untested

DDT is one of the most effective insecticides we have as it gives good control over most insects, but as we do not know just how poisonous it is, we do not like to use it on any leafy crops that are to be eaten or on beans, peas, beets, and carrots. It is very effective in controlling insects on potatoes, and when used on corn it will check European corn borers, corn ear worms, and Japanese beetles, but it is not safe to use on tomato vines or any of the squash or pumpkin family as it may injure the foliage.

In some regions, harlequin bugs do great damage to the cabbage family and squash bugs do great harm to cucumbers, melons, squashes and pumpkins, and as DDT should not be used on these, and rotenone may not be sufficiently effective, we may use a new powder known as sabadilla. Sabadilla is not expensive and is now plentiful enough to make it easy to get. In fact it is being used quite widely.

Cryolite Widely Used

Cryolite is another insecticide that is being widely used in the control of Mexican bean beetles and Colorado potato beetles. It is sometimes cheaper to use than rotenone.

Every householder should use DDT freely, both in and out of the house, in the control of flies, mosquitoes, cockroaches, bedbugs, and similar pests, and if sprayed on the ground around newly set vegetable plants, or if sprayed on the ground just before the plants are set, it is very effective in the control of cut worms. The soil should be sprayed for at least 8 inches around the plant. No cut worm will cross it.

A Forward Step

By H. E. Goodloe

Negro Baptists in Kentucky held all of their annual state meetings in Lexington, Kentucky during the week beginning August 10, 1948, It was indeed inspiring to see this great host of religious leaders meeting in their various groups in the day and at night coming together in one great body at the Woodland Auditorium.

The writer believes this to be one of the forward steps in the steady march of progress that Kentucky Baptists are making and it is hoped that serious consideration will be given to more such meetings because it (1) presents an excellent opportunity for all of the auxiliaries of the parent body to present a uni ted front (2) will soon prevent overlapping in work that is now very much in evidence (3) will cut down cost in transportation which is now very heavy when so many independent meetings are held, and (4) brings together larger numbers thus furnishes better opportunities for more enlightenment and cultural programs.

It was impossible to cover all sessions because of a special interest in Sunday school work; but from all reports made, it seems that auxiliry of the Association did a fine job. Some of the highlights of the sessions were as follows:

1. The musical under the direction of Murry Cruse, was really a high spot in the week's festivities. Lexington and the Baptists of Kentucky should be proud of the gospel feast furnished by this chorus.

2. Moderator Ballew's annual address. During the introductory remarks, he was referred to as a tall oak. When one thinks of his fine work as a leader of the General Association, you can really appreciate the fact that from the hills of Madison County, Kentucky sprang a tender sapling that is naw a giant oak.

3. The wonderful sermons preached by Rev. E. L. Elmore of Bates Memorial, Louisville, Dr. Sandy F. Ray of Brooklyn, N. Y. and Dr. R. W. Riley of Nashville, Tenn. Great men with messages that were food for thought.

4. The fine way in which the ministers and citizens of Lexington demonstrated the age old state ment, "Where there is unity, there is strength." The Baptists of Kentucky were entertained in a manner that certainly represented the hospitality for which Kentucky is noted.

Other leaders who were conspicuous by their work were Reverends Bell of Franklin, Wood of Somerset, Goodloe of Crab Orchard, and Greene of Owensboro. The writer had conferences with them and it seems that their goals are "On to Oakland."

In the final meeting of the General Association, the Moderator urged more unity of purpose among the different organizations. The writer had heard discussed, "The Church Using Its Sunday School." The leader of the discussion seemed much disturbed because so many Sunday schools had not realized that they were only auxiliaries of the church. He further emphasized that Sunday schools that were independent of the parent body did not meet the standard of Baptist churches. Then this thought presented itself. "If the auxiliaries of the local church are church controlled, then using this same line of reasoning, should there be a connecting link with the state auxiliaries and the General Association?

Dead Pea, Bean Vines Good to Build Up Compost Heap

By Dr. Floyd Bralliar

Garden Editor
The Nashville Tennessean

Pea vines (English peas) early snap beans and several other of our early vegetables have either already died or will die soon.

Under normal conditions we have made the last picking and let them decay to add both humus and fertility, but this year things are not normal. If turn these tops under, and if the present weather should continue, they not only would decay rapidly but they would mechanically loosen the soil so much that it would dry out so much that we could not hope to raise a late crop on this soil this year.

To Valuable to Waste

But this material is entirely too valuable to waste, so we recommend pulling all of these plants up by the roots and use them in building a compost heap. Properly bland ed with soil and a little stable manure they will provide first class fertilizer to use on the early spring garden.

We wish to call attention again to the fact that if we wish to plant a fall crop of Irish potatoes they should go into the ground within the next two weeks. This means buy seed at once and get your ground ready for planting. It will pay anyone who can do so to plant some late potatoes even though we only have room for a few hills. Probably the best variety to plant at this time is Irish Cobbler.

Don't forget to plant kale, seven top turnips, mustard and broccoli within the next two weeks. The sooner we get them planted the better results we will have.

Some time ago we suggested planting seeds of cabbage, cauliflower, tomatoes. etc. for plants to set for fall crop. These plants should be ready to set within another week, and this means that we should put our soil in condition for planting within the next week.

Water Each Plant

If the dry weather continues you will have to water each individual plant three or four times after it is set out. But this does not require much time or energy and will probably mean the difference between a crop and a failure. The government report released last week, shows that the average price of food today is the highest it has ever been known in our country More serious still is the fact that the average price of foods is almost sure to go higher before the winter. This being true everyone who can possibly do so should plant all of their available garden space with fall and winter foods. And that most of these vegetables should be planted between now and the middle of August.

A Vote of Confidence

For the past 35 years a private electric company has been serving Norman, Oklahoma, a town of some 19,000 population, and the home of the state university which has an enrollment of approximately 14,000 students.

It recently voted an extension of the electric company's franchise for a period of 25 years, by 1,354 for the franchise and 44 against it.

Apparently Norman believes in the good old American policy of live and let live, and of encouraging private enterprise within its borders.

Peanuts

Successful peanut growers will arrange for machine shelling of seed peanuts and for treating of these seed. Shell and treat seed just before planting.

Dixie runner peanuts paid off in 1947. Yields were good and damage low. Try them on your farm in 1948. Don't forget to set the planter to put down plenty of seed and get a good stand. Thick spacing is necessary for good yields.

Farm Talk with Farm Folk

By Jesse Safley

We will never be able to understand why so many farm families allow their gardens and truck patches to grow up in weeds at this time of year. Outside of the milch cow, the one thing needed most on the farm is a good supply of fresh vegetables.

It is alarming to see so many gardens that have been apparently abandoned because of the dry weather.

However, it is quite obvious that the term "dry weather" has been overworked to cover up laziness and indifference toward raising a garden. This won't hold water as other farmers have not suffered too much for lack of moisture.

Many even fail to grow a garden except in early spring. They claim that the effort and cost are not worth it.

Yes, this year has been a favorable one for those who seek an excuse for not raising vegetables for home use. "It is just about as cheap to buy them" is a common expression, but it won't hold true one time out of a 100.

The trouble about this is that the farm people will not buy the proper vegetables and they in turn are forced to do without many of the things that they should have in their daily diet.

However, the failure to grow a garden is no worse than the failure to harvest it. Too many delay digging potatoes until after a part of them have rotted in the ground. Others allow choice vegetables to mature on the vine or remain there until the quality is lowered for preserving purposes.

We have several gardens recently covered with weeds and there is no evidence that other crops are in the making. There is no way to produce a crop without planting it.

Recent rains have made summer planting possible. Should you be one of those who truthfully lost your spring garden because of dry weather, now is the time to plant the fall crop.
